DISCOVERY OF A GANG OF THIEVES AND RECEIVERS.—At Bath a discovery has been made of a large gang of thieves, who as porters and errand-boys have been carrying on an extensive system of robbery for some time past, by which several of the leading tradesmen of the city have suffered to a large amount. His Worship (F. Dowling, Esq., Mayor of Bath), after several adjournments, deemed necessary by the extent and number of the robberies, fully committed the following prisoners on Monday last:—Herbert Copleston, Thomas Reynolds, James Wilkins, Jacob Archard, Henry Kingston, George Graham, Edward Levier, William Levier, and Jane Levier; the two last named, who are husband and wife, being charged as receivers of the stolen goods, and all the others with stealing. The whole of the prisoners, with the exception of the two elder Leviers, were errand-boys and porters in various establishments in the city; and, from the evidence of an accomplice, named Herbert Sheldon, who was admitted as a witness, it appears that a regular system of robbery has been carried on by them all for a long time past, and the property transferred to the Leviers' house. William Levier, who is a carpenter, has hitherto borne a very high character, and been a regular attendant at church, and the discovery of his connexion with a gang of thieves has naturally created a considerable degree of excitement. The discovery of the gang and of a large quantity of the stolen property was made in the following manner. Mr. R. Withers, of the firm of Messrs Withers, hatters and hosiers, of the Abbey-churchyard, happening to be in Mrs. Hicks's shop, in Northgate-street, observed the porter of Mr. Gutsell, another errand-boy there, throw his cap under the counter and leave the shop immediately he saw Mr. Withers there. This excited suspicion, and Mr. Withers picked up the cap, and then found that it had been stolen from his stock. Wilkins was given into custody, but the police, upon going to Levier's house, where he lodged, to search his box, were refused admission. They obtained a search-warrant, however, and the result of the examination disclosed the fact that the house was a complete *depôt* for stolen property, and not only implicated the Leviers as receivers, but all the other prisoners as thieves, property belonging to upwards of twenty employers having been found there. In the drawers and cupboards, new hats, caps, silk and satin handkerchiefs, scarfs, neck-ties, and other similar articles were found in large quantities, besides bottles of eau de Cologne, sprits of wine, china ornaments, sponges, and other property. Nailed up in the staircase a large hoard was also discovered, containing a number of new books, and a variety of valuable and miscellaneous articles, which had been stolen. Levier at a public-house in the neighbourhood by the female prisoner, with a request to the landlady to take care of it for her, was also found to be full of stolen property, as was also a large bundle by the same prisoner at the house of another neighbour. Several articles were also found pledged at the shops of various pawnbrokers. Amongst the property thus recovered are articles to the value of between £30 and £40 belonging to Messrs. Withers alone. Mr. Hayward, bookseller and librarian, and Messrs. Green and Jameson, chemists, are also amongst those plundered to a considerable extent. Bail was applied for by Levier's solicitor, but refused by the Mayor.

DESTRUCTIVE FIRE AND LOSS OF LIFE AT CHATHAM.—On Saturday morning a de tructive fire broke out on the premises of the Cock public-house, Chatham, in tenure of Mr. Baldock, which spread with alarming rapidity, and resulted in the loss of one life and injury to others. The fire was discovered and extired to rest about midnight, and about an hour afterwards they were alarmed by the cry of fire, which was discovered raging in the lower part of the house, and which burst so rapidly that the inmates with difficulty escaped. Mrs. Baldock, with three of her children, being obliged to get out of the window, before doing which, however, she attempted to arouse a young man who was asleep in one of the bedrooms, which she failed in doing, and he, consequently, lost his life. He had only arrived there on the previous day, and his name is at present unknown. Caroline Bennett, in jumping from the chamber window, received very serious injury of the spine, besides being much cut by the glass, and the servant girl, in escaping from the garret window, likewise sustained considerable injury. The fire, the origin of which is unknown, extended to the adjoining house, in the occupation of Mr. Sibbett, fruiterer, which was entirely destroy ed, and he is, we regret to say, uninsured. Mr. Baldock is insured in the PHŒNIX. The Kent and Sun fire-engines were in attendance, and, by their united efforts, the flames were subdued about four o'clock.

THE QUEEN'S VISIT TO THE MANUFACTURING DISTRICTS.—A meeting of the Salford Town Council was held on Wednesday, when the Mayor, Thomas Agnew, Esq., formally announced to the council that her Majesty had intimated her intention of honouring that borough with her presence on the 10th of October next. He was sure that, with every member of this council, there would be an enthusiastic feeling of gladness at her Majesty's condescension, and that this vast community would do everything in their power to give her Majesty, and the consort of Salford, an ardent and sincere welcome. Mr. Councillor Langworthy then moved "That the council do undertake to defray all the expenses which may be incurred in making the necessary preparations to give a proper reception to her Majesty and his Royal Highness Prince Albert on the occasion of their intended visit." The motion was seconded by Mr. Alderman Jenkinson, and carried unanimously. A committee was appointed, consist of the Mayor, Mr. Alderman Worrall; Alderman Johnson, Alderman Kaye, Alderman Higgins, and Council ors Langworthy, Williamson, Wrigley, Foster, and Gaugall, to make all the necessary preparations.

THE BOROUGH OF SHEFFIELD AND THE PUBLIC HEALTH ACT.—A public meeting, convened by the Mayor (T. B. Turton, Esq.), was held on Monday, in the Town-hall, Sheffield, to consider whether, in the opinion of the burgesses, either the Public Health Act or a General Improvement Act was desirable for the borough. The meeting, which was numerously attended, was presided over by the Mayor. It was unanimously resolved to oppose the introduction of the Public Health Act into the borough, but the meeting declared, by a strong opinion, that, looking at the present state of the town, and its future requirements, the time had arrived when it was desirable to obtain a general and comprehensive act, for the good government, regulation, and management of the borough, and for the better draining, lighting, paving, consumption of smoke (where practicable), and otherwise improving the town, through the medium of the town council; who were requested to apply for such an act in the next session of Parliament. A committee was appointed to confer with the town council in obtaining the act; and it was also determined to raise a fund to guarantee the expenses of applying to Parliament.

THE Conservatives of North Yorkshire have made no less than 160 objections to Liberal voters, whose claim to the franchise arises chiefly from property acquired through the Freehold Land Societies. This year there are upwards of 800 new claims by Liberals to be added to that county, so that at the next election there is little doubt but that either Mr. Newdegate or Mr. Spooner will be rejected. In South Staffordshire, also, there is a large number of new claims by Liberals, and a goodly array of objections by the Tories.

THE AMERICAN REAPING MACHINE.—Mr. M'Cormack will exhibit his machine at work on Monday next, September 1, at Lincoln, to commence at seven o'clock.

SEWING GALES.—At Liverpool, on Sunday morning early, the wind which was highly blowing from the west sprang up into a heavy gale, and continued throughout the day—at times with great violence—accompanied with heavy showers of rain. Ten miles up the country, east, north, and south of the town. The crops of wheat and oats, which had been cut and arranged in shocks, were thrown down, burst open, and scattered over the fields and hedges. From Liverpool, a large number of vessels left the river outward bound, and it is feared that many will have suffered greatly from the storm. The following disasters are mentioned. The *Ariadne*, for Calcutta, has put back with loss of topmast, &c. Also, the *Ocean Queen*, for the Gulf of Kliough, sank in the river; crew drowned. The *John*, of Runcorn, laden with limestone, sank off Taylor's Bank, while in tow of the *Breadnought* steamer; crew lost.

DIABOLICAL ACCIDENT.—A diabolical accident has just been perpetrated at the Maesgo Vale Colliery, so recently the scene of a severe and fatal accident, at Bedminster, near Bristol, occasioned by the parting of the pit rope in the shaft, whereby several of the miners engaged in the works, and who, being precipitated to the bottom, were killed upon the spot. Pending the completion of a new rope which has been ordered, one has been procured from an adjoining colliery. On Monday night last, at twelve o'clock, the man whose duty it was to make an examination of it, did so, and found that it was all right. At about three o'clock in the morning it had to be lowered wi h some colliers employed in the vein, and, on its being again overlooked, immediately prior to the proposed descent, the parties on duty at the pit's mouth found that some diabolical miscreant had cut it with a sharp instrument. The cut, which extended across the rope, penetrated to the depth of a quarter of an inch. It appeared to have been made with a chisel or sharp knife, and it had evidently been cut in an upward direction. It is considered by competent persons that the incision in the rope was sufficiently deep to endanger its safety when the weights came to bear upon it; and it is not improbable, that, had it not fortunately been discovered before the bucket was lowered, several poor fellows would have been dashed to pieces. As soon as the discovery was made, information was conveyed to the Home Office, and Superintendent Inspector Alexander and some other members of the force are engaged in endeavouring to trace out the perpetrator of the villanous act, who, it is sincerely to be hoped, may be brought to justice. It is understood that a meeting of the proprietors of the colliery has been held, and that a reward will be offered.

SOUTHAMPTON PILOTS.—The whole of the ships which take out emigrants according to the plan of the late Sir Robert Harry Inglis, will be cleared at Southampton. The Chamber of Commerce in that town is about to memorial se the Trinity Board to extend the limits within which the Southampton pilots are allowed to take charge of homeward-bound ships. At present the pilots can take a ship to sea from Southampton, but they are not allowed to take charge of a homeward-bound vessel until she arrives off the mouth of the Beaulieu River, which runs into the Solent, to the west of Calshot Castle. Complaints are contin ally made by ship-owners and masters that the commanders of vessels are misled by the sea-pilots who board them in the Channel, and who, being interested in serving the Isle of Wight and other places, represent Southampton as destitute of accommodation for shipping. If the Southampton pilots were allowed to board homeward-bound vessels outside the Needles, this evil would in some degree be remedied. When the Peninsular and Oriental Company's steamers are approaching our shores a few months since, a sea pilot endeavoured to persuade the commander that there was neither a sufficient depth of water nor accommodation for her at Southampton, and that, consequently, the vessel of which he was the captain was bound for that port, having been ordered there by the Ottoman Consul-General.

THE CROPS IN IRELAND.—A large landed proprietor in Ireland, who from his extensive property has better means of obtaining correct information than any of the Government officials, states, in a letter to a gentleman in this town, that the gross agricultural produce of Ireland for the present year will exceed in value by no less than £15,000,000 that of last year.—*Liverpool Mercury.*

THE POTATO CROP IN IRELAND.—The accounts are still to some extent conflicting; but although most of the agricultural reports state that potato disease is making a blackened and withered appearance, all admit that the blight has made very little progress amongst the tubers, and that the great bulk of the extensive and very productive crop remains perfectly sound. A landed proprietor, residing between the town of Hommonstown and Elphin, writes as follows to the *Dublin Evening Post*:—"The potato stalks are withering here—those of the lumper kind, but the root itself is not yet, to any extent, injured. The better description of seed look quite sound and healthy; both stalk and root. In Mayo no fears are entertained by the gentry or farmers for the present crop."

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The English market opened heavily on Monday, affected by the announcement of the failure of Messrs. Dorrien and Rose, and the general surprise and regret The death of the aged senior partner added to the painful impression already existing, it being attributed to the misfortunes of the firm. The immediate cause of the suspension was the failure of Messrs. Gutsell, Gutsell, and Co., whom Messrs. Rucker had assisted to an injudicious extent, upon the security of produce. The speculative rise in the colonial markets has, with difficulty, been lessened up for some months past, by the cautious policy which prices have gradually declined, and with every probability of falling still lower. Other firms in connexion with the two already asserted to are known to be in difficulty. A repetition of failures, which are not accompanied by heavy losses, seems almost periodical, is again threatened. Nor can any other result be anticipated, as long as the speculative system, fostered by the facility of procuring money upon the mortgage of warrants, continues to be the practice of the great majority of the market.

Under these depressing influences Consols opened on Monday at 96¾, and, after receding to 96⅜, closed at the quarter quotation, leaving, however, again on Tuesday to 96⅝, closing at 96⅝ to ¾. Opening at these prices on Wednesday, a purchase by the Government broker afforded firmness to the market, and a rise of ⅛ was registered and maintained till the close. The embarrassments in the Colonial Market transpiring on Thursday, a reaction resulted, Consols declining to 96 for Money. Exchequer Bills have not been affected. India Bonds quite a slight improvement upon the prices of the preceding week. The market at the close was heavy, the following being the official prices:—Bank Stock, 215½; Reduced, 96⅜; Consols, 96⅝; New Three-and-a-Quarter per Cent. Annuities, 98⅛; India Bonds, 41 to 46 p; India, under £1000, 96 p; South Sea Stock (Old Annuities), 96⅛; Consols for Account, 96⅝; Exchequer Bills, £1000, 49 p; Ditto, £500, 49 p; Ditto, Small, 49 p.

Operations in the Foreign Funds on Monday were very limited, Mexican, for the Account, quoting 25¾ 29; Sardinian Scrip, 3 to 4 dis.; Spanish Five per Cent., 21. Mexican, on Tuesday, ranged from 25¾ to 29; and Spanish Five per Cent. Deferred to 2 to 1½ dis. Wednesday was principally occupied in arranging the Account, Mexican and Spanish being nearly the only stocks in which there was anything to settle. Mexican quoted 28¾, but are not quite so good. Spanish, for Cash and the Account, are also a decline. Brazilian scrip quotes lower; the alterations in the other Stocks have not been remarkable. The last declared quotations are—For Brazilian Bonds, 5 per Cent., 99; Ditto, Small, 94¾; Danish Bonds, 1825, Five per Cent., 103; Equador Bonds, 3¾; Mexican, Five per Cent., ex. Jan. Coups., 28¾; Ditto, Account, 28¾; Ditto, Small, 28¾; Russian Bonds, 114¾; Sardinian, scrip, 1¾ dis.; Spanish, Five per Cent., 1840, 20¾; Ditto, Account, 20¾; Ditto, Three per Cent., 27¾; Dutch, Four per Cent., 92¾.

Shares have been again dull. The settlement of the Account, however, appears to have passed off without much difficulty, "continuations" varying according to the credit of the lines, as well as the state of the stock in connexion with the market. The revenue returns upon the leading lines are again very favourable. Closing quotations are:—

ORDINARY SHARES AND STOCKS.—Aberdeen, 9¾; Ambergate, Nottingham, Boston, and Eastern Junction, 4¾; Caledonian, 9⅞; Chester and Holyhead, 14¾; Eastern Counties, 6¾; Great Western, 76¾; Lancashire and Yorkshire, 47¾; Ditto, Fifths, 2¾; Leeds, Northern, 6¾; London and Brackwall, 6¾; London and Brighton, 86¾; London and North-Western, 117; London and South-Western, 78⅜; Manchester, Sheffield, and Lincolnshire, 23¾; Midland, 40⅝; North British, 5¾; North Staffordshire, 7⅜; Oxford, Worcester, and Wolverhampton, 15¾; Scottish Midland, 7; Shrewsbury and Birmingham, Class A, 7; Ditto, B, 4¾; South-Eastern, 10⅜; South Yorkshire and River Dun, 11; York, Newcastle, and Berwick, 16¾; York and North Midland, 16¾

LINES LEASED AT FIXED RENTALS.—Buckinghamshire, 17¾; Leeds and Bradford, 101¾

PREFERENCE SHARES.—East Anglian, 1¾; Great Northern, Five per Cent., 13⅝; London and Brighton, New Guaranteed, 141; London and South-Western, New, 12¾; Manchester, Sheffield, and Lincolnshire, Quarter shares, 1¼; York and North Midland (P. and S. Purchase), 8⅜.

FOREIGN.—Boulogne and Amiens, 10¾; Central of France, 17; Dutch Rhenish, 2¾; Great Luxembourg (Liége Line), 18⅞; Northern of France, 14¾; Rouen and Havre, 9¾; Sambre and Meuse, 3.

THE MARKETS.

CORN-EXCHANGE.—Since our last report about 1300 quarters of new English wheat have appeared on sale, chiefly from Essex and Kent, in excellent condition. Although the show of samples has been comparatively small, the demand for a limited extent has ruled heavy, at a further decline in the quotations of 1s per quarter; and clearances have been with difficulty effected. Fine foreign wheats have moved off slowly, at previous currencies; but low and middling qualities have been offering in greater terms. Scarcely any English barley has come to hand, but the supply of foreign has been reasonably extensive. Most descriptions have sold heavily, at 1s per quarter less. In malt very few transactions have taken place. Oats have gone a shade lower. In beans, peas, Indian corn, and flour, next to nothing has been doing.

Arrivals this week:—English and Welsh wheat, 1,300 qrs.; ditto, white, 450 qrs.; Norfolk and Suffolk, red, 80s to 42s; ditto, white, 36s to 42s. rye, 32s to 36s. grinding barley, 21s to 24s; distilling ditto, 25s to 29s; malting ditto, 30s to 35s; Norfolk and Lincoln malt, 44s to 50s, grey peas, 30s to 32s; maple, 32s to 36s; Chevalier, 34s to 36s; Yorkshire and Lincolnshire feed oats, 17s to 20s; potato ditto, 19s to 22s; Scotch and Cork, black, 16s to 18s; ditto, white, 17s to 21s; tick beans, new, 26s to 30s, ditto, old, 29s to 31s; grey peas, 32s to 37s; maple, 32s to 37s; white, 36s to 37s; harlots, 36s to 38s per quarter. Town-made flour, 34s to 36s per sack. Seconds, 30s to 32s; Stockton and Yorkshire, 30s to 32s per 280 lb.—*Faversham:* Damaged red wheat, —s to —s; white, —s to —s; barley, —s to —s; oats, —s to s; beans, —s to —s; peas, —s to —s per quarter. American flour, 19s to 20s per barrel Canada, —s to —s per barrel; French, 37s to 38s per sack.

The Seed Trade.—The general demand has ruled very inactive, but we have no change to notice in the quotations.

Linseed, English, sowing, 40s to 45s; Baltic, crushing, 40s to 42s; Mediterranean and Linseed, English, sowing, 42s to 46s per quarter; coriander, 18s to 24s per cwt; brown mustard, 6s to 10s; white ditto, 8s to 12s; rapeseed, English, new, 24l to 25l per last; ditto, foreign, new, 23l to 24l per last of ten quarters; linseed cakes, English, 4l 15s to 4l 16s per ditto foreign, 4l to 4l 5s per 1000; rape-seed cakes, 4l to 4l 10s per ton; canary, 60s to 64s; hempseed, 37s per quarter; English linseed, 38s to 40s per bushel; foreign ditto, 34s to 36s per bushel; English rapeseed, 44s to 46s per last of ten quarters; coriander, 18s to 20s per cwt.

Provisions.—The demand for Irish butter has become inactive. In prices, however, we have no material change to notice. Dutch has given way 4s per cwt, with a heavy demand. The top quotations are 78s per cwt. Irish bacon firm, and in demand, and most other kinds of provisions support late rates.

Hops.—The demand has been quiet, at barely late figures. Sparm and southern qualities are quite as dear.

Tallow.—An advance of 3d per cwt has taken place in the value of this article. P.Y.C., on the spot, is quoted at 34s 6d to 35s 9d for new; and 36s to 36s 3d for old. Town tallow, 37s 3d to 38s per cwt. Rough fat is 1s 6d per 8 lb. The shipments from St. Petersburgh, to annul, per last week, were 2,200 casks.

Oils.—Linseed oil has been in request, at about stationary prices. East India is worth £ s. d. per ton. Rape is dull, at barely late quotations. In fish nearly the same business is doing. Cocoa-nut oil is 4s per cwt. Sperm and southern qualities are quite as dear.

Coals.—Hetton's West Hartley, 15s; Hetton's Harrington, 15s. New Tanfield, 15s. Acorn Hetton, 15s. 6d. Wylam, 15s. Lambton's, 15s. 6d. Harton's, 15s per ton.

Hay and Straw.—New meadow hay, 4l 10s to 5l 5s; old ditto, 4l 15s to 5l 15s; new clover, 4l 5s to 5l 5s; old ditto, 5l 10s to 6l 6s; and straw, 1l 18s to 2l per load.

Hops.—For all kinds, the demand is in a very inactive state, and late currencies are with difficulty supported. The duty is called £100,000 to £120,000.

Wool.—Although the wants of the manufacturers are moderately supplied, and we have large arrivals from our colonies, bodders are firm, and previous rates are readily obtained

Potatoes.—Large supplies continue to be received from Essex, Kent, &c., whilst the demand is in a very sluggish state, at from £2 5s to £3 10s per ton.

Smithfield.—Sheep and lambs have moved off steadily, at full prices. In other kinds of stock, very little has been doing:—

Beef, from 2s 4d to 3s 6d; mutton, 2s 6d to 3s 10d; lamb, 3s 10d to 4s 10d; veal, 3s 6d to 4s 6d; pork, 3s 4d to 4s 6d per 8 lb, to sink the offals.

Newgate and Leadenhall.—The supply of meat has been in a very depressed state, and late rates have been with difficul y supported.

Beef, from 3s 4d to 3s 8d; mutton, 3s 4d to 3s 8d; lamb, 4s 6d to 5s; veal, 3s 4d to 4s 6d; pork, 3s 6d to 4s 6d per 8 lb, by the carcase. R. HERBERT.

THE LONDON GAZETTE.

FRIDAY, AUGUST 22.

WAR-OFFICE, AUGUST 22.

1st Regiment of Dragoon Guards: Lieut. Hon. Charles Bruce to be Captain, vice Towlan; Cornet J H Anderson to be Lieut, vice Carew. 8th: Captain J G Archer-Burton to be Captain, vice Heywood.

DR. HOWARD ON SALT
Fourth Edition, much enlarged, 8vo, bound, 5s 6d; by post 5s.
SALT, the FORBIDDEN FRUIT or FOOD, the CHIEF CAUSE of DISEASES of BODY and MIND as truly taught by the Wise Men of Egypt and by Scripture. The mystery of the Pillar of Salt, that is the Absorbation of declination, now fully explained, showing that from childhood, brought up under this system, a new race of wise men and women will arise as in transcendental ages. Little salt is needed; a grain or two the Wise Men and Women of Egypt and Scripture used. Wise Women! and that for the same reason. Ladies! you have the power over the superstition and world disease, ugly and injurious! Will neither of attention: we doubt not and Dr Howard—a Invalid many Physicians of Europe, Asia, and America. Of entrance with interest, and importance." Asiatic Journal "Worthy of immortality."—Lancet. "Papers and Co., 23, Paternoster-row; post-free for 36 stamps of the Author, 6, Upper Gloucester-street, Dorset-square.

OFFICIAL CATALOGUES.—TO ADVERTISERS.—The Contractors for the Official Catalogues beg to inform the Public that 250,000 copies have now been issued, and that 100,000 additional Copies will be required. The numbers required until the close of the Exhibition in October, at a reduction of Fifty per cent. on the present charges. The Contractors would further call attention to the fact, that the Catalogue, being carried, will probably be kept as a memorial of the Exhibition, and forms, therefore, a very valuable mode of advertising.

TWO SISTERS, or a LADY with One or TWO DAUGHTERS, can be RECEIVED into the FAMILY of a PROFESSIONAL GENTLEMAN, where all the comforts of home, refined society, and the best instruction are offered. The house is in a quiet and very healthy town in Norfolk, a convenient distance from the Metropolis. Unexceptionable references will be given and required —Address, by letter, to Y. M. A., at Mr. G N STEWARDSON'S, Saloner, Fakenham, Norfolk.

SCARBOROUGH. "Queen of British Watering-Places."—SHARPIN'S, CROWN HOTEL ESPLANADE, contiguous to the Spa, Sands, Cliff-bridge, and Pleasure-Grounds. Families will find the above extensive Establishment most agreeably situated, commanding a splendid view of the Ocean, combining every comfort and convenience. Table d'hôte at Five o'clock. Private Dining Table and Baths in the house. An Omnibus and Cabs at the Railway Station.

THE ISLE OF MAN.
THE ISLE of MAN, Six Hours' Sail by Steam from Liverpool, Seven from Dublin, and Twelve from Glasgow, deserves to be generally known as a WATERING-PLACE and PERMANENT RESIDENCE: no portion of her Majesty's dominions being more healthful, more beautiful in its scenery, or more free from taxation. There are neither harbour dues, turnpikes, poor-rates, nor assessed taxes in the Island, as well as the ever-changing Air and Baths are attainable at a cheaper rate than elsewhere. A Sketch of the Island, containing Information, will be forwarded, on application (the only one postage stamp) to S B ROOKE, Esq., Douglas, the Secretary to a Committee appointed to call attention to the Island as a Watering-Place, &c. &c.; or, to C. MITCHELL, Red Lion-court, Fleet-street, London

REGENT HOTEL, LEAMINGTON.—THOMAS JEFFERY begs respectfully to acquaint his Patrons that this Establishment has recently undergone many extensive alterations, by which he is enabled to offer improved accommodation at very moderate charges. A tariff is placed in each room, stating every item necessary to calculate the expenditure of those who may be pleased to favour the Proprietor with their support. In conducting this, the object of the Proprietor has been to satisfy the Public generally of the great advantages this Hotel now offers.

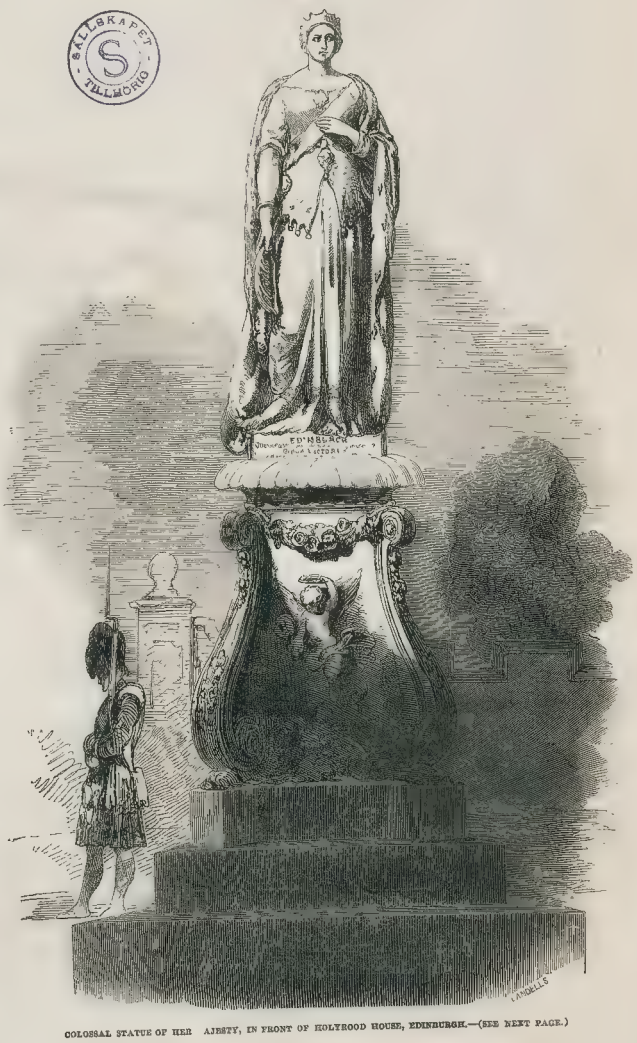
ANOTHER "EL DORADO."

THE world is startled by a new announcement. California, if some recent intelligence which appears in the daily papers, do not turn out to be a hoax, is no longer the only "El Dorado." Brother Jonathan has of late, to use a popular phrase, "been taking the shine out of us." He has been going ahead in every direction. The discovery of the gold of California was the first great achievement by which of late years he astonished the Old World and the New; and to this feat he has lately added Mr. Hobbs and his picklocks, and Commodore Stevens and his yacht. As regards locks, the English makers seem to be fairly beaten by the acute, patient, and skilful Yankee; and, "unkindest cut of all," on the superiority of our naval architecture, the late doings on the shores of the Isle of Wight show that we have much to learn from our young and vigorous friends of America. But all in good time. We have made a beginning already. If the Australians have not been playing a scurvy trick upon us, we have matched Brother Jonathan's auriferous region by discovering gold in Australia, as plentiful as it is beyond the Rocky Mountains. Bramah and Chubb—or there is none of the old stamina left in England—will speedily set all future Hobbses at defiance, by the invention of new locks; and as for the yachts, so far from being aggrieved by the easy victories obtained over our best boats by the *America*, the public already looks upon the gallant Commodore Stevens as a benefactor, and considers that an immense improvement in the construction of our vessels will be the almost immediate result.

But the golden question is at present the more engrossing one, and has thrown Hobbs and Stevens and their achievements in the shade. Australia, a land of which the mineral is only surpassed by the pastoral wealth, and whose copper mines, the richest in the world, have prepared the public to believe in the existence of many yet undiscovered sources of mineral treasure, is said to suffer as great a paroxysm of the gold fever as ever afflicted America; and if the accounts which have been published in the *Sydney Herald* of the 20th of May last, and which found their way to London during the present week, should be wholly or even in part confirmed, the contagion will spread to England, and the emigration to Australia will show a large increase. It is stated that the country, from the mountain ranges beyond Bathurst to an indefinite, or at all events an undefined, extent inwards, "is one immense gold-field." The facts, which are affirmed on the authority of a local journal, represent that a Mr. Hargrave, to whom the discovery appears to be mainly due, accompanied Mr. Stutchbury, the Government geologist, to the "diggings," and "with his own hands washed a pan of earth, in his presence, from which twenty-one grains of fine gold were produced; that he afterwards "washed several baskets of earth, and produced gold therefrom." Nor is the gold only to be found in grains. A young man, the son of a brewer, fanned the previously existing excitement in Sydney into a flame, by arriving from the diggings with a lump of pure metal, weighing eleven ounces, which he sold for £30. An old man was still more fortunate, and arrived in Sydney with several lumps of the pure metal, weighing in all from two to three pounds, and worth from £100 to £160. Mr. Kennedy, the manager of the Bathurst branch of the Union Bank of Australia, visited the diggings with two gentlemen, and each of the three was rewarded by the discovery of a lump of metal, the weight and value not stated; and a few handfuls of loose earth brought from the bed of a creek by Mr. Kennedy, having been sifted and analysed, produced numerous grains of gold, forming, altogether, a quantity as large as a pea. The consequence has been, as we are told, that Bathurst and Sydney, and all the country round, have gone as mad for gold as ever the Yankees did, and that high and low, rich and poor, master and servant, magistrates and policemen, landsmen and seamen, men, women, and children, have all set out for the diggings. "People of all trades, callings, and pursuits," says the *Bathurst Free Press* of the 17th of May, "have been transformed into miners; and many a hand which has been trained to kid gloves, or accustomed to wield nothing heavier than the grey goose quill, has become nervous to clutch the pick and crowbar, and rock the cradle at the mines." The blacksmiths of Bathurst speedily got rid of their stock of implements, reserving, of course, sufficient to try their own fortunes with a more tempting metal than iron. "Such is the intensity of the excitement," says our Bathurst contemporary, "that people think of nothing but gold, and the roads are literally alive with newly made miners from every quarter; some armed with picks, some with shovels, and not a few bearing wash-hand basins, tin-pots, and cullenders." The first great result of the gold fever is said to have been a rapid rise in the price of provisions of every kind;—flour from 28s. to 45s. per cwt., and other articles of prime necessity in a similar proportion.

It is possible that there is some exaggeration in the hasty and imperfect accounts which have reached England, and it is also possible that the whole story is a fabrication; but it is, at the same time, not improbable that these accounts may be strictly true, and that Australia may yet rival California in the production of gold. Further information will be anxiously expected; and, until it arrives, it will be unwise to indulge in speculations as to the probable consequences of the discovery upon the fortunes of the colony, or upon the commerce of the world. Our old Europe seems to be getting stale. The divine command to increase and multiply, and replenish the earth, has hitherto been but imperfectly obeyed. But what the natural emigration of races in search of homes and subsistence has failed to effect, in peopling the remotest ends of the earth, seems about to be expedited by the more captivating and exciting lust of sudden wealth. The shores of the Pacific were for the first time peopled by the old races of the world, in consequence



COLOSSAL STATUE OF HER MAJESTY, IN FRONT OF HOLYROOD HOUSE, EDINBURGH.—(SEE NEXT PAGE.)

of the discovery of the treasures of California; and the islands of the Pacific, and that splendid continent of Australia itself, seem as if they were about to be indebted to the same cause for an immense accession of the strength which springs from the presence of active, enterprising men. The Northern and Eastern hemispheres have hitherto had all the glory and power of civilisation. The "world," till within a hundred years, or even less, was supposed to lie within those boundaries. All beyond was undeveloped. But the West and the South are now starting into rivalry with them. The new is confronting the old, and claiming its full space in the world, and its full share in the fortunes of humanity. It would certainly be a strange result, if gold—after having served its end in attracting to the remotest and hitherto unpeopled regions of the globe the too crowded swarms of the earlier settled countries of Europe and Asia—should ultimately be discovered to be so plentiful as to be no longer the most precious of metals. Yet even this result, though extraordinary, does not seem at all unlikely in the extraordinary times in which we live. But what if we should have been hoaxed in this matter? The next arrival from Australia will enable us to form an opinion. In the meantime, we can but wonder—and wait.

STATUE OF HER MAJESTY AT EDINBURGH.

THIS graceful statue of the Queen was placed upon its pedestal in front of Holyrood Palace (about 100 ft. in advance of the main entrance), on the 22d ult., "in commemoration of her Majesty having occupied that ancient edifice as a residence in 1850."

The statue is the production of Mr. Handyside Ritchie. Her Majesty wears a tiara, and a regal robe embroidered round the collar with the trefoil ornament, and entirely surrounded by a thistle *bordure*. The folds of the drapery are disposed so as to show the entire figure; and the back view, difficult in such heavy draping, is well managed. Her Majesty's left hand is pressed to her breast, and on her right hand she bears a palm branch, emblematic of her peaceful rule. Her countenance is marked with simplicity and dignity, and the profile of the entire features and figure is seen with queenly effect on entering the Palace-yard, to the north of the statue.

The pedestal is picturesquely ornamented. It is ogival in form, and is richly ornamented with foliage and wreaths of fruit and flowers—the four sides being paneled, and having infantile figures in alto-relievo personating the Seasons. Spring is scattering rose-buds, and is surmounted with a wreath of snow-drops, primroses, violets, &c. Summer is laden with roses, and has her accompanying wreath of sunflowers, &c. Autumn, with his horn of plenty, rejoices amid golden grain and ripe fruits. And Winter, with his dried faggot and withered leaf, is merry amid mistletoe, holly, ivy, palm, and laurel. The whole of the detail in the pedestal is admirably designed and exquisitely chiseled; and the ornamentation of the pedestal, instead of detracting from, enhances the value of the statue by contrast, investing it with additional repose and simplicity.

The figure is colossal, being 9½ feet high, and, with the pedestal and sub-plinth, measuring 20 feet in height. Upon the latter is inscribed:—

EDINBURGH
Commemorates the occupation by
QUEEN VICTORIA
Of her Ancestral Palace of
HOLYROOD.
29 August, 1850.

The stone is from the liver rock of Redhall Quarry: and its light, warm tint contrasts well with the cold grey tone of the surrounding buildings.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The question of the candidateship of the Prince de Joinville for the Presidency of the Republic, which has hitherto come before the public only in vague rumours, has at length assumed form and consistency, in consequence of the result of an interview between M. Guizot and the members of the Orleans family, at Claremont, last week, on the subject, having been published in the journals.

M. Guizot and the partisans of the late ex-King are opposed to the Prince presenting himself for election to the Presidency, on the ground of its being an act of a piece with the Revolution, which overthrew the Orleans *régime*; and a step opposed to, and inconsistent with, the principles on which was founded the Monarchy of July.

The Duc de Nemours, who was the spokesman of the ex-Royal family at the interview, when pressed by M. Guizot for a definite explanation of the family policy or intention in the matter, would give no explicit avowal of either; but felt it to be understood that they neither accepted nor rejected the offers of support which might be or had been made to M. de Joinville, as a candidate for the Presidency; so that they might advance or back out of the position in which they found themselves at the near approach of the contest, according as they might deem fitting and necessary.

In fact, vacillating expediency, without any particular regard for the dignity of their attitude or the consistency of their previous political conduct, proves prominently forth as the course which the present representatives of the House of Orleans had marked out for their adoption at the approaching momentous crisis in the political history of their country. Nothing bold, original, or able, was shown as the result of the family councils but a characteristic hunt of power, feebleness of purpose, and readiness to resort to any unprincipled petty-fogging cunning means of success which chance medley may offer. Whilst the Prince de Joinville and his family continue in this inconsistent attitude, the Paris journals discuss the question with much earnestness. The *Journal des Débats* has pronounced in favour of the Prince's claims, and in opposition to the candidateship of Louis Napoleon, which it says is unconstitutional, and must be repelled. Considerable importance is attached to the step in question, and it is supposed to have been written with the consent of the Orleans family, whose organ the *Débats* is acknowledged to be. Louis Napoleon is fully aware of the hostility of the Assembly to his Government, and of the intrigues going on by various parties to prevent his re-election; but, relying upon the support of the people, his friends say he will in nothing rashly to increase the bitterness of his enemies, but will wait with firmness the decision of the country.

The propriety of the revision of the Constitution still engages the Provincial Councils, and out of 86 of those bodies, not less than 60 have declared in favour of that measure, while only five voted against it.

The court-martial at Lyons for the trial of political prisoners has at length [illegible] its labours. The questions examined by the court were:—1. Were the accused guilty of having taken part in a plot at Lyons for the purpose of destroying or changing the Government? 2. Was any plot or [illegible] formed by no act committed or commenced for preparing the execution of it? 3. Were there [illegible] of having taken part in a plot formed at Lyons, [illegible] object of destroying or changing the Government? 4. Was the accused guilty of having [illegible] plot followed by an act committed or commenced for preparing the execution of it? 5. Were the same accused guilty of having formed part of a [illegible] band? As to the first question, the court by a majority of seven to six declared that the accused were *not guilty*, and that the others, 36 [illegible] including those in flight, were *guilty*.

The sentences passed on the accused declared guilty were in virtue of articles 87, 89, and 91, of the Penal Code, 13 of the decree of 28th July, 1848, on civil [illegible], and 463 of the Penal Code. Of the guilty, [illegible] respect to some of the accused, [illegible] to others, five years' deportation to a fortress, and 100 francs' [illegible] fine. The sentences were as follows:—

[illegible] Alphonse Gent, Albert Ode, Longemaison, Du Saint Prix Antoine Roy [illegible], Sulc. [illegible].
[illegible] Pierre Malleval.
[illegible] imprisonment, five years' deprivation of civil rights, and 100 fr. fine—Mevin [illegible], Jacques Chapuis, five years' deprivation of civil rights, and 100 fr. fine—Bertolot.
A year's imprisonment, 100 fr. fine, and two years' deprivation of civil rights.—Sauve, Boniface Chapuisier.
[illegible] a like imprisonment and two years' [illegible] of civil rights.—Dupot, Carle.
[illegible] year's imprisonment and 50 fr. fine [illegible] deprivation of civil rights.—[illegible] Jean Baptiste Pierre Marie Calle [illegible] Bellegarde; it is more severe than [illegible] ordinary imprisonment, and subjects the culprit, after his release, to the surveillance of the police for life.]

Twenty-two of the prisoners have appealed against the decision of the court-martial. Their counsel are to be called before the Council of Advocates at Lyons, to explain and justify their conduct in throwing up their briefs at the last trial.

Paris also contributes its quota to the conspiracies against the Government, one of which has this week been discovered, in which the Red Republican exiles in London are also concerned; and sixty-five persons have been arrested, among whom is the late secretary to M. Ledru-Rollin.

[illegible] or of Beaune has been suspended for three months for [illegible] [illegible] Cochin, while distributing prizes at the college in that town.

[illegible] the troops for Lyons were reviewed in the Champ de Mars by [illegible] previous to taking his farewell of the army, after 46 years' [illegible].

[illegible] the Republic paid [illegible] on Wednesday.

AUSTRIA.

A series of decrees, dated August 20, has been issued by the Emperor of Austria to the members of the Cabinet, on the subject of Ministerial responsibility, and on the necessity of considering the possibility of maintaining the Constitution of May 4, 1849, which are constructed as the first grand step backwards to absolute government.

The principal of these decrees are as follows:—

MOST HIGH CABINET LETTER TO THE MINISTER PRESIDENT

Dear Prince—In reviewing the [illegible] responsibility of the Cabinet as it now stands is devoid of legal distinctness and exactitude, my duties as a Monarch induce me to relieve Ministers from the doubtful political position in which, as my counsellors, and as the highest executive organs, they are now placed, by declaring that they are responsible to no other political power than the Throne.

1. The Cabinet has to swear in my hands unconditional fidelity, as also the engagement to fulfil all Imperial resolutions and ordinances.

2. The Cabinet will in the new position have punctually to carry out my resolutions concerning all laws, ordinances maxims of administration &c., whether they have been considered necessary or judicious by Ministers, or whether the latter have been directed by me to frame and propose them.

3. The Cabinet and each Minister in his department is responsible to me for the exact observance of the existing laws and Imperial ordinances in their administration. To each Minister is entrusted the direction of that branch of the administration for which he is charged. I however, reserve to myself the right of issuing more exact regulations on this point.

4. The ministerial counter-signature is in future confined to the publication of laws and Imperial ordinances, and will be the act of the Minister President, or that of those Ministers with whose branch the matter in question is connected. The Director of the Chancellory of the Cabinet will, with the leading formula of "By most high command," Minister will stand towards the same.

These counter-signatures are as a warranty that the appointed forms have been observed and that all Imperial ordinances have been punctually and exactly carried out.

5. On the publication of laws and Imperial ordinances, the words "after having heard my Cabinet" will be substituted for "on the proposition of my Cabinet."

Schönbrunn, 20th August, 1851. FRANZ JOSEPH. (M.P.)

MOST HIGH CABINET LETTER TO THE PRESIDENT OF THE REICHSRATH (COUNCIL OF THE EMPIRE)

Dear Baron Krauck, You will learn by the subjoined copy of my ordinance to the Cabinet the resolutions which I have taken relative to the responsibility and to the future position of my Cabinet. These resolutions induce me to introduce some changes in the statutes of my Reichsrath.

1. The Reichsrath is from this time forward to be considered as my Council and the Council of the Throne.

2. In consequence of this declaration, drafts of laws, ordinances, or other such matters have not to be presented by the Cabinet to the Reichsrath for its opinion, but always to me. A preliminary to part 7 of its statutes. I reserve to myself the right of demanding the opinion of the Reichsrath, and of directing the discussion of matters under my own immediate direction, or that of its president.

3. I reserve to myself the right of commanding the attendance of Ministers and their deputies at the councils of the Reichsrath, according to circumstances and necessity.

The alterations in the order of business and in other matters arising from the ordinances, you have to lay before me without loss of time. If drafts of law, which have been forwarded by the Cabinet to the Reichsrath, are still under discussion, due notice is to be given to me; and, under all circumstances, the results of the deliberations of the latter are to be laid before me.

Schönbrunn, Aug. 20, 1851. FRANZ JOSEPH (M.P.)

BELGIUM.

The Belgian ministry has been defeated in the Senate upon the law for the regulation of property. An appeal to the country is expected, as, from the present state of parties, a new Cabinet could not be formed.

SPAIN.

We learn from Seville, under date the 28th ult., that her Royal Highness the Duchess de Montpensier, sister of the Queen of Spain, was safely delivered of a princess on that day.

PORTUGAL.

We have advices from Portugal to the 26th ult. Saldanha's government was gradually acquiring a stability little contemplated when he first assumed the reins of power. Public credit was also gaining ground. A conspiracy had been formed by the Cabralists to effect a military revolution; but, before the day arrived when the plan was to be put into operation, Ministers were apprised of the whole plot, and by their energetic measures it was soon suppressed. A charge had been made against Le Ferrao, the Minister of Finance, of having some years since, while Procurador da Fazenda, received a bribe from the tobacco contractors. M. Ferrao immediately begged her Majesty to accept his resignation, that he might vindicate his honour before a jury of his countrymen. This was acceded to by the Queen, and his petition has been placed on the hands of the Minister of Marine until the action shall have been tried, when there is every reason to believe will fully acquit him of the foul accusation, when he will resume the duties of office.

The yellow fever was raging at Oporto: it was conveyed there by a ship from the Brazils.

UNITED STATES.

We have accounts this week from New York to the 23d ult., and from Havannah to the 17th ult., which are of considerable interest.

The Spanish war-steamer *Habanero* had captured four boat-loads of men, and 50 of them (Americans) had been publicly shot in the presence of 20,000 spectators. The Governor-General had sent 800 men to intercept Lopez, who had landed at Bahamas with 450 men.

The enthusiasm in the Southern States of the Union in reference to Cuban affairs was very great. Fears were entertained of disturbances in New Orleans, and the military were held in readiness to act. At New York a great mass meeting had been held, and the streets were filled with banners bearing the inscription "The blood of 50 Americans cries for vengeance." The 50 men shot were a portion of the Lopez invaders which had become [illegible] from the main body. Their names are published in the New York papers.

From Washington we learn that the President and several of the leading members of the Cabinet were absent, recruiting their health and energies for the approaching session of Congress. Both President Fillmore and the secretary of the Interior made speeches at their reception at Stanton, in Virginia.

The question of the next Presidency continues to be much canvassed in political circles. All, however, seem to agree that neither on the Whig side, where Webster or General Scott will be victorious, seems doubtful. Mr. Webster has set out on a tour round the White Mountains. His health has greatly improved since he left Washington.

The second session of the Baltimore Whig Convention was held on the 15th ult., at which resolutions were passed to make Whig nominations for every office for which there is the slightest chance of success.

The results of the recent elections in the Southern States do not seem to have had the effect of cooling down the ardour of that portion of the people of South Carolina who are favourable to a dissolution of the Union. They are more than ever in favour of secession.

Father Mathew had arrived at Erie, and assisted in the consecration of a new church in that place. At the close of the service, crowds of his countrymen flocked round the altar, to receive the pledge at his hands. A dinner was given in his honour in the evening.

We observe in the foreign papers, that the well-known novelist, Mr. G. P. R. James, was considerably injured by being thrown from his carriage while driving an unruly horse, at Stockbridge, Massachusetts.

The cholera has broken out with great virulence in Cuba, in a very malignant form, and also in some of the interior towns of the state. The cause of its appearance is supposed to be the extensive heat of the weather, and continued dewy rains.

GOLD IN AUSTRALIA.

(To the Editor of the ILLUSTRATED LONDON NEWS.*)*

SIR,—It may interest your readers to learn something of the Bathurst district of New South Wales, more particularly because the last page of the last week in connexion with the reported discovery of auriferous [illegible].

Bathurst is both a town and a county of New South Wales, the former situated 114 miles distant by road to the westward of Sydney, in W.N.W. direction. It is approached by the great western road, which—at 36 miles from the metropolis, after passing through the town of Penrith, and crossing the river Nepean—ascends, by laborious inclines, the elevated mountain land called the Vale of Clwyd. Thence it passes through some romantic gorges, to which the name of Mount Victoria has been given, from the resemblance the vast precipices bear to the enormous ruins in the midst of solitude. At 86 miles from Sydney we have [illegible] Creek, a pretty [illegible] grassy vale; and a little beyond, [illegible] Hill, both [illegible] above the level of the sea. The ground now assumes a more fertile appearance, being clothed with better grass and more productive [illegible] of timber; and, on emerging from the [illegible] the "Badger Brush," the traveller, at the 100th mile-stone, is first gratified with a sight of the Plains of Bathurst, and eight miles farther on he reaches the open country, and passing through many finely-situated farms, crosses the river Macquarie, and enters the settlement, which, be it remarked, is in high regions, not less than some 1500 feet above the sea.

The Plains, so called, are undulating downs, fringed by the forest, and comprising a territory of some 30 miles in circumference; they are very fertile, and renowned for their excellent breeds and sheep, their dairy produce, and wheat of first quality.

The country was located some thirty-five years since, and occupied by very respectable emigrant settlers, amongst whom the most extensive proprietor is Major-General Sir [illegible].

The electoral district of Bathurst, returning one member to the Legislature, contains a population, by the census of March last, of 4602, and the town itself, 2252 persons.

The latter is a great emporium for the supply of all articles of consumption to the vast squatting districts that surround it, and requires on y the advantage of railway communication with Sydney to go most rapidly ahead; and, with the copper mines in its vicinity, to say nothing of this new feature of gold, it will take a pre-eminent position amongst the towns of the interior. It already enjoys a local newspaper, and is a pleasant town for residence.

The locality of Summerhill, where the gold and other minerals have been discovered, is to the south of the settlement, on Campbell's River, and from the annexed advertisement it will be perceived that the work is progressing, and hands are wanted.

Bathurst Copper-Mining Company.—Wanted, a competent person to act as Captain, or Agent at the Summerhill Mine, Campbell's River, near Bathurst. Testimonials as to capacity must be forwarded with the application for the situation to the undersigned. Miners [illegible]

[illegible]

LOCKS AND LOCK-PICKING.

PICKING OF THE BRAMAH LOCK BY MR. A. C. HOBBS

IN our former articles on "Locks and Lock-picking," published in the ILLUSTRATED LONDON NEWS of the 2d and 9th August respectively, we described the process by which Mr. A. C. Hobbs, the American lock proprietor and lock-picker, had succeeded in picking a Chubb lock, in the presence of a committee of gentlemen, and how he had afterwards accepted the challenge to pick Mr. Bramah's lock—the same which has been hanging in his window in Piccadilly for the last twenty years—for a prize of 200 guineas. We also ventured an opinion that Mr. Hobbs would succeed in his undertaking, as he had in all previous ones of the kind; being convinced that no lock which depended for its security upon one system of combination parts—that is, not having any secondary or tertiary combination parts beyond the reach of the key-hole could resist the attack made upon the principles upon which he acted. We have now to announce that what we antic.pated has turned out to be the fact. Mr. Hobbs has picked the famous Bramah lock, and has done so upon a process so simple, as almost to be termed ludicrously simple, but that it is so unerring as to occasion feelings of anxiety to all who have treasures to keep under lock and key. It is always best to know the truth, however; and, therefore, as we did in the case of the Chubb lock, so now in the case of the Bramah, we shall endeavour to explain the whole process by which its supposed invulnerability has been disproved.

We will first describe the principle of the lock itself—that is, the combination parts, which constitute its supposed security; the leverage for throwing out and drawing back the bolt being upon the usual method.

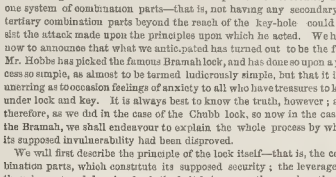


Fig. 1 represents the section of a circular block or barrel of brass, having a cylindrical cavity throughout, and divided from the centre into six or more compartments, separated by grooves passing also quite through its length. In each of these compartments a steel slider is fitted, somewhat of the shape marked No. 6, in Figure 4. These sliders, in connexion with a steel plate (G), running parallel to the horizontal section of the brass barrel, constitute the obstructive works against turning the barrel, unless with instruments adapted to adjust them respectively to their proper positions for that purpose. The upper parts of these sliders project into the cylindrical cavity, and are elevated to be flush with the prominence in the centre of the barrel, which is the keyhole (Fig. 2). The notch at the bottom of this prominent portion of the barrel is to receive the bit or lever of the key, for the purpose of turning it round.

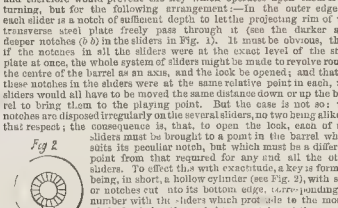
With respect to the sliders. They each play up and down the tube, through notches in the steel plate (shown more distinctly in Fig. 3), which, being firmly fixed in the barrel, would inevitably prevent the said sliders from moving round on the centre of the barrel as an axis, and therefore would prevent the key which operates upon them from turning, but for the following arrangement:—In the outer edge of each slider is a notch of sufficient depth to let the projecting rim of the transverse steel plate freely pass through it (see the darker and deeper notches (b b) in the sliders in Fig. 1). It must be obvious, that, if the notches in all the sliders were at the exact level of the steel plate at once, the whole system of sliders might be made to revolve round the centre of the barrel as an axis, and the lock be opened; and that, if the notches in the sliders were at the same level in one plane in each, the sliders would all have to be moved the same distance down or up the barrel to bring them to the playing point. But the case is not so: the notches are disposed irregularly on the several sliders, no two being alike in that respect; the object of which, as has been shown in the book, each of the sliders must be brought to a point in the barrel which suits its peculiar notch, but which must be a different point from that required for any and all the other sliders. To effect this with exactness, a key is formed, being, in short, a hollow cylinder (see Fig. 2), with slits or notches cut into its bottom edge, corresponding in number with the sliders which protrude to the mouth of the keyhole; the said slits or notches at their upper points being intended respectively to touch the tops of the sliders; and each slit or notch being cut precisely to that depth, that, all moving forward at once, each shall press the slider to which it respectively belongs exactly to that point in the barrel which will bring its notch over the steel plate above described. In short, the key, by means of its notches nicely adjusted to the requirements of the sliders, by one motion down the barrel, brings them all with their notches exactly opposite the otherwise obstructing plate; and then, on turning the key, the lock is opened. If only one of the notches in the key were inaccurate in a hair's breadth, the slider upon which it works could not be brought exactly to the right point, and the obstruction offered to it by the steel plate would prevent its moving, and with it all the rest, and so prevent the turning of the key. We should here state, that, besides the real notches in the sliders, Messrs. Bramah have of late years adopted the plan of adding "false notches," more or less numerous, which, although not deep enough to admit passage over the steel plate, are sufficiently deep to deceive or puzzle an experimentalist upon it. (These false notches are shown shaded in Fig. 1, and the false shoulders against which they play, shaded in Fig. 3.) Of these "false notches," there were several in the lock operated upon by Mr. Hobbs.



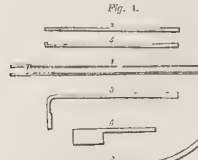
The key being removed from the lock, all the sliders are forced back to their original places at the top of the barrel, by means of a spiral wire acting upon a circular disc, or thin piston, upon which the inner edges of the sliders are made to rest for that very purpose.

We now come to describe the principle upon which Mr. Hobbs worked in picking this lock; the instruments which he used being represented in the fourth Engraving. The first point to be attained was to free the sliders from the pressure of the spiral spring (a pressure in the case of some thirty or forty pounds, so that they might be worked up and down in their respective grooves, until by nice observation the exact situation of the notch in each should be ascertained and they all be brought opposite the steel transverse plate. For this purpose the steel rod (E, fig. No. 3), being drilled at one end, and having two long projecting teeth, was used; the teeth being introduced between the heads of the slider, and made to press upon the disc, supported by the spiral spring, which was then driven back by it. In order to secure it in this position, and to relieve the hands of the operator free, the curved stanchion (No. 2) [illegible]; already screwed into the side of the door, was used; the screw at the end being applied to the top of the drilled cylinder in question.

[illegible] the business of "feeling the teeth" or notches of the sliders, [illegible] for which purpose [illegible] part of [illegible] each [illegible] and [illegible] [illegible]

in the slider, the latter for drawing it back, should it have gone in too far. As soon as the exact bearing of a slider was ascertained, it was recorded for future reference by means of a thin and narrow plate of brass (No. 6) introduced, and marked exactly at the length required; so that, although every time the operator left the lock he left it precisely in its usual normal state, and to all intents and purposes as if nothing had been done to it, he carried the results of his day's progress away with him, and began on each succeeding day from the point where he left off the day before.

Fig. 1.



IMPLEMENTS USED BY MR. HOBBS IN PICKING THE LOCK.

When we state that the lock which was the subject of the present operations contained no less than eighteen sliders, each of which had to be adjusted to its proper place, the reader will appreciate what we said, in our last article upon this subject, that picking such locks must sometimes be a matter of time. An eighteen-slider lock, according to Mr. Bramah's pamphlet (the second edition of which was published in 1815), "supposing the projecting surface of each slider to admit of only six different situations for the notch, presents a sum of security as compared with unity of 678,841,612,507,168,000." How many lives would it take to hit by chance upon the right key out of so many changes? Yet by the process of observation used by Mr. Hobbs, he steadily arrived at the bearings of this lock, and unlocked it after paying it ten visits, amounting in duration altogether to less than fifty hours! Indeed, we believe, he had actually picked the works of the lock in less than half those time; for, on his fifth visit, he had succeeded in adjusting the slides and turning the cylinder a quarter round (which he could not have done if any one of the sliders had "bit"), when the instrument used for turning it, being too slight, slipped, and defeated the operation. He had then to readjust the cylinder to its original place, having procured the small lever (No. 3), about six inches long, for the purpose; and on the day on which he did so (23rd August), after an hour and a half's operations, he opened the lock. The announcement of the result was delayed for a few days, in consequence of all the members of the committee (Dr. Black, Professor Cowper, and Mr. Rennie) not being in town to witness the fact of the opening of the lock. We understand that they all assembled for the purpose on Friday, the 29th; when, in their presence, and that of Mr Bramah, Mr. Bazalgette, and others of the establishment, Mr Hobbs unlocked and locked the lock several times, afterwards placing the lock uninjured in the hands of the proprietors

The following is the official report of the arbitrators in this case:—

REPORT of the ARBITRATORS to *whom the Bramah Lock contract etc.) has been referred*

Whereas for many years past a padlock has been exhibited in the window of Messrs. Bramah, in Piccadilly, to which was appended a label with these words: "The artist who can make an instrument that will pick or open this lock shall receive 200 guineas the moment it is produced." And Mr. Hobbs, of America, having obtained possession of Messrs Bramah to make trial of his skill in opening the said lock, Messrs Bramah and Mr. Hobbs severally agreed that George Rennie, Esq. F.R.S., of London, and Professor Cowper, of King's College, London, and Mr Basts, of Kentucky, should act as arbitrators between the said parties

That the trial should be conducted according to the rules laid down by the arbitrators, and the award of 200 guineas be decided by them on the day that they should say "Done" between the parties

On July 13, it was agreed that the lock should be enclosed in a block of wood, and screwed to a door, and the screws sealed, the key, hole and the loop only being accessible to Mr Hobbs; and, when he was not operating, the key-hole was to be covered with a band of iron and sealed by something than no other person should have access to the key-hole. The door was then sealed up, and was not to be used until Mr. Hobbs had finished his operations. If Mr. Hobbs succeeded in picking or opening the lock, the key was to be tried; and if it locked and unlocked the padlock, it should be considered as a proof that Mr Hobbs had not injured the lock but had fairly picked or opened it, and was entitled to the 200 guineas

On the same day (July 13) Messrs Bramah gave notice to Mr Hobbs that the lock was ready for his operations

On July 24 Mr Hobbs commenced his operations and on Aug 23 Mr Hobbs exhibited the lock opened to Dr Black and Professor Cowper Mr Rennie being at the time abroad. Dr Black and Professor Cowper then sealed the key-hole and door, and showed Mr Hobbs how to open it. Mr. Edward Bramah and Mr. Bazalgette and showed them the lock opened they then withdrew, and Mr. Hobbs locked and unlocked the padlock in two or five Black and Mr Cowper

Between July 24 and Aug 23 Mr Hobbs's operations were, at time, suspended; so that the number of days employed by Mr Hobbs was 16, and the number of hours he was engaged in the room with the lock was 50

On Friday, August 29, Mr. Hobbs again locked and unlocked the padlock, in presence of Mr G. Semane, Professor Cowper, Dr. Black, Mr Edward Bramah, Mr. Bazalgette, and Mr. Abraham

On Saturday, August 30 the key was tried and the padlock was locked and unlock with the k. by Professor Cowper, Mr. Rennie, and Mr. C. Bramah—thus proving that Mr. Hobbs had fairly picked the lock without injuring it. Mr. Hobbs then formally produced the instruments with which he had opened the lock

We are therefore of opinion that Messrs Bramah have given Mr Hobbs a fair opportunity of trying his skill, and that Mr Hobbs has fairly picked or opened the lock; and we award that Messrs. Bramah and Co do now pay to Mr. Hobbs the 200 guineas

GEORGE RENNIE, Chairman
JOHN LEE COWPER.
J. H. BLACK

Holland-street, Blackfriars, Sept. 2, 1851.

It appears, from certain letters which they have been writing to the papers, that Messrs. Chubb do not believe, and would have the public join in their unbelief, that their lock also has been fairly picked, has been stated in the ILLUSTRATED LONDON NEWS of the 2d August. Perhaps it will be sufficient, in answer to these epistolary productions, to print two simple documents which Mr Hobbs has sent to us, touching the matter in dispute.

(No. 1.)

To Messrs. Chubb, 57, Paul's Churchyard

Gentlemen—An attempt will be made to open a lock of your manufacture on the door of a strong-room, at 31, Great George-street, Westminster, to-morrow, Tuesday, at 11 o'clock A.M. You are respectfully invited to be present to witness the operation. I am, &c.,

Opening.

A. C. HOBBS

A Model in Department, Crystal Palace, July 2..

Messrs. Chubb took no notice of this communication

(No. 2.)

London, July 24, 1851.

We, the undersigned, do hereby certify, that we attended, with the permission of Mr. Hall, of No 31, Great George-street, Westminster, an invitation sent to us by A. C. Hobbs, of the city of New York, to witness an attempt to open a lock throwing three bolts and having six tumblers, affixed to the iron door of a strong-room or vault, built for the depository of valuable papers, and formerly occupied by the agents of the South-Eastern Railway that we severally witnessed the operation which Mr. Hobbs commenced at 7 minutes past 11 o'clock A.M., and opened the lock within 25 minutes Mr. Hobbs, having been requested to look it again with his instruments accomplished it in the short space of 7 minutes, without the slightest injury to the lock or door We minutely examined the lock and door (having previously had the assurance of Mr. Bell that the keys had never been accessible to Mr. Hobbs, he having had permission to examine the keyhole only). We found a plate at the back of the door with the following inscription "Chubb's new patent (No. 961, 961), St. Paul's Churchyard, London, maker to her Majesty."

Mr Hardley, 26, Great Earl-street Mr Will Ian N Marshall, 42 Charing-cross Mr W Armistead, 30 Bedford-street, Bloomsbury-park Mr R Porter, Park Cottage, Bayswater Mr W Wenham, Kilburn-villas, Kilburn Mr A Shanks, Robert-street, Adelphi Mr T Shanks, Robert-street, Adelphi Colonel W Clifton, Morley's Hotel Mr Kenyon Parkinson, 42 Southampton-buildings Mr Paul H Hodge, 8, Adam-street, Adelphi Mr Charles H Pudsey, 5 Norfolk-street, Strand

There is something, perhaps, in names; and it is remarkable that this is not the first time in our history that a Hobbs (or Hobbes) and a Lock (Locke) have been in antagonism. On the former occasion, it is understood the Royal Locke had the best of it—now the Republican Hobbs has his turn. Seriously speaking, the event is one extremely interesting to all, both in an artistic and utilitarian point of view, and will probably set our lock-makers bestirring themselves to devise some new method of security, based upon some more certain principles than the "doctrine of chances."

BARNET GREAT CATTLE FAIR.—The great annual gathering of breeders, graziers, speculators and jobbers in cattle, interested in this important cattle fair, which commenced on Thursday, ended, if possible, any former year. Every train to Barnet by the Great Northern Railway, on each day, brought such an influx of persons into the town, that sufficient sleeping accommodation could not be procured at any price. An immense number of cattle arrived in the early part of the week, and on all the pastures around Barnet were to be seen grazing many thousands of beasts from all the principal feeding counties throughout England. The beasts were in most excellent condition.

The election of a coroner for the eastern or upper division of the county of Gloucester took place at the Town Hall, on Tuesday, when Joseph Lovesrove, Esq., solicitor, of Gloucester, was elected without opposition. This has ended a contest which for the last few months has caused no inconsiderable excitement in the county.

On Monday notice was issued at the National Gallery, Trafalgar-square, that the room Cooper, Wallis through House, that they would be closed on Saturday, the 13th instant, for the annual cleaning. They were re-opened to the public on Monday, the 15th October.

THE GREAT EXHIBITION.

THERE has certainly been an increase in the attendance during the past week, and this appears to have arisen in a great degree from the excursion trains from the manufacturing districts of the north. On Monday, about a thousand people came up from Sunderland, headed by the mayor of that town, and Mr James Hartley, the glass manufacturer. This chiefly consisted of the members of a workman's association, formed as early as March, 1850, for the purpose which is now attained, and was probably one of the first of its kind, for its rules were used as a model by nearly all the others subsequently formed. By a singular fatality, no space had been claimed by these who intended to exhibit from this thriving sea-port, and consequently, at the very last moment, the contributions from Sunderland had to be placed in the American department; but more singular still is the fact, that amongst the contributions is a model of a pilot coble which, in its lines and construction is an exact counterpart of the American yacht which has created such a sensation by its fast sailing qualities; and this cobb is in every respect, except the false keel, a complete model of this "Yankee clipper" Sunderland is famous for building these pilot cobles, which are considered the fastest boats in any waters. The pilot boats at New York are built in the same manner, and are noted for the same qualities. They enter the water in the same manner as the *America*, presenting a concave, instead of the usual convex surface, and the breadth of beam is at precisely the same point between stem and stern. The Sunderland people, on understanding the build of the *America*, appear to have been so confident that she would beat all the yachts, that, had time permitted, they would have built a double-sized coble, and sent it down to the Isle of Wight to try its luck in the race, as the only thing likely to get near it when once fairly afloat.

A few additions have been recently made to the sculpture department; and, in the East India portico, a small but interesting consignment from Singapore and Malacca will be at once arranged. This arrived in this country so early as last February, but by some unaccountable delay or negligence on the part of the Oriental Steam-Packet Company's officials, it has only just reached the Building, and that too through the efforts of the Executive officers, to find out where the package was of which lists had been duly received, and a statement to whom it was sent. The contribution consists of gold dust, and various qualities of native gold; a golden "pending" for a girdle, and a sash ornament, beautifully chased and characteristically Eastern in design; two small diamonds enclosed in a quill, one being a "blue" specimen; together with a specimen of a material, the properties of which are unknown, named "Gutta Banga." It is not unlike gutta percha in its general character, but is of a much lighter and more agreeable colour.

A supplementary jury was empanelled the other day to adjudicate prizes amounting to 100 guineas presented by the Governor of Canada, Lord Elgin, as a proof of the estimation in which his Excellency holds the efforts of the Canadian exhibitors. The jury was composed of gentlemen resident in London, selected from the other juries for their knowledge of the various departments of which they were called upon to adjudicate.

There have been several experimental trials of machines and other contributions during the week. On Monday the relative merits of Porter's and Rogers' anchors were tested; and on Tuesday the two cumberlifting machines were worked against each other. Appleton's had an enormous advantage over the other. The anchor testing, however, did not lead to any final result, except that the ordinary navy anchor was proved to be inferior to either that of Lieutenant Rogers or Mr. Porter; and it is intended to invite the Admiralty to examine and decide upon the question, as if it is likely that "my Lords" will know anything at all about it when they see it.

ROYAL DISPENSARY FOR DISEASES OF THE EAR.—On Thursday, the half-yearly meeting of the governors of this useful charity was held at the dispensary, Dean-street, Soho; Mr. R. J. Cole presiding. The report stated that during the past six months the charity had been aided by the benevolence of her Majesty, his Majesty the King of the Belgians, the trustees of the Cholmondeley Charity, the Earls of Effingham and Darnley, Lord Leigh, and many other persons. The surgeon of the institution, Mr. Harvey, stated that 527 persons had been treated for disease of the ear for the past six months, and most of them successfully. The report was adopted, and votes of thanks given to Mr. Harvey, the committee, and the chairman

RAILWAY COMMUNICATION BETWEEN PIEDMONT AND SWITZERLAND. The *Patrie* at *Lausanne* states (says the *Corriere Mercantile* of the 29th ult.) that a company of Swiss, Italian, and English engineers have been studying the best means of opening a communication by rail, as short as possible, by the St. Gothard or the St. Bernard, and it seems that they have discovered a passage from the Valais to the Val d'Aosta, which will only require a tunnel of three kilometres.

The following are the imports of foreign grain, flour, &c., into Liverpool for the fortnight ending the 27th of August:—399,084 bushels wheat, 145,647 barrels and 3935 sacks flour, 116,260 bushels Indian corn, 9568 ditto barley, 23,049 ditto oats, 39,848 ditto beans, 12,294 ditto peas, 644 cheeses, 219 boxes and 100 cases ditto.

VICTORIA-STREET, WESTMINSTER.

On the 6th of August last was publicly opened one of the most important new streets that Government patronage or private enterprise has as yet succeeded in carrying out in London. The street to which we allude has been silently but unceasingly in progress for the last nine years. It lies in a part of London particularly in want of improvement, runs through a district connecting the modern Belgravia with the new Houses of Parliament. This street, most properly called Victoria-street, owes its origin to the zeal and activity of Sir Edwin Pearson and his fellow Commissioners for effecting the improvement of Westminster, under the skilful architect of the Commission, Mr. Henry Ashton, whose name will be honourably connected with that of Sir Jeffry Wyatville, as long as even a single gateway remains of Windsor Castle.

The great improvements in the formation of leading thoroughfares in London, in modern times, have been the formation of Regent-street, the erection of New London-bridge, and its approaches, the connecting Piccadilly and Coventry-street with Leicester-square and Long-acre, the formation of New Oxford-street, and the street now in progress leading from London-bridge to St. Paul's. But, with the exception of Regent-street, none of these can fairly be classed in the broad range of permanent utility with the new street in Westminster. New Oxford-street is chiefly a road and shop frontage improvement. Cannon-street, in the City, will be much the same; but Victoria-street comprehends a wider range of public utility than a direct means of approach between Belgravia and the Houses of Parliament, including, as it does (thanks to the benevolent forethought of Sir Edwin Pearson), a thorough improvement of the worst part of Westminster.

Victoria-street should be seen to be understood, for it is at present (see our accompanying Illustration) one of the sights of London. Long resident in Westminster ourselves, and by no means narrow or careless observers of its streets and alleys, the surprise of pleasure which we felt in our first solitary survey of the new street was something wonderful. The necessity for such a thoroughfare, about which we had no kind of doubt before, was obvious at a glance. The old localities which it threw open to us appeared in a new and improving shape. Elliot's brewer, long a secluded sight in Pimlico, is now open to all, and in a crowded thoroughfare; the Bridewell will now become as well-known a London exterior as Newgate or the Penitentiary; thousands will find out the once solitary churchyard in which "Blood, who stole the crown," lies buried; and tens of thousands will find out Miss Burdett Coutts' beautiful church, built in the densest purlieus of Westminster; others will observe, for the first time, some of the little known but useful charities of this part of London; while all will unite in admiring the beautiful combination of architectural arrangement at the east end of the street, where the towers of Westminster Abbey, and of the New Houses of Parliament are seen in harmonious grouping together. Mr. Barry, indeed, may, from this new point of sight, learn something of importance for his new Houses of Parliament, while the propriety of Jeremy Benthum's remark, that, "if a place could exist of which it could be said that it was in no neighbourhood, it would be Tothill-fields," must be understood to apply altogether to the past.

The area of the district immediately influenced by the operations of the Commissioners is about four hundred acres, containing probably, between three and four thousand houses; and the first labour of the Commissioners, after clearing away the houses for the line of street, was the construction of deep and efficient drainage for the surrounding houses. This was especially requisite, as the district over which the operations of the Commissioners extend is formed by deposits from the Thames, and certain small rivulets (of which some of the springs remain), formerly surrounding Thorney Island. This low-lying district is at times considerably below the level of high water in the Thames; so that the drainage throughout an extensive portion was, till the new street was formed, merely on the surface.

The labours of the Commissioners comprise not only the formation of Victoria street—above one thousand yards, or nearly five furlongs, in length, and eighty feet wide throughout—but the formation of six other streets, with excellent arrangements for the abundant supply of clean water, and lines of sewers nearly two miles in length, of which the tubular side drains already laid exceed, we are told, three miles. These new streets—of which the principal is Albert-street, connecting Victoria-street with the Birdcage-walk and Buckingham Palace—will be raised above the present level of the surface as much as seven feet, and in all cases so as to be within the reach of efficient drainage. Nor has less attention (and that of the best kind) been paid by the Commissioners and Mr. Ashton to the vaults under the line of the pavements on the sides of the streets, using, as they have done, in all cases, the best and hardest bricks, to carry out a novel line of vaulting, by gathering over the spaces between the back lines of the vaults into one unbroken line of solid support for the curb.

The Act of Parliament for the formation of this street was passed in 1845. Under this act, the Commissioners, the Government, and the parishes undertook jointly to furnish money to the amount of £150,000, no part of which was to be repaid until all the improvements were completed, the estimate having been framed on the supposition, that, on the security of the property purchased with this sum, further moneys could be raised sufficient to carry out all the purposes in view. The total cost, up to the present time, of forming the street, and turning the area thereof, with part of the adjoining frontages, amounts to about £250,000; and it is estimated that a further expenditure of £100,000 will give the Commissioners possession of frontages in Victoria-street and back lands of the annual value of £16,000. The value of this property, at the lowest price usually obtained for ground-rents, is valued by the agents of the Commissioners at £400,000.

Among other plans, the Commissioners propose to devote a considerable portion of the district to the erection of houses on the Scotch principle, for accommodating two families on each floor, in separate sets or "flats" of apartments, affording the same privacy as if each dwelling were entirely distinct. One of these houses, built by Mr. Mackenzie, the contractor for the works, is nearly completed, and is shown as a specimen of what the rest will be, though it is contemplated that some will be on a much larger, and others on a smaller scale. The rents of the apartments in this building are to vary from £50 to £60 a year, including rates and taxes, water and gas, and affording the accommodation of two sitting-rooms, four bed rooms, with scullery, kitchen, and other conveniences.

Another important point which has attracted the attention of the Commissioners is the duty of providing better houses for the working men who have necessarily been turned from their former abodes by the recent improvements, taking a lesson in this respect from the evil occasioned in St. Giles's, when New Oxford-street was forming. As a sample of what may be done, and in the hope of showing the capitalist how to advantageously invest in lodging-houses, the Commissioners have issued a circular, showing that, for the sum of £2000, they can arrange with bodies for the erection of a model lodging-house capable of accommodating not less than 50 persons at rents of 3s. a week each, which, after payment of a certain rent to the builder, and all other expenses, will leave a return, it is calculated, of 10 per cent. per annum on the £2000. The Commissioners will undertake to subscribe the sum to be raised as a loan for the building, having a frontage of 140 feet, and a depth of 100 feet, and to undertake all the responsibility of the arrangement. The accommodation proposed to be afforded is for the rent of 4s. a week in two good rooms, a water-closet, and a scullery for each family. It is in contemplation, also, to erect sets of apartments containing three rooms at 5s. a week, and others containing four rooms at 6s., so as to meet the requirements of larger families.

The Commissioners will not have completed their arduous and important undertaking without effecting a further improvement in the approaches to their new street. At present it is understood they are directing their attention more immediately to the Westminster Abbey end of Victoria-street; and the plan they have in view is, the removal of the railed-in plot of ground where Canning's statue stands, so as to carry on the main line of street to the new Westminster Bridge, to be erected a little lower down the Thames than the present bridge. On the site of part of the railed-in ground their propose erecting a statue of Queen Victoria, in bronze, by Mr. Bell, and have offered to find a site for the contemplated statue of Caxton. A still better suggestion, and one much in favour with the Commissioners, includes an avenue of statues of the great Parliamentary statesmen, Pitt, Fox, Canning, Peel, &c., leading from Victoria street to Westminster-bridge and the Houses of Parliament. This plan has much to recommend it, and the Government, we trust, will not allow any false economy to interfere with its completion.

It would be unjust to conclude a notice of this kind without mentioning the name of Mr. Mackenzie, the able and energetic contractor of the works, who has, in all respects, carried out the views of the Commissioners and their architect.

of the discovery of the treasures of California; and the islands of the Pacific, and that splendid continent of Australia itself, seem as if they were about to be indebted to the same cause for an immense accession of the strength which springs from the presence of active, enterprising men. The Northern and Eastern hemispheres have hitherto had all the glory and power of civilisation. The "world," till within a hundred years, or even less, was supposed to lie within those boundaries. All beyond was undeveloped. But the West and the South are now starting into rivalry with them. The one is confronting the old, and claiming its full space in the world, and its full share in the fortunes of humanity. It would certainly be a strange result, if gold—after having served its uses in attracting to the remotest and hitherto unpeopled regions of the globe the too crowded swarms of the earlier settled countries of Europe and Asia—should ultimately be discovered to be so plentiful as to be no longer the most precious of metals. Yet even this result, though extraordinary, does not seem at all unlikely in the extraordinary times in which we live. But what if we should have been hoaxed in this matter? The next arrival from Australia will enable us to form an opinion. In the meantime, we can but wonder—and wait.

STATUE OF HER MAJESTY AT EDINBURGH.

THIS graceful statue of the Queen was placed upon its pedestal in front of Holyrood Palace (about 100 *ft.* in advance of the main entrance) on the 22d ult., "in commemoration of her Majesty having occupied that ancient edifice as a residence in 1850."

The statue is the production of Mr. Handyside Ritchie. Her Majesty wears a tiara, and a regal robe embroidered round the collar with the trefoil ornament, and entirely surrounded by a thistle *bordure*. The folds of the drapery are disposed so as to show the entire figure; and the back view, difficult in such heavy draping, is well managed. Her Majesty's left hand is pressed to her breast, and in her right hand she bears a palm branch, emblematic of her peaceful reign. Her countenance is marked with simplicity and dignity, and the profile of the entire features and figure is seen with queenly effect on entering the Palace-yard, to the north of the statue.

The pedestal is picturesquely ornamented. It is ogival in form, and is richly ornamented with foliage and wreaths of fruit and flowers—the four sides being paneled, and having infantile figures in alto-relievo personating the Seasons. Spring is scattering rose-buds, and is surmounted with a wreath of snow-drops, primroses, violets, &c. Summer is laden with roses, and has her accompanying wreath of sunflowers, &c. Autumn, with his horn of plenty, rejoices amid golden grain and ripe fruits. And Winter, with his dried faggot and withered leaf, is merry amid mistletoe, holly, ivy, palm, and laurel. The whole of the detail in the pedestal is admirably designed and exquisitely chiseled; and the ornamentation of the pedestal, instead of detracting from, enhances the value of the statue by contrast, investing it with additional repose and simplicity.

The figure is colossal, being 9½ feet high, and, with the pedestal and sub-plinth, measuring 20 feet in height. Upon the latter is inscribed:—

EDINBURGH
Commemorates the occupation by
QUEEN VICTORIA
Of her Ancestral Palace of
HOLYROOD.
29 August, 1850.

The stone is from the liver rock of Redhall Quarry; and its light, warm tint contrasts well with the cold grey tone of the surrounding buildings.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The question of the candidateship of the Prince de Joinville for the Presidency of the Republic, which has hitherto come before the public only in vague rumours, has at length assumed form and consistency, in consequence of the result of an interview between M. Guizot and the members of the Orleans family, at Claremont, last week, on the subject, having been published in the journals.

M. Guizot and the partisans of the late ex-King are opposed to the Prince presenting himself for election to the Presidency, on the ground of its being an act of alliance with the Revolution, and the Orleans princes, generally, are also opposed to, and inconsistent with, the principles on which was founded the Monarchy of July.

The Duc de Nemours, who was the spokesman of the ex-Royal family at the interview, when pressed by M. Guizot for a definite explanation of the family policy or intention in the matter, would give no explicit avowal of either; but left it to be understood that they neither solicited nor rejected the offer of support which might be or had been made to M. de Joinville, as a candidate for the Presidency; so that they might advance or back out of the position in which they found themselves at the near approach of the contest, according as they might deem fitting and necessary.

In fact, vacillating expediency, without any particular regard for the dignity of their attitude or the consistency of their principles as Royalists, proved prominently forth as the course which the present representatives of the House of Orleans had marked out for their adoption at the approaching momentous crisis in the political history of their country. Nothing bold, original, or able, was shown as the result of the family councils but a characteristic lust of power, recklessness of purpose, and readiness to resort to any unprincipled petty-fogging cunning means of success which chance medley may offer. Whilst the Prince de Joinville and his family continue in this undecided attitude, the Paris journals discuss the question with much earnestness. The *Journal des Débats* has pronounced in favour of the Prince's claims, and in opposition to the candidateship of Louis Napoleon, which it says is unconstitutional, and must be repelled. Considerable importance is attached to the crisis in question, as it is supposed to have been written with the consent of the Orleans family, whose organ the *Débats* is acknowledged to be. Louis Napoleon is fully aware of the hostility of the Assembly to his Government, and of the intrigues going on by various parties to prevent his re-election; but, relying upon the support of the people, he is resolved to do nothing rashly to increase the bitterness of his enemies, but will wait with firmness the decision of the country.

The propriety of the revision of the Constitution still engages the Provincial Councils, and out of 86 of those bodies, not less than 60 have declared in favour of that measure, while only five voted against it.

The Correctional Chamber of the Court of Appeal of Lyons for the trial of the political prisoners has at length concluded its labours. The questions examined by the court were:—1. Were the accused guilty of having taken part in a plot at Lyons for the purpose of changing or destroying the government of the Republic? 2. Was that plot followed by an act committed or commenced for preparing the execution of it? 3. Were the same accused guilty of having formed part of a secret society. As to Gent, there was no additional question. Was the accused guilty of having been the chief? The decision of the court on these questions was, that 14 of the accused were *not guilty*, and that the others, 36 in number (including those in flight, were *guilty*.

The sentences passed upon the [illegible] after were in virtue of articles 87, 89, and 91, of the Penal Code, 3 of the decree of 28th July, 1848, on secret societies, and said articles being modified with respect to some of the accused, by Article 463 of the Penal Code, and 2 of the Law of Germinal, an. 7. These modifications were as follows:—

Transportation—Alphonse Gent, Albert Ode, Longomazino, Du Eaist Prix Antoine Roy' Carapelle, and [illegible].

Ten years' detention—Monnet.

Seven years' detention—M. Dobelcamp, Beuvier, Barbet, Daumas, Marsaton, Salatolle, Lenoir-Dufresne, and Morlon.

Five years' detention—Bard, Chevalier, Isaac Pinet, Jean Pinet, Richard, Blanchet, Pierre Mayenet.

Five years' imprisonment, [illegible] of privileges and 100 francs fine—Mayet, Jean Baptiste Bonnet, [illegible] Jouvenne, Perdicon.

A year's imprisonment, 100 fr fine, and two years' deprivation of civil rights—Daniel, Boudreau, Chapuis.

Six months' imprisonment and two years' deprivation of civil rights—Dupot, Carle.

Two years' imprisonment and 100 fr fine—These are the majority of many [illegible] sentences in what the French law calls *affaires de fournées*—that is, more recent than ordinary superficiaries, and subjects the offender, after his release, to the surveillance of the police for life.

Twenty-two of the prisoners have appealed against the decision of the correctional Court, and are to be tried by the Court of Appeals at Lyons, to explain and justify their conduct in throwing up their briefs at the late trial.

Paris also contributes its quota to the conspiracies against the Government, one of which has this week been discovered, in which the Red Republican exiles in London are also concerned; and sixty-five persons have been arrested, among whom is the late secretary to M. Ledru-Rollin.

The Mayor of Beaune has been suspended for three months for making a Socialist speech, which he distributing prizes at the college in that town.

On Monday, General de Lawestine reviewed in the Champ de Mars the cavalry of Paris, previously to their departure for the camp, after 46 years' service. The ceremony was very [illegible].

Marshal [illegible] Minister of Foreign Affairs, was seriously ill [illegible] ident of the Republic paid him a visit on Wednesday.

AUSTRIA.

A series of decrees, dated August 20, has been issued by the Emperor of Austria to the members of the Cabinet, on the subject of Ministerial responsibility, and on the necessity of considering the possibility of maintaining the Constitution of May 4, 1849, which are constructed as the first grand step backwards to absolute government.

The principal of these decrees are as follows:

MOST HIGH CABINET LETTER TO THE MINISTER PRESIDENT

Dear Prince—In reaching, as I do, the responsibility of its Cabinet as it now stands is devoid of legal distinctness and exactitude, my duties as a Monarch induce me to relieve Ministers from the doubtful position in which, as my counsellors, and as the highest executive organs they are now placed, by declaring that they are responsible to no other political power than the Throne.

1. The Cabinet has to swear in my hands unconditional fidelity, as also the engagement to fulfil all Imperial resolutions and ordinances.

2. The Cabinet will in future occupy a new position have punctually to carry out my resolutions concerning all laws, ordinances maxims of administration &c. Whether they have been considered necessary or judgment by Ministers, or whether the latter have been directed by me to come to and propose them

3. The Cabinet and each Minister in his department is responsible to me for the exact observance of the existing laws and Imperial ordinances in their administration. To each Minister is entrusted the direction of that branch of the administration with which he is charged 4. However, reserve in regard to the Cabinet in respect to most important decisions of the Court

1. The ministerial counter-signature is in future confined to the publication of laws and Imperial ordinances, and will be that of the Minister President, or that of those Ministers with whose branch the matter in question is connected. The Director of the Chancery of the Cabinet will sign such of the private formulæ of "By most high command," which will stand towards the side

These counter-signatures are as a warranty that the appointed forms have been observed, and that the Imperial ordinances have been punctually and exactly carried out

5. By the publication of laws and Imperial ordinances, the words "after having heard my Cabinet" will be subs tituted for "on the proposition of my Cabinet."

Schönbrunn, 20th August, 1851. FRANZ JOSEPH (M P)

MOST HIGH CABINET LETTER TO THE PRESIDENT OF THE REICHSRATH (COUNCIL OF THE EMPIRE)

Dear Baron Kubeck,—You will learn by the subjoined copy of my ordinance to the Cabinet the resolutions which I have taken relative to the responsibility and to the future position of my Cabinet. Those resolutions induce me to introduce some changes in the statutes of my Reichsrath

1. The Reichsrath is from this time forward to be considered as my Council and the Council of the Throne.

2. In consequence of this declaration, drafts of laws, ordinances, or other such matters have not to be presented by the Cabinet to the Reichsrath for its opinion, but always to me. Agreeably to par 7 of its statutes I reserve to myself the right of demanding the opinion of the Reichsrath, and of directing the discussion of matters under my own immediate direction, or that of its president

3. I reserve to myself the right of commanding the attendance of Ministers and their deputies at the councils of the Reichsrath, according to circumstances and necessity.

The alterations in the order of business and in other matters arising from the ordinances you have to lay before me without loss of time. If drafts of law, which have been forwarded by the Cabinet to the Reichsrath, are still under discussion, due notice is to be given to me; and, under all circumstances, the results of the deliberations of the council are to be laid before me.

Schönbrunn, Aug. 20, 1851. FRANZ JOSEPH (M P)

BELGIUM.

The Belgian ministry has been defeated in the Senate upon the law for the regulation of property. An appeal to the country is expected, as, from the present state of parties, a new Cabinet could not be formed.

SPAIN.

We learn from Seville, under date the 28th ult., that her Royal Highness the Duchess de Montpensier, sister of the Queen of Spain, was safely delivered of a princess on that day.

PORTUGAL.

We have advices from Portugal to the 29th ult. Saldanha's government was gradually acquiring a stability little contemplated when he first assumed the reins of power. Public credit was also gaining ground. A conspiracy had been formed by the Cabralites to effect a military revolution; but, before the day arrived when the plan was to be put into operation, Ministers were apprised of the whole plot, and by their energetic measures it was soon suppressed. A charge had been made against M. Ferrao, the Minister of Finance, of having some years since, while Procurador at Macedo, received a bribe from the tobacco contractors. M. Ferrao immediately begged her Majesty to accept his resignation, that he might vindicate his honour before a jury of his countrymen. This was acceded to by the Queen, but no portfolio has been placed ad interim in the hands of the Minister of Marine until the action shall have been tried, which there is every reason to believe will fully acquit him of the foul accusation, when he will resume the seals of office.

The yellow fever was raging at Oporto: it was conveyed there by a ship from the Brazils.

UNITED STATES.

We have accounts this week from New York to the 23d ult., and from Havannah to the 17th ult., wh ch are of considerable interest.

The Spanish war-steamer *Habanero* had captured four boat-loads of men, and 50 of them (Americans) had been publicly shot in the presence of 20,000 spectators. The Governor-General had sent 800 men to intercept Lopez, who had landed at Matanzas with 450 men

The excitement in the Southern States of the Union in reference to Cuban affairs was very great. Fears were entertained of disturbances in New Orleans, and the military were held in read ness to act. At New York a great mass meeting had been held, and the people had paraded the streets with banners bearing the inscription "The blood of 50 Americans cries for vengeance." The 50 men shot were a portion of the Lopez invaders which had become separated from the main body. Their names are published in the New York papers

From Washington we learn that the President and several of the leading members of the Cabinet were still absent, recruiting their health and energies for the approaching session. Governor Marcy, Secretary of War, and the Secretary of the Interior made speeches at their resept on at Stamton, in Virginia.

The question of the next Presidency continues to be much canvassed in political circles. All, however, are uncertain, and, on the Whig side, whether Webster or General Scott will be victorious, seems doubtful. Mr. Webster had set out on a tour round the White Mountains. His health has greatly improved since he left Washington.

The second session of the Baltimore Whig Convention was held on the 15th ult., at which resolutions were passed to make Whig nominations for every office for which there is the slightest chance of success.

The results of the recent elections in the Southern States do not seem to have had the effect of cooling down the ardour of that portion of the people of South Carolina who are favourable to a dissolution of the Union. They are more than ever in favour of secession.

Father Mathew had arrived at Erie, and assisted in the consecration of a new church in that place. At the close of the service, crowds of his countrymen flocked round the altar, to receive the pledge at his hands. A dinner was given in his honour in the evening.

We observe in the Boston papers, that the well-known novelist, Mr. G. P. R. James, was considerably injured by being thrown from his carriage while driving an unruly horse, at Stockbridge, Massachussets.

The cholera has broken out at Louisville, Ke tucky, in a very malignant form, and also in some of the towns on the Ohio river. The cause of its appearance is supposed to be the extensive heat of the weather, and continued heavy rains.

GOLD IN AUSTRALIA.

(To the Editor of the ILLUSTRATED LONDON NEWS.)

SIR,—It may interest your readers to learn something of the Bathurst district of New South Wales, the scene of the late discoveries, as the papers of this week, in connexion with the reported discovery of auriferous deposits.

Bathurst is both a town and a county of New South Wales, the former situated 114 miles distant from Sydney, the capital, in a W. N. W. direction. It is approached by the great western road, which, at 36 miles from the metropolis, after passing through the town of Penrith, and crossing the river Nepean—a remarkable, by Lapstone Hill, the elevated ranges demominated the Blue Mountains, and proceeding in a course nearly due west, reaches the beautiful Vale of Hassan's Walls (so named by Governor Darling, after the name of his native place in Scotland), and descending by the beautiful Pass of Mount Victoria into the smiling valley called the Vale of Clwyd. There it passes through the township, which bears the name of Hassan's Walls, and, from the resemblance the vast precipices bear to the ramparts of a fortress, which it remarked, is in high repute, but is less than one 1500 feet above the sea.

The Plains, or Vale of Clwyd, are undulating downs, fringed by the forest, and comprising a territory of some 30 miles in circumference; they are very fertile, and renowned for their excellent horses and sheep, their dairy produce, and wheat of first quality.

The country was located some thirty-five years since, and occupied by very respectable emigrant settlers, amongst whom the most extensive proprietor is Major-general Lawson.

The electoral district of Bathurst, returning one member to the Legislature, contains a population, by the census of March last, of 4932, and the town itself, 2289 persons.

The latter is a great emporium for the supply of all articles of consumption to the vast squatting districts that surround it, and requires only the advantage of railway communication with Sydney to go most rapidly ahead; and, with the copper mines in the district, to say nothing of the reputed gold, it will take a pre-eminent position amongst the towns of the interior. It already enjoys a local newspaper, and is a pleasant town for residence

The locality of Bathurst, where the gold and other minerals have been discovered, is to the south of the settlement, on Campbell's River, and from the annexed advertisement it will be perceived that the work is progressing, and hands are wanted:—

"Bathurst Copper-Mining Company.—Wanted, a competent person to act as Captain, or Agent at the Summer's Mine Campbell's River, near Bathurst. The minds as to capacity must be forwarded with the application for the situation to the undersigned. Miners are also required at the banana hill Mine.—KENNETT PEEL, Secretary."

Your obedient servant, W.

[Mr. [illegible] Bathurst gives two views of Bathurst, [illegible]

LOCKS AND LOCK-PICKING.

PICKING OF THE BRAMAH LOCK BY MR. A. C. HOBBS

IN our former articles on "Locks and Lock-picking," published in the ILLUSTRATED LONDON NEWS of the 2d and 9th August respectively, we described the process by which Mr. A. C. Hobbs, the American lock proprietor and lock-picker, had succeeded in picking a Chubb lock, in the presence of a committee of gentlemen, and how he had afterwards accepted the challenge to pick Mr. Bramah's lock—the same which has been hanging in his window in Piccadilly for the last twenty years—for a prize of 200 guineas. We also ventured an opinion that Mr. Hobbs would succeed in his undertaking, as he had in all previous ones of the kind; being convinced that no lock which depended for its security upon one system of combination parts—that is, not having any secondary or tertiary combination parts beyond the reach of the key-hole—could resist the attack made upon the principles upon which he acted. We have now to announce that what we anticipated has turned out to be the fact. Mr. Hobbs has picked the famous Bramah lock, and has done so upon a process so simple, as almost to be termed ludicrously simple, but that it is so unerring as to occasion feelings of anxiety to all who have treasures to keep under lock and key. It is always best to know the truth, however; and, therefore, as we did in the case of the Chubb lock, so now in the case of the Bramah, we shall endeavour to explain the whole process by which its supposed invulnerability has been disproved.

We will first describe the principle of the lock itself—that is, the combination parts, which constitute its supposed security; the leverage for throwing out and drawing back the bolt being upon the usual method.

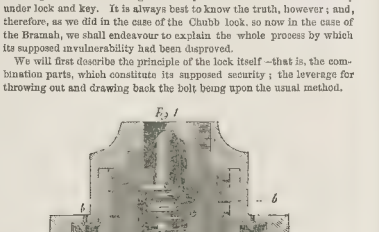

Fig. 1 represents the section of a circular block or barrel of brass, having a cylindrical cavity throughout, and divided from the centre into six or more compartments, separated by grooves passing also quite through its length. In each of these compartments a steel slider is fitted, somewhat of the shape marked No. 6, in Figure 4. These sliders, in connexion with a steel plate (d), running parallel to the horizontal section of the brass barrel, constitute the obstructive works against turning the barrel, unless with instruments adapted to adjust them respectively to their proper positions for that purpose. The upper parts of these sliders project into the cylindrical cavity, and are elevated to be flush with the prominence in the centre of the barrel, which is the keyhole (Fig. 2). The notch at the bottom of this prominent portion of the barrel is to receive the bit or lever of the key, for the purpose of turning it round.

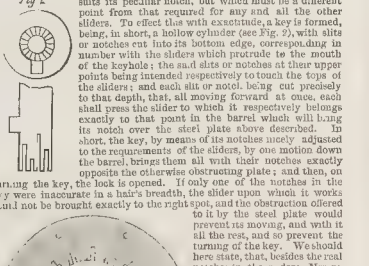
With respect to the sliders. They each play up and down the tube, through notches in the steel plate (shown more distinctly in Fig. 3), which, being firmly fixed in the barrel, would inevitably prevent the said sliders from moving round on the centre of the barrel as an axis, and therefore would prevent the key which operates upon them from turning, but for the following arrangement: In the outer edge of each slider is a notch of sufficient depth to let the projecting rim of the transverse steel plate freely pass through it (see the darker and deeper notches (b) in the sliders in Fig. 1). It must be obvious, that, if the notches in all the sliders were at the exact level of the steel plate at once, the whole system of sliders might be made to revolve round the centre of the barrel as an axis, and the lock be opened; and that, if these notches in the sliders were at the same relative point in each, the sliders would all have to be moved the same distance down or up the barrel to bring them to the playing point. But the case is not so. The notches are disposed irregularly on the several sliders, no two being alike in that respect; the consequence is, that the lock, each of the sliders must be brought to a point in the barrel which suits its peculiar notch, but which must be a different point from that required for any and all the other sliders. The effect this will constitute, a key is formed, being, in short, a hollow cylinder (see Fig. 2), with slits or notches cut into its bottom edge, correspond ing in number with the sliders which protrude to the mouth of the keyhole; the said slits or notches at their upper points being intended respectively to touch the tops of the sliders; and each slit or notch being cut precisely to that depth, that, all moving forward at once, each shall press the slider to which it respectively belongs exactly to that point in the barrel which will bring its notch over the steel plate above described. In short, the key, by means of its notches nicely adjusted to the requirements of the sliders, by one motion down the barrel, brings their notches exactly opposite the otherwise obstructing plate; and then, on turning the key, the lock is opened. If only one of the notches in the key were inaccurate in a hair's breadth, the slider upon which it works would not be brought exactly to the right spot, and the obstruction offered to it by the steel plate would prevent its moving, and with it all the rest, and so prevent the turning of the key. We should here state, that, besides the real notches in the sliders, Messrs. Bramah have of late years adopted the plan of adding "false notches," more or less numerous, which, although not deep enough to admit passing over the steel plate, are sufficiently deep to deceive or puzzle an experimentalist upon it. (These false notches are shown shaded in Fig. 1, and the false sliders are those against which they play shaded in Fig. 3.) Of these "false notches," there were



several in the lock operated upon by Mr. Hobbs.

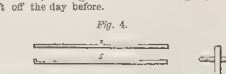
The key being removed from the lock, all the sliders are forced back to their original places at the top of the barrel, by means of a spiral wire acting upon a circular disc, or thin piston, upon which the inner edges of the sliders are made to rest for that very purpose.

We now come to describe the principle upon which Mr. Hobbs worked in picking this lock; the instruments which he used being represented in the fourth Engraving. The first point to be attained was to free the sliders from the pressure of the spiral spring (a pressure in this case of some thirty or forty pounds, so that they might be worked up and down in their respective grooves, until by careful observation the exact situation of the notch in each should be ascertained and they all be brought opposite the steel transverse plate. For this purpose the steel rod (Fig. 4, No. 1), being drilled at one end, and having two long projecting teeth, was used; the teeth being introduced between the heads of the sliders, and made to press upon the disc, supported by the spiral spring, which was then driven back by it. In order to secure it in this position, and to leave the hands of the operator free, the curved stanchion (No. 2) being already screwed into the side of the door, was used; the screw at the end being applied to the top of the drilled cylinder in question.

Then came the business of "feeling the teeth" or notches of the sliders, each respectively, for which purpose a plain needle and a sort of crochet needle (Nos. 3 and 5) were employed; the former for passing

in the slider, the latter for drawing it back, should it have gone in too far. As soon as the exact bearing of a slider was ascertained, it was recorded for future reference by means of a thin and narrow plate of brass (No. 6) introduced, and marked exactly at the length required; so that, although every time the operator left the lock he left it precisely in its usual normal state, and to all intents and purposes as if nothing had been done to it, he carried the results of his day's progress away with him, and began on each succeeding day from the point where he left off the day before.

Fig. 4.



IMPLEMENTS USED BY MR. HOBBS IN PICKING THE LOCK.

When we state that the lock which was the subject of the present operations contained no less than eighteen sliders, each of which had to be adjusted to its proper place, the reader will appreciate what we said, in our last article upon this subject, that picking such locks must sometimes be a matter of time. An eighteen-slide lock, according to Mr. Bramah's pamphlet (the second edition of which was published in 1615), "supposing the projecting surface of each slider to admit of only six different situations for the notch, presents a sum of security as compared with unity of 6*T*5,851,612,807,168,000." How many lives would it take to hit by chance upon the right key out of so many changes? Yet by the process of observation used by Mr. Hobbs, he steadily arrived at the bearings of this lock, and unlocked it after paying it ten visits, amounting in duration altogether to less than fifty hours! Indeed, we believe, he had actually picked the works of the lock in less than half that time; for, on his fifth visit, he had succeeded in adjusting the slides and turning the cylinder a quarter round (which he could not have done if any one of the sliders had "bit"), when the instrument used for turning it, being too slight, slipped, and defeated the operation. He had then to readjust the cylinder to its original place, having procured the notch-lever (No. 3), about six inches long, for the purpose; and on the day on which he did so (23rd August), after an hour and a half's operations, he opened the lock. The announcement of the result was delayed for a few days, in consequence of all the members of the committee (Dr. Black, Professor Cowper, and Mr. Rennie) not being in town to witness the fact of the opening of the lock. We understand that they all assembled for the purpose on Friday, the 29th; when, in their presence, and that of Mr. Bramah, Mr. Bazalgette, and other of the establishment, Mr. Hobbs unlocked and locked the lock several times; afterwards placing the lock uninjured in the hands of the proprietors.

The following is the official report of the arbitrators in this case:—

REPORT *of the* ARBITRATORS *to whom the Bramah Lock controversy has been referred.*

Whereas for many years past a padlock has been exhibited in the window of Messrs. Bramah's shop, in Piccadilly, to which was appended a label with these words: "The artist who can make an instrument that will pick or open this lock shall receive 200 guineas the moment it is produced." And Mr. Hobbs, of America, having obtained permission of Messrs Bramah to make trial of his skill in opening the said lock, Messrs Bramah and Mr. Hobbs severally agreed that George Rennie, Esq., F.R.S., of London, and Professor Cowper, of King's College, London; and Dr. Black, of Kentucky, should act as arbitrators between the said parties

That the trial should be conducted according to the rules laid down by the arbitrators, and the award of 200 guineas be decided by them—be fine, that they should not "play" between the parties

On July 13, it was agreed that the lock should be enclosed in a block of wood, and screwed to a door, and screws sealed, the key-hole and the hasp only being accessible to Mr. Hobbs; and, when no one was operating, the key-hole was to be covered with a band of iron and sealed by Mr. Bramah that no other person should have access to the key-hole. The door was also sealed on, and was not to be used until Mr. Hobbs had finished the operation. Mr. Hobbs undertook to pick or open the lock, the key was to be tried; and if it locked and the locked the padlock it should be so sidered as a proof that Mr. Hobbs had not injured the lock, but had fairly picked or opened it, and was entitled to the 200 guineas.

On the same day (July 13) Messrs. Bramah gave notice to Mr. Hobbs that the lock was ready for operation

On July 24 Mr. Hobbs commenced his operations and on Aug. 25 Mr. Hobbs exhibited the lock opened to Dr. Black and Professor Cowper. Mr. Rennie being out of town. The B. s. Aug. 27, when the lock in Mr. Edward Bramah and Mr. Bazalgette's presence showed them the lock opened (by the withdrew, and Mr. Hobbs locked and unlocked the padlock in presence of Dr. Black and Mr. Cowper

Between July 24 and Aug. 23 Mr. Hobbs's operations were, for a time, suspended; so that the number of days occupied by Mr. Hobbs was 15, and the number of hours he was engaged in the room with the lock was 51

On Friday, August 29, Mr. Hobbs again locked and unlocked the padlock, in presence of Mr. G. Rennie, Professor Cowper, Dr. Black, Mr. Edward Bramah, Mr. Bazalgette, and Mr. Abraham

On Saturday, August 30 the key was tried and the padlock was locked and unlocked with the key by Professor Cowper, Mr. Rennie, and Mr. Gibertson—thus proving that Mr. Hobbs had fairly picked or opened the lock; and by Mr. Hobbs thus formally performing the instruments with which he had opened the lock

We are, therefore unanimously of opinion that Messrs. Bramah have given Mr. Hobbs a fair opportunity of trying his skill, and that Mr. Hobbs has fairly picked or opened the lock; and we award that Messrs. Bramah and Co. do now pay to Mr. Hobbs the 200 guineas

GEORGE RENNIE, Chairman.
EDWARD COWPER
J. H. BLACK.

Holland street, Blackfriars, Sept. 2, 1851.

It appears, from certain letters which they have been writing to the papers, that Messrs. Chubb (!) not believe, and would have the public join in their unbelief, that their lock also has been fairly picked, as we stated in the ILLUSTRATED LONDON NEWS of the 2d August. Perhaps it will be sufficient, in answer to these epistolary productions, to print two simple documents which Mr. Hobbs has sent to us, touching the matter in dispute.—

(No. 1.)

To Messrs. Chubb, St. Paul's Churchyard.

Gentlemen.—An attempt will be made to open a lock of your manufacture on the door of a strong-room, at 34, Great George-street, Westminster, to-morrow, Tuesday, at 11 o'clock A.M. You are respectfully invited to be present to witness the operation. Yours, respectfully,

A. C. HOBBS

American Department, Crystal Palace, July 31.

Messrs. Chubb took no notice of this communication

(No 2)

London, July 22, 1851.

We, the undersigned, hereby certify, that we attended, with the permission of Mr. Bell, of No. 34 Great George-street, Westminster, at an invitation sent to us by A. C. Hobbs, of the city of New York, to witness an attempt to open a lock throwing three bolts, and having six tumblers affixed to the iron door of a strong-room or vault, built for the depository of valuable papers, and formerly occupied by the agents of the South-Eastern Railway; that we severally witnessed the operation which Mr. Hobbs commenced at 3 minutes past 11 o'clock A.M., and opened the lock within 25 minutes. Mr Hobbs, having been requested to lock it again with his instruments, succeeded in it in the short space of 7 minutes, without the slightest injury to the lock or door. We minutely examined the lock and door (having previously had the assurance of Mr. Bell that the keys had never been entrusted to Mr Hobbs, he having had permission to examine the keyhole only). We found a plate at the back of the door with the following inscription:—"Chubb's new patent (No. 561, 61), St. Paul's Churchyard, London, maker to her Majesty."

Mr Hardley, 26, Great Earl-street. Mr William N Marshall, 42 Charing-cross. Mr W Arnaud, 5, 35 the Harvilles, Barnsbury-park. Mr G S Perry, Putney-heath. Mr P Williams, Elfra-vale-lodge, Brixton. Mr A Shanks, Robert-street, Adelphi. Mr T Shanks, Robert street, Adelphi. Colonel W Colton, Morley's Hotel. Mr Edish Gallowat 42, Southampton-buildings. Mr Paul R Hodge, 9, Adam-street, Adelphi. Mr Charles H Peabody 4, Norfolk-street, Strand.

There is something, perhaps, in names; and it is remarkable that this is not the first time in our history that a Hobbs (or Hobbes) and a Lock (Locke) have been in antagonism. On the former occasion, it is understood the Royal Locke had the best of it now the Republican Hobbs has his turn. Seriously speaking, the event is one extremely interesting to all, both in an artistic and utilitarian point of view, and will probably set our lock-makers bestirring themselves to devise some new method of security, based upon some more certain principles than the "doctrine of chances."

BARNET GREAT CATTLE FAIR.—The great annual gathering of breeders, graziers, speculators and jobbers in cattle, interested in this important cattle fair, which commenced on Thursday, exceeded, if possible, any former year. Every train to Barnet by the Great Northern Railway, on Wednesday, brought such an influx of persons into the town, that sufficient sleeping accommodation could not be procured at any price. An immense number of cattle arrived in the early part of the week, and on all the pastures in and for miles around Barnet were to be seen grazing many thousands of beasts from all the principal breeding counties throughout England. The beasts were in most excellent condition.

The election of a coroner for the eastern or upper division of the county of Gloucester took place at the Town Hall, on Tuesday, when Joseph Lawrence, Esq., solicitor, of Gloucester, was elected without opposition. This gentleman succeeds Mr. Baker, who has held the office for the last two months, and has made considerable excitement in the county.

On Monday notice was issued at the National Gallery, Trafalgar-square, and at the Vernon Collection, Marlborough House, that they would be closed to the public on Saturday, the 13th inst., for the annual vacation. They will be re-opened to the public on Monday, the 27th of October.

THE GREAT EXHIBITION.

THERE has certainly been an increase in the attendance during the past week, and this appears to have arisen in a great degree from the excursion trains from the manufacturing districts of the north. On Monday, about a thousand people came up from Sunderland, headed by the mayor of that town, and Mr James Hartley, the glass manufacturer. This chiefly consisted of the members of a workman's association, formed as early as March, 1850, for the purpose which is now attained, and was probably one of the first of its kind, for its rules were used as a model by nearly all the others subsequently formed. By a singular fatality, no space had been claimed by these who intended to exhibit from this thriving sea-port, and consequently, at the very last moment, the contributions from Sunderland had to be placed in the American department; but more singular still is the fact, that amongst the contributions is a model of a pilot coble, which, in its lines and construction is an exact counterpart of the American yacht which has created such a sensation by its fast sailing qualities; and this coble is in every respect, except the false keel, a complete model of this "Yankee clipper." Sunderland is famous for building these pilot cobles, which are considered the fastest boats in any waters. The pilot boats at New York are built in the same manner, and are noted for the same qualities. They enter the water in the same manner as the *America*, presenting a concave, instead of the usual convex surface, and the breadth of beam is at precisely the same point between stem and stern. The Sunderland people, on understanding the build of the *America*, appear to have been so confident that she would beat all the yachts, that, had time permitted, they would have built a double-sized coble, and sent it down to the Isle of Wight to try its luck in the race, as the only thing likely to get near it when once fairly afloat.

A few additions have been recently made to the sculpture department; and, in the East India portion, a small but interesting consignment from Singapore and Malacca will be at once arranged. This arrived in this country so early as last February, but by some unaccountable delay or negligence on the part of the Oriental Steam-Packet Company's officials, it has only just reached the Building, and that too through the efforts of the Executive officers, to find out where the package was of which lists had been duly received, and a statement as to whom it was sent. The contribution consists of gold dust, and various qualities of native gold; a golden "pending" for a girdle, and a sash ornament, beautifully chased and characteristically Eastern in design; two small diamonds enclosed in a quill, one being a "blue" specimen; together with a specimen of a material, the properties of which are unknown, named "Gutta Binga." It is not unlike gutta percha in its general character, but is of a much lighter and more agreeable colour

A supplementary jury was empanelled to-day to adjudicate prizes amounting to 100 guineas, presented by the Governor of Canada, Lord Elgin, as a proof of the estimation in which his Excellency holds the efforts of the Canadian exhibitors. The jury was composed of gentlemen resident in London, selected from the other juries for their knowledge of the various departments of which they were called upon to adjudicate.

There have been several experimental trials of machines and other contributions during the week. On Monday the relative merits of Porter's and Rogers' anchors were tested; and on Tuesday the two centrifugal pumps were tried against each other. Appleton's had an enormous advantage over the other. The anchor testing, however, did not lead to any final result, except that the ordinary navy anchor was proved to be inferior to either that of Lieutenant Rogers or Mr. Porter; and it is intended to invite the Admiralty to examine and decide upon the question, as if it is likely that "my Lords" will know anything at all about it when they see it.

ROYAL DISPENSARY FOR DISEASES OF THE EAR.—On Thursday, the half-yearly meeting of the governors of this useful charity was held at the dispensary, Dean-street, Soho; Mr. R. J. Cole presiding. The report stated that during the past six months the charity had been aided by the benevolence of her Majesty, his Majesty the King of the Belgians, the trustees of the Cholmondeley Charity, the Earls of Effingham and Dunsley, Lord Leigh, and many other persons. The surgeon of the institution, Mr. Harvey, stated that 527 persons had been treated for disease of the ear for the past six months, and most of them successfully. The report was adopted, and votes of thanks given to Mr. Harvey, the committee, and the chairman.

RAILWAY COMMUNICATION BETWEEN PIEDMONT AND SWITZERLAND.—The *Patriote Bernois* states (says the *Corriere Mercantile* of the 29th ult.) that a company of Swiss, Italian, and English engineers have been studying the best means of opening a communication by rail, as short as possible, by the St. Gothard or the St. Bernard. It seems that they have discovered a passage from the Valais to the Val d'Aosta, which will only require a tunnel of three kilometres.

The following are the imports of foreign grain, flour, &c., into Liverpool for the fortnight ending the 27th of August:—399,384 bushels wheat, 148,647 barrels and 3935 sacks flour, 116,250 bushels Indian corn, 9568 ditto barley, 23,049 ditto oats, 39,448 ditto beans, 12,224 ditto peas, 644 cheeses, 219 boxes and 100 cases ditto.

VICTORIA STREET, WESTMINSTER.

On the 6th of August last was publicly opened one of the most important new streets that Government patronage or private enterprise has as yet succeeded in carrying out in London. The street to which we allude has been silently but unceasingly in progress for the last nine years. It lies in a part of London particularly in want of improvement. It runs through a district connecting the western Belgravia with the new Houses of Parliament. This street, most properly called Victoria-street, owes its origin to the zeal and activity of Sir Edwin Pearson and his fellow Commissioners for effecting the improvement of Westminster, and to the skill and energy of the Commissioners, Mr. Hemet Ashton, whose name will be honourably connected with that of Sir Jeffry Wyatville, as long as even a single gateway remains of Windsor Castle.

The great improvements in the formation of leading thoroughfares in London, in modern times, have been the formation of Regent-street, the erection of New London-bridge, and its approaches, the connecting Piccadilly and Coventry-street with Leicester-square and Long-acre, the formation of New Oxford-street, and the street now in progress leading from London-bridge to St. Paul's. But, with the single exception of Regent-street, none of these can fairly be classed in the broad range of permanent utility with the new street in Westminster. New Oxford-street is chiefly a road and shop frontage improvement. Cannon-street, in the City, will be much the same; but Victoria-street comprehends a wider range of public utility than a direct means of approach between Belgravia and the Houses of Parliament, including, as it does (thanks to the benevolent forethought of Sir Edwin Pearson), a thorough improvement of the worst part of Westminster.

Victoria-street should be seen to be understood, for it is at present (see our accompanying Illustration) one of the sights of London. Long resident in Westminster ourselves, and by no means narrow or careless observers of its streets and alleys, the surprise of pleasure which we felt in our first solitary survey of the new street was something wonderful. The necessity for such a thoroughfare, about which we had no kind of doubt before, was obvious at a glance. The old localities which it threw open to us appeared in a new and improving shape. Elliot's brewer, long a secluded sight in Pimlico, is now open to all, and in a crowded thoroughfare; the Bridewell will now become as well-known a London ornament as Newgate or the Lauretary; thousands will find out the once solitary churchyard in which "Blood, who stole the crown," lies buried; and tens of thousands will find our Miss Burdett Coutts' beautiful church, built in the densest purlieus of Westminster; others will observe, for the first time, some of the little known but useful charities of this part of London; while all will unite in admiring the beautiful combination of architectural arrangement at the east end of the street, where the towers of Westminster Abbey, and of the New Houses of Parliament are seen in harmonious grouping together. Mr. Barry, indeed, may, from this new point of sight, learn something of importance for his new Houses of Parliament, while the propriety of Jeremy Bentham's remark, that, "if a place could exist of which it could be said that it was in no neighbourhood, it would be Pobhill-a," must be understood to apply altogether to the past.

The area of the district immediately influenced by the operations of the Commissioners is about four hundred acres, containing probably, between three and four thousand houses; and the first labour of the Commissioners, after clearing away the houses for the line of street, was the construction of deep and efficient drainage for the surrounding houses. This was especially requisite, as the district over which the operations of the Commissioners extend is formed by deposits from the Thames, and certain small rivulets (of which some of the springs remain), formerly surrounding Thorney Island. This low-lying district is at times considerably below the level of high water in the Thames; so that the drainage throughout an extensive portion was, till the new street was formed, merely on the surface.

The labours of the Commissioners comprise not only the formation of Victoria street—above one thousand yards, or nearly five furlongs, in length, and eighty feet wide throughout—but the formation of six other streets, with excellent arrangements for the abundant supply of clean water, and lines of sewers nearly two miles in length, of which the tubular side drains already laid exceed, we are told, three miles. These new streets—of which the principal is All-art-street, connecting Victoria street with the Birdcage-walk and Buckingham Palace—will be raised above the present level of the surface as much as seven feet, and in all cases so as to be within the reach of efficient drainage. Nor has less attention (and that of the best kind) been paid by the Commissioners and Mr. Ashton to the vaults under the line of the pavements on the sides of the streets, using, as they have done, in all cases, the best and hardest bricks, to carry out a novel line of vaulting, by gathering over the spaces between the back lines of the vaults into one unbroken line of solid support for the curb.

The Act of Parliament for the formation of this street was passed in 1845. Under this act, the Commissioners, the Government, and the parishes undertook jointly to furnish money to the amount of £150,000, no part of which was to be repaid until all the improvements were completed, the estimate having been framed on the supposition, that, on the security of the property purchased with this sum, further moneys could be raised sufficient to carry out all the purposes in view. The total cost, up to the present time, of forming the street, and purchasing the same thereof, with part of the adjoining frontages, amounts to about £250,000; and it is estimated that a further expenditure of £160,000 will give the Commissioners possession of frontages in Victoria-street and back lands of the annual value of £16,000. The value of this property, at the lowest price usually obtained for ground-rents, is valued by the agents of the Commissioners at £400,000.

Among other plans, the Commissioners propose to devote a considerable portion of the district to the erection of houses on the Scotch principle, for accommodating two families on each floor, in separate sets or "flats" of apartments, affording the same privacy as if each dwelling were entirely distinct. One of these houses, built by Mr. Mackenzie, the contractor for the works, is nearly completed, and is shown as a specimen of what the rest will be, though it is contemplated that some will be on a much larger, and others on a smaller scale. The rents of the apartments in this building are to vary from £50 to £60 a year, including rates and taxes, water and gas, and affording the accommodation of two sitting-rooms, four bed rooms, with scullery, kitchen, and other conveniences.

Another important point which has attracted the attention of the Commissioners is the duty of providing better houses for the working classes, who have expressed a desire to be housed from the pressure of the present improvements, taking a lesson in this respect from the evil occasioned in St. Giles's, when New Oxford-street was forming. As a sample of what may be done, and in the hope of showing that capital may be advantageously invested in lodging-houses, the Commissioners have issued a circular, showing that, for the sum of £9000, they can arrange with builders for the erection of a model lodging-house capable of accommodating not less than 90 persons, to pay 5 per cent on this sum to and a-half for the building, having a frontage of 140 feet, and a depth of 100 feet, and to undertake all the responsibility of the arrangement. The accommodation proposed to be afforded for the rent of 4s. a week is two good rooms, a water-closet, and a scullery for each family. It is in contemplation, also, to erect sets of apartments containing three rooms at 3s. a week, and others containing four rooms at 4s., so as to meet the requirements of all classes.

The Commissioners will not have completed their arduous and important undertaking without effecting a further improvement in the approaches to their new street. At present it is understood they are directing their attention more immediately to the Westminster Abbey end of Victoria-street; and the plan they have in view is, the removal of the railed-in plot of ground where Canning's statue stands, so as to carry on the main line of street to the *new* Westminster Bridge, to be erected a little lower down the Thames than the present bridge. On the site of part of the now railed-in ground they propose erecting a statue of Queen Victoria, in bronze, by Mr. Bell, and have offered to find a site for the contemplated statue of Caxton. A still better suggestion, and one much in favour with the Commissioners, includes an avenue of statues of the great Parliamentary statesmen, Pitt, Fox, Canning, Peel, &c., leading from Victoria street to Westminster-bridge and the Houses of Parliament. This plan has much to recommend it, and the Government, we trust, will not allow any false economy to interfere with its completion.

It would be unjust to conclude a notice of this kind without naming the name of Mr. Mackenzie, the able and energetic contractor of the works, who has, in all respects, carried out the views of the Commissioners and their architect.

VICTORIA-STREET, WESTMINSTER, LAMBETH, AND ST. GEORGE'S CATHEDRAL.

VICTORIA-STREET, FROM THE WEST.

WARWICK RACE PLATE.

This picturesque group in silver, designed and modelled by Jeannest, has been ably manufactured by Messrs. Elkington, Mason, and Co., of Birmingham; and Regent-street and Moorgate-street, London. The subject was very appropriately selected by the committee of the Warwick Town Plate, at the Races during the past week: it represents Queen Elizabeth entering Kenilworth Castle, A.D. 1575, to partake of the princely hospitalities of the Earl of Leicester, who is receiving his Sovereign; a page on the opposite side of the horse, balancing, as it were, the composition of the group. It stands upon a pedestal, upon two faces of which are the arms of Warwick, the county town; the front is semicircular, and bears a bas-relief of Queen Elizabeth and a hawking party; above are repeated the Warwick arms, and upon a shield beneath is inscribed "Warwick, 1851."

This group is altogether one of the most satisfactory race prizes we have seen of late; it was worthily included in Messrs. Elkington and Co.'s manufactures at the Great Exhibition.

THE WARWICK RACE PLATE.—RECEPTION OF QUEEN ELIZABETH BY THE EARL OF LEICESTER, AT KENILWORTH.

Revived Costume.—We have just seen a toilette, composed of a Pompadour robe, recalling the time of Louis XV.; the pattern, a large bouquet of natural flowers thrown here and there, over a white ground, and having the appearance of being embroidered by the hand. The form of the robe was very simple; the richness of the material rendering all trimming unnecessary. The plain body was cut in front, showing a white satin waistcoat embroidered in white silk; the pagodes sleeves with a single fringe. The mantelet was of embroidered muslin, and trimmed with point d'Alençon; the bonnet of rice straw, trimmed with a bouquet of mixed flowers; the inside ornamented to match. —*Le Follet* for September.

The number of persons who visited the Mansion House to view the Egyptian Hall and the state apartments on Tuesday last, amounted to upwards of 1400. Previous to the issuing the regulation of only granting admission on the two days in the week, the numbers varied from 900 to 1000 daily, which, from the family of the Lord Mayor residing in the Mansion House, necessitates the present limitation to the Tuesday and Friday in each week.

PARIS FASHIONS FOR SEPTEMBER.—GIRL'S DRESS.

THE GREAT EXHIBITION FETES IN PARIS.

The Medalet here Engraved has just been struck in commemoration of the recent Exhibition *Fêtes* in Paris, and will hereafter, doubtless, be preserved in the cabinets of the curious, as an interesting memorial of

MEDALET IN COMMEMORATION OF THE GREAT EXHIBITION FETES IN PARIS.

the great international festival of 1851. The obverse has two figures bearing palms and wreaths, and the reverse has the elevation of the Hôtel de Ville, with the date of the commencement of the festivities, August 9, 1851.

PARIS FASHIONS FOR SEPTEMBER.

We must still seek our patrons of fashion at the watering-places; the Great Exhibition visitors from London certainly enlivened the desert rooms of the Hôtel de Ville; and we observed there that white toilettes are much in favour on the other side of the Channel. We remarked that one of the most distinguished guests' *toilette* was composed of an *organdie* dress with straw, with three cut-out flounces; the top of the flounces was hidden by plaits of straw, and the headdress was also of plaited straw. Two ladies who accompanied her also wore white dresses, trimmed with straw, though the hair was differently dressed. Tunics are also much worn by English ladies. Nearly all dresses had something of the tunic about them. Here we much prefer flounces. We saw at the Hôtel de Ville a foreign lady, with a skirt and jacket trimmed with Necarat velvet, richly embroidered with gold, the jacket fitting tight to the waist in the shape of a waistcoat; her headdress was a gold net, with a long tassel gold and red.

PARIS FASHIONS FOR SEPTEMBER.—PROMENADE.

Coloured taffetas, with patterned flounces or scattered running patterns, were often met with, as also white or black lace flounces. Natural and artificial flowers predominated, either as headdress or mixed with the lace. Feathers which are rarely met with at our balls were frequent enough on this occasion, and proved to us that we were, perhaps, wrong to set them aside entirely. They have never been nearer getting into fashion, perhaps on account of their not having been seen for some years.

For walking dresses, let us quit the Hôtel de Ville, and travel on to the beach of Dieppe and Tronville, where fashion is all in its glory. *Toilettes* have great variety; each hour of the day has its own; each occupation creates a change; and there are so many things to do on a bathing day. The morning dress for going to bathe is a *peignoir*, elegantly trimmed *suédé*, made of Scotch woollen plaid, trimmed all down the front with ribbon to match. The *peignoirs* are also made of printed jaconet or cambric muslin, with mantelet to match, with hood. The breakfast, which follows immediately, and which takes place at home, does not change this *toilette* much. Then comes the promenade: either driving or riding, these excursions require strong dresses or habits. The stuffs preferred are nankeen; drill, with small stripes; plaid, or lozenges; *piqué*, white ground; dimity, trimmed with English bands; *brillante* and cambric muslin; and Valencia, with all its varieties. After the promenade, you visit the *établissement* rooms, where the lightest dresses are quite *de rigueur*; for instance, *barège*, with its varied and capricious patterns, or muslin white dresses, and white canezous, with the coloured skirt.

The simple morning bonnet is also laid aside; and in its stead are worn the most graceful, the richest of the season, of open worked straw, leghorns, and rice straws. In the evening silk dresses of a warmer texture are to be seen on the *fête*. Where the sea breeze is felt, silk mantelets and shawls are worn instead of the lace points and scarfs which have lately come into fashion. Again, for night, the ball or concert dresses are *mousseline, grenadines*, or *taffetas*, with three or five flounces; and natural flowers for the *coiffure*.

THE ILLUSTRATIONS.

Gentlemen's Dress has still the same simplicity, and taste of colours, which gives them a *cachet* of distinction and elegance. The last fashion is a kind of jacket coat, of chestnut zephyr cloth, or green or blue, or Lord Grey's green; waistcoat of Valencia, with patterns, quilted with flowers, Louis XV. shape, or *à la chevalière*: trousers without straps, of mixed satin; grey, green, or light drab, according to the shade of the coat or the wearer's complexion.

Boys' Dress.—Dimity casaque, either white or nankeen, edged with a drill lace; and mousquetaire short trousers, with English embroidery, coloured stockings or socks.

Girls' Dress.—Straw bonnet, the front rather depressed, trimmed with ribbons, quite plain; dress of *piqué*, or white muslin, trimmed with a berthe, and

PARIS FASHIONS FOR SEPTEMBER.—BOY'S DRESS.

PARIS FASHIONS FOR SEPTEMBER.—PROMENADE.

with large festooned teeth, with flat apron trimmed likewise; trousers of English embroidery, muslin, or jaconet.

LADIES' DRESS.—Bonnet of white crape, trimmed with two bunches of long green leaves; cashmere scarf; dress, with the body skirted, and three flounces of pink taffeta trimmed with black velvet ornaments put flat on the flounces, and round the bodice—quite new.

THE GREAT EXHIBITION VOLUME of the ILLUSTRATED LONDON NEWS, from JANUARY 1, 1851, to JUNE 28, containing Thirty-five Numbers, and about 700 Engravings, bound in cloth, gilt, price One Guinea; or, in strong paper covers, Sixteen Shillings. All the Numbers of the year 1851 are in print, and may be had at the single price of Sixpence per Copy, or One Shilling for Double Numbers.
Office, 198, Strand.

CALENDAR FOR THE WEEK.

On MONDAY EVENING next at Eight o'Clock, they will give a Grand Musical SOIREE FANTASTIQUE, entitled SOIREE FANTASTIQUE. The Programme will be the occasion presented to expressed before her Majesty the Queen, in the Throne Room, at Windsor Castle, on the 25th of April.—Every Wednesday, at Half-past Two o'Clock, a Morning Performance.

SAINT MARTIN'S HALL, Long Acre.—HERR HENNEN'S GRAND EVENING CONCERT will take place at the above Hall on MONDAY, SEPTEMBER 8, when will appear Mrs ALEXANDER NEWTON, Miss FASS, Mr BODDA, Mr Frederick Hart Herr FRENZEL, instrumental performers Grand Pianoforte, Herr HENNEN. Trombone, Mr HARVEY. Violin, Herr F. BENEDICT. Violoncello, Herr REICHARDT, who will perform Mendelssohn's Trio in D minor, Op. 49. Pianoforte, Mr. BENEDICT, Richardson, and Vocalists, Signor PIATTI. The band will be complete in every department, and selected from the Royal Italian Opera and Her Majesty's Theatre. Prices of admission: Stalls, 5s; Reserved Seats, 3s; Hall, 2s. Commence at Half-past seven. Conductor, Herr HENNEN.

METROPOLITAN NEWS.

THE CIVIC CHAIR.—The forthcoming election of chief magistrate of the city of London begins already to engross the attention of the citizens. The senior aldermen who have not passed the chair are W. Hunter, Esq.; T. Challis, Esq., and T. Sidney, Esq., M.P.

LONDON HOSPITAL.—The usual quarterly general court was held on Wednesday afternoon, in the board-room of this institution, for the purpose of receiving the report of the house committee, and upon other business, Mr. John Davis, jun., in the chair. The number of in-patients received during the quarter had been 1049: cured, 548; relieved, 449; died, 60. The number of out-patients now on the books is 2101; and there are at present 300 in-patients receiving the benefits of the charity. The financial position of the hospital is stated to be in a satisfactory state.

PHILANTHROPIC SOCIETY.—A special general meeting was held on Wednesday, at the London Tavern, Bishopsgate-street; Mr. Gladstone in the chair. The report for the last quarter was highly satisfactory. The number of boys now in the school at Redhill [illegible] was 86, out of which number the last week emigrated to New Brunswick, where situations were in readiness for them on their arrival. The accounts recently received from the late inmates of the school, who are in the colonies, were quite satisfactory.

PRINTERS' PENSION SOCIETY.—On Tuesday evening a meeting of the committee of management, and others interested in the welfare of this excellent institution, was held at the London Tavern, for the transaction of business. The 24th annual report congratulates the subscribers on the result of this long experience, which appears to be the settling down of the society into a regular and steady course. The number of individuals who have participated in its benefits, by annual pensions, since the formation of the institution, have been 224. The sum expended in pensions last year was £565 12s. The property of the society, invested with the Commissioners for the Reduction of the National Debt at the last audit, was £9564 8s. 8d., producing an annual income of £210.

WESTMINSTER ABBEY.—The evening services at Westminster Abbey terminated on Sunday last, in the presence of an immense congregation, several hundreds being unable to obtain admission. The sermon was preached by the Rev. Lord John Thynne, the sub-dean, who briefly adverted to the termination of the series, and the gratifying results which had crowned the efforts of the dean and chapter to provide extra services in the church during the present period of visiting and excitement. The sermon was followed by Handel's sublime "Hallelujah Chorus," finely executed by seventy voices, comprising the usual choir of the church, several gentlemen from St. Paul's and the Temple, some members of the Purcell Club and the Sacred Harmonic Society—all of whom have rendered their services since the commencement of the series. The anthem, presided over by Lord John Thynne, was given on Tuesday night by the dean and chapter, in College hall, to several dignitaries of the cathedral and the gentlemen who assisted in the musical portion of these additional services.

FLOWER SHOW AT THE SURREY GARDENS.—The last flower show for the season of the South London Horticultural Society took place on Wednesday, at the Surrey Gardens, and notwithstanding the unfavourable state of the season, was in no way behind its predecessors in the brilliancy and beauty of the specimens displayed. The dahlias were in great force, much exceeding in size and structure the exhibits of the previous show, while variegated and tricolored and the stiff and perseverance of our metropolitan florists. The tent devoted to muscle lanceors plants was also rich in rare and beautiful flowers, among which the butterfly plant of the tropics was much noticed, and most splendid specimens from the tropics, of which the leaves burst out at the top of its earth basket, while the flowers protrude from the bottom. Some splendid specimens of the *Zalusianthus*, a fine collection of hollyhocks, and a profuse and brilliant collection of verbenas, completed the exotic department of the show. The cut flowers were good, considering the time of year. Of fruits, there was but a small collection, but some of the specimens were of first-rate quality. Some Gollaby plums were much commended, and a basket of figs were quite Eastern in their luxuriousness. The whole of the specimens, both of fruits and flowers, were much and generally commended. A novelty was introduced in the shape of a beautiful vase of wax flowers, contributed by Mrs. Jeffreys, which was thought worthy of a bronze medal. In the evening, the usual entertainment of the gardens went off with all the *éclat* that fine weather, a numerous audience, and excellent performances could impart to them.

THE NEW COURT OF APPEAL IN CHANCERY.—Under the recent act empowering our Majesty to appoint two puisne judges (since who have been given) to be judges of the new Court of Appeal in Chancery, there was given as the "Lord Justices of the Court of Appeal in Chancery," and they are to rank next after the Chief Baron of the Court of Exchequer. From the 1st of next month the court will possess the jurisdiction now exercised by the Lord Chancellor.

THE NEW ROLLS OFFICE.—Great inconvenience having arisen from the limited space afforded to the preservation of the Rolls of Court in the present building, a new one, under the sanction of parliament, has been erected upon, in the space behind the Rolls Court, in Chancery-lane, and runs up back to Fetter-lane. The foundation of the new building has been partially laid down. The new Record Office will be, we are informed, in keeping, with respect to the style of architecture, with the Judge's Chambers, immediately behind which it is to be constructed. The new building is not to come out to the present frontage of the houses in Fetter-lane, a room in front of which makes the present inconvenient and crooked appearance and formation of that thoroughfare more scenily in its aspect, and more adapted for facilitating passenger and other traffic. The new building, we are informed, is to be fire-proof in its arrangements, facilities which have not been possessed before for the inspection of old manuscripts and rare documents.

OFFICE OF INLAND REVENUE.—Several changes have within the last few days been effected in the Excise branch of the Inland Revenue Department. The whole of the solicitors' offices, with the clerks and others attached thereto, have been removed to Somerset House, by which means the entire management of the legal business of the Inland Revenue will be concentrated at one establishment, and not divided, as has been the case since the amalgamation of the stamps and taxes departments. Several of the receivers of the minor taxes in the country are necessary the places vacated in the Excise office in Broad-street, and the whole of the legal business will be conducted by Mr. Pinn and Mr. Tilsey, as solicitor and assistant-solicitor to the joint department. Dr. Acraman, assistant-secretary to the Excise branch, is said to be [illegible] and other arrangements are in contemplation for reducing the charges of the establishment. The detective staff has also been reduced; but this appears a very [illegible] movement, when it is considered that adulteration is nearly all the [illegible] to exist to as great an [illegible]

THE [illegible] IN LONDON.—The Board of Customs having [illegible] to be deposited in warehouses approved as of special security or in specially approved vaults or floors at the legal quays; and as many of these articles are now [illegible] or subject to revenue duties the board have considered it advisable to [illegible] and such but and it has therefore been resolved that the following [illegible] articles to be in future warehoused at the legal quays, in warehouses of special security, in specially approved rooms, floors, or vaults only, to established for that purpose in the regulations of the minute, dated July, 1845, on the subject; viz.—Agate, set; almond paste, amber, manufactures of; beads, or lighting beads or bugles; brass powder; bronze manufactures; bronze powder; buttons, of all sorts; cards, playing; carmine; crystal, cut or manufactured; crystal beads; clocks; dice; essences of all sorts, except peppermint; fans, of all sorts; feathers, ornamental dressed; flints, paddy bird; ditto, not otherwise enumerated, dressed; flowers, artificial, of all sorts; gauze of all sorts; gloves of leather; hair or goats' wool, articles manufactured of; hats, ornamental, of straw, chip, or fancy [illegible]; jewellery, precious stones, set; lace of all sorts; linens, viz cambrics and lawns, French; lawns, not French; mace; mercury, prepared; musical boxes; mummery, not wax; opium; pearl and mother-of-pearl, articles manufactured; plated or gilt and silver; plating, or other manufactures fit for making [illegible] bonnets, of hat, cane, or horsehair; plaiting of straw; quinine, sulphate of; [illegible] silk manufactures of a kind; silkworm gut; silver, gold, or plated articles; [illegible] fined of; spirits, cordials, and strong waters of all sorts; stones, snuffs, tea, tobacco, in places especially sanctioned by the Board for that purpose; truffles; [illegible] watches; water, Cologne; wine of all sorts; woollens, and cotton manufactures of, wholly or in part made of worsted, and goods warehoused for exportation on y.

THE NEW ROAD.—The Board of Directors of the parish of St. Pancras met to decide on the figure of the New-road, which it will be remembered, they have been keeping closed to carriage traffic, from the new church to King's-cross, since a few days before her Majesty's departure for the north. It was resolved that the works should be commenced on the 22nd inst., by contract, and it was adjudged to Messrs. Pratt and Sewell, and, at the rate of 12s. 11d. per yard, will amount to £3800. It is to be paved with Aberdeen and Mount Sorrel granite, of 6 inches by 3 inches. Such dissatisfaction has been felt, from the [illegible] of the daily loss sustained by the public through the closing of this thoroughfare, its repair is not proposed with more vigour.

JURY LISTS.—On Tuesday notice was given, that, in the next three months, jury lists will be published on the church doors for the next three Sundays, and that all persons sixty years of age or upwards must claim at the [illegible] session to be exempted, otherwise they will be bound [illegible] to the second duties are likely to be imposed under a recent act.

[illegible] made by the [illegible] to take the annual [illegible] the district [illegible] had risen to £8,791,957; whilst the [illegible] in the former year, £640,006 7s. 6d., and in the [illegible]

STAGES.—[illegible] the Queen's [illegible] to the Queen's Theatre, [illegible] that arrangements are [illegible] to apply at No. 4, on the last side of the central avenue, for letters from [illegible] of the United Kingdom, addressed "to be left to called for," and [illegible] notice to the effect that strangers are informed that on leaving London they may have their letters forwarded to them on making application to the [illegible] ing to that effect.

ST. BARTHOLOMEW FAIR.—On Wednesday, at twelve o'clock, the Lord Mayor made the accustomed proclamation for opening this fair and the court of Pie Poudre. Notwithstanding the meagre reasons of the fair, now shorn of all its [illegible] and Wombwell's [illegible], a goodly number of our own countrymen, [illegible] spot.

GREENWICH BATHS AND WASH-HOUSES.—This establishment, which has been erected at a cost of less than £10,000, including the purchase of the freehold, was opened on Monday; it contains 42 separate, and two large plunge baths, with about 30 wash-tubs. The building stands at the west entrance of the town, and nearly opposite to the railway station. The commissioners have issued annual tickets at one guinea each, and twenty-five have already been taken. We believe this is a practice not hitherto adopted at similar establishments.

BLACKFRIARS BRIDGE.—This bridge is now open for traffic, and the improvements, such as they are, have been effected with great taste and skill, and, we trust, with equal solidity and security. The wooden girders in the main under the two outer arches, it being deemed unsafe to remove them. The weight upon them has no doubt been slackened; but if, as engineers say, the mere weight on the top of the arch the firmer it is, the effect is presented from above is only an indication of the weakness below. Those portions of the stone bulwark which have been removed from the side of the parapet have been filled up with a deal pallisade, painted so nearly as possible of the same colour as the stone fencing, and presenting a very pleasing appearance. By a casual observer no difference can be seen, but on examining the alterations minutely it will be seen that they are but temporary improvements, "got up" for the purpose of staving off for a time the ultimate fate (*i. e.* the removing) of Blackfriars-bridge.

FIRE.—On Sunday morning the extensive show-rooms of Messrs. Horne and Co., carriage manufacturers, of 93, Long-acre, fell a prey to a most destructive fire. The building was only finished about two years since, and at the outbreak of the fire contained as many as 100 carriages. Of these many were on the lower floor, raised a foot or so above the level of the street, and a considerable number were in the gallery of the next story. Above these were the workshops appropriated to the use of the artizans engaged in the lighter branches of the business. The upper floor chambers having long been occupied as a principal as a private residence by Mr. Mitchell, foreman of the establishment, and his family. The discovery of the fire was made between three and four o'clock, by a policeman. Before the engines arrived the fire penetrated to the upper floor, and now rushed through the roof, and various upper windows, while immense flakes of burning material were wafted by the strong breeze over the tops of the houses along the north side of Long-acre, threatening destruction to all in their course. On the arrival of St. Martin's Hall, which adjoins the manufactory, but happily it remained unscathed. The flames travelled completely round the building, and descending three floors, destroyed all that they encountered, leaving only the empty probability of the entire range of premises falling a prey to the fury of the devouring element. The floor of the third story, constructed on a fire-proof principle, seems to have assisted the firemen to arrest the progress of the flames, but it was late in the day before the engines could be withdrawn with safety.

SERIOUS ACCIDENT.—STREET ORGANS.—On Tuesday evening, as Mr. Louth, of 127, New-road, Chesnee, was driving his horse and gig, in Piccadilly, the animal started at the sound of a barrel-organ being played by an unmanageable, darted of at a furious pace towards Regent-street, which was thronged with people and vehicles. Numerous collisions took place, and several persons were knocked down and much hurt; but the worst case was that caused by coming in contact with a heavily laden wagon, and Mr. Louth was seriously injured. The horse, with shafts dangling at his heels, was not secured till he reached Charing-cross. Two persons, Mr. and Mrs. Byrne, of 12, Buffalo-house, Gilbert's-passage, Oxford-street, who were knocked down at the Regent-circus, were removed to Charing-cross Hospital in a very dangerous condition.

CHARGE OF MANSLAUGHTER AGAINST A POLICE CONSTABLE.—On Wednesday morning at the Mansion House, Mr. Alderman Wilson gave his decision in the long-pending inquiry as to the charge against Benjamin Colle, City police-constable 548, of causing the death of William Cogan, by striking him on the side with his truncheon, on the evening of the deceased's residence, No. 18, Plumtree-court, Shoe-lane, on the morning of the 6th of July last. The inquiry had been instituted in consequence of a memorial presented to Sir George Grey, who at once forwarded it to the Lord Mayor; and his Lordship, acting under the advice of the City Solicitor, caused proceedings to be adopted, when out to the prisoner Cole being placed at the bar on the charge of manslaughter. At the sitting of the Court on Wednesday the prisoner Cole surrendered in discharge of his bail. The character of the offence charged against Cole will be understood from the opening observations of Alderman Wilson's very able and perspicuous summing up of the evidence. He said:—"Since we last met I have read over and studied very attentively all the depositions which were taken before me, as well as the evidence given before the coroner's inquest on this subject. I have also, in company with an officer, visited Plumtree-court, and have examined Mrs. Lang's room, and the passage of the house No. 18, in which the deceased lived, and, after such examination, been enabled, not only thoroughly to comprehend the whole given by the different witnesses, but I have also been enabled to make up my mind as to the degree of credit to be given to that evidence. The first witness, John Lock, states, that as saw the deceased run up the court a little before twelve o'clock, a policeman running after him, and that he heard the policeman, on his return down the court, say of the deceased, 'I have got the b——r, and he might is over,' that when the policeman was gone, the deceased came down stairs again, and the witness advised him to go and change his coat, that the police might not know him; that between one and two hours after this the policeman lay hold of the deceased by the collar, take a truncheon out of his pocket, and make use of it over the body and right arm of the deceased, and above the deceased into the house from which he came. The witness heard the policeman beating the deceased; and that when another policeman came up, and asked what was the matter, the witness said that a policeman was beating a young man most unmercifully. The witness saw the policeman who made the inquiry (Lockyer) turned on the bull's-eye, and that the witness then saw the policeman who shoved the deceased into the passage strike the deceased a blow under the right ear, when the deceased said, 'For God's sake, don't murder me, and I'll not come down stairs no more to night.' The evidence thus given by Long appears to have been confirmed by that of Mary Lyons." Having gone minutely through all the evidence, Alderman Wilson concluded observing, that if the case rested there, he should thought it right, for the ends of justice, that a further inquiry should take place. It would also be more satisfactory on behalf of the police themselves. He was satisfied from the whole evidence given, that the prisoner was guilty, and that at the Central Criminal Court, where he would be tried by a jury under the direction of one of the learned judges, and have the aid and assistance of able and learned counsel, he would be fully and fairly dealt with. Particular stress had been laid upon the character of several of the witnesses, they having been in custody and subjected to imprisonment, but that that had nothing to do—it did not make their testimony worthless—if it was confirmed and the external injuries upon the head of the deceased had been inflicted by the prisoner Cole. Those external injuries corresponded with the internal injuries. He would not, then, be doing his duty if he did not commit the prisoner upon the charge of manslaughter. Mr. Lewis (for the prisoner): I hope the same amount of bail will be accepted. Ald. Wilson: No, not in an important case like this. I must require the prisoner himself in £200, and two sureties in £100 each, or four persons in £50 each, and himself in £200, for the prisoner's appearance at the next sessions of the Central Criminal Court. Two of the City police inspectors, Cubitt and Mitchell, immediately became, and were accepted as, bail for the prisoner.

BIRTHS AND DEATHS.—For the week ending Saturday, August 30, there were registered in the metropolitan districts, the births of 702 boys and 669 girls, in all 1401 children. The average number during the last five years was 1,277. The deaths numbered 1051. During five weeks that have run since July 26, the deaths, except in one instance, have ranged above 1000, or 1 051 deaths now returned indicate, not only a very [illegible] in London, as compared with more open districts of the country, but an increased amount as measured by former experience in the metropolitan districts at the same season of the year. In the corresponding week of 1850 the deaths from cholera had nearly attained its highest point, 4,756 deaths were registered in London; but with that and another exception, the deaths in the corresponding weeks of 1841-50 did not reach 1000, and were generally below 900. The whole number of persons who died last week nearly one-half less, not completed their fifth year of existence. Of the whole number of deaths more than one-third are caused as caused by epidemic diseases, among which [illegible] diarrhœa, which [illegible] ale. This class, which numbered 3.4 in the previous week, [illegible] 78; it includes small-pox, which was fatal in 17 cases [illegible] measles, hooping-cough, which count respectively 18, 20, and 2 [illegible] cases are due to typhus, remittent, and other [illegible] mery, and 28 to cholera. On the 26th August, at 9, Speedy-place, Gray's-inn-lane, the son of a coach painter, aged 2 years, died of "typhus, after 4 days' illness." The medical attendant makes the following observations in connection with this case: "There is a drain in speedy-place which runs under the floors, and emits the most abominable and injurious stench." In the four houses, No. 6 to 10, there are several cases of very bad fever. I suggested the lime-washing, and such other measures as were calculated to prevent the further spread of the disease, but nothing has yet been done to relieve the occupiers." In a family at Upper Ashley, two children have died of "scarlatina contagiosa" within 7 days; and in another in Gibra tar-place, Hackney-road, two have died within the same period of the same disease, while a third is dangerously ill. Diarrhœa appears to increase; the following numbers, which comprise no one 24 hours, in two cases 3 days, in one case 5 days, in one 6 days, in two 8 days, and in one 28 days. Of the two cases of short [illegible] one occurred amongst the Greenwich pensioners, and another, described "Asiatic," to Herb rt-street, Hoxton. Ten pensioners died in the Royal Hospital, Greenwich, between the 22nd and 27th of August: one at the age of [illegible] years, another 64, and the rest between 14 and 80 years.

METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean height of the barometer in the week was 29 795 in. The mean temperature was only 56·4 deg., which is nearly 4 degrees below the average temperature [illegible] On Thursday it was nearly 6 deg. below the average of the same day, on Friday nearly 11 deg., and on Saturday nearly 8 deg. below the average. The wind was generally in the west, but towards the end of the week was in the north.

COUNTRY NEWS.

THE QUEEN'S VISIT TO LIVERPOOL.

At the weekly meeting of the Liverpool Town Council on Wednesday, Mr. Mayor said he had the gratifying intelligence to announce that it was the intention of the Queen to visit the town of Liverpool on the 9th of October next.—(Loud cheers)—and to proceed on the same day to the mansion of the Earl of Ellesmere, at Worsley Hall. His Lordship then read the following letter to the Council:—

Balmoral, 30th August 1851.—Sir,—In reply to your letter of the 26th, I have the honour to inform you, that it is her Majesty's intention to pay a visit to the town of Liverpool on the 9th of October next, and to proceed on the same day to the Earl of Ellesmere's, at Worsley.—I have the honour to be, sir, your obedient servant, J. RUSSELL.—The Mayor of Liverpool.

His Worship said he was quite sure that every member of the council, as well as the public, would gladly avail themselves of the opportunity about to be afforded them to testify to her Majesty their loyalty, and that they were capable of worthily appreciating the honour she proposed to confer on the town. (Loud cheers.) He therefore suggested the appointment of a committee forthwith—consisting of the chairman and vice-chairman of the several committees of the council, with the understanding that every member of the council be considered, *ex officio*, entitled to assist that committee—to make such suitable preparations for the reception of her Majesty as the important occasion called for.

Mr. Alderman Procter seconded the proposition of the Mayor, which was unanimously accepted.

Mr. Turner, the chairman of the dock committee, said that that body would contribute to the preparations made by the council in any manner which might be most desirable. (Cheers.)

Mr. J. B. Lloyd said, that at a meeting of the committee of the courts of law, it had been determined to remove the wall now erected round St. George's-hall, and to put up a barrier of posts and rails of some neat and tasteful design, where the permanent railing would be placed. The doors were also to be laid with temporary boarding, and steps furnished to each court, to give some idea of what the courts would be when finished. It was proposed, if her Majesty should visit the hall, that she should enter at the north end, see the civil court, go down the hall to the criminal court, then on the southern portico, and so depart by the eastern portico. The further arrangements of the committee contemplated that the public should be admitted, of whom they expected to accommodate about 2040 in the hall. (Great cheering.)

Mr. Brumley Moore and other councillors made various suggestions, when the committee was appointed as proposed.

The *Bradford Observer* states that the conductors of one of the cheap weekly literary publications are offering prizes respectively of one hundred guineas, fifty guineas, and twenty-five guineas, for the best three solutions of enigmas.

A CASE OF CONSIDERABLE IMPORTANCE TO EMIGRATION AGENTS AND OTHERS was also declosing a new feature in the Transatlantic trade, came before the Liverpool magistrates on Monday morning. The facts [illegible]

A lady named Byrne, with an infant and servant, were entered as passengers by the ship *Ashburton* to New York. Mrs. Byrne, it appears, is a widow, and blind of one eye, and, after the party had gone on board, they were objected to by the captain, who alleged that a recent act, passed by the Congress of New York, prohibited the landing such unprotected persons, under a heavy penalty. The act renders the captains of vessels responsible for the maintenance of persons landed in New York who are either "lunatic, idiot, deaf, dumb, blind, infirm, maimed, above the age of sixty, under the age of thirteen, or women without husbands, having families." The captain of the Ashburton having received a bond of indemnity, and pressed the matter for a decision. Mr. Mansfield, therefore, decided that if the passage-money must be returned, together with a shilling a-head over five. Byrne and her servant were then taken on board, and all is now at rest. The case excited great interest, being the first of the kind brought before the Court.

THE GREAT HALF-YEARLY HORSE AND CATTLE FAIR, BRISTOL.—The usual half-yearly Bristol fair commenced on Monday, Sept. 1, and was held on that day and Tuesday. The attendance of horses was very good, both in number and quality, and good horses sold well. There were some good carriage horses, and the show of hacks was good. The stock of horses was of rather a [illegible] than usual. Fat beef was in short supply, with rather a slow sale, at from 4d. to 4½d. per lb. There were not many fat sheep, but the few on offer sold [illegible] per lb. There was a good show of store sheep, but of inferior sorts; there was a fair sale. There were several pens of Cotswold rams, which sold well. Devon store beasts were rather scanty in number, for which high prices were asked and obtained.

DESTRUCTIVE FIRE AT BRISTOL.—At about two o'clock on Tuesday morning a fire broke out in Redcross-street, St. Paul's, Bristol, one of the most densely populated portions of the city, which soon became enormously spread terror and alarm throughout the neighbourhood; and from the courts and houses were to be seen the male and female inhabitants rushing forth in almost a state of nudity. The fire-ke ping at the eaves was soon perceptible; and by three o'clock [illegible] when were in one vast sheet of flame, illuminating the horizon for miles, and distinctly visible from all the heights surrounding the city. The whole of the premises and valuable stock were totally destroyed. The names of the firm in the house were Messrs. Alverton's valuable stock, to the amount of upwards of £2000, together with all the tools belonging to the eighteen workmen employed, valued at nearly £200, were consumed. They are insured in the Alliance Office for £800, have been entirely destroyed. They were insured in the Alliance Office; but the workmen are totally uninsured, and the Messrs Laverton to only £500 in the Sun Office.

FEARFUL AND COLLIERY ACCIDENT.—Of all the fearful alarming colliery accidents which of late have been so rife in the immediate vicinity of Bristol occurred on Monday afternoon, between two and three o'clock, at the Deep Pit, belonging to the Messrs. Bright and Co., at Hanging-wood, about four miles from that city. A "turn" of hands were ascending the shaft at the time. They were nine in number, and had arrived at the "stage," at the top of the pit, when they got into the bucket, when, to the great horror of the engineer superintending the landing, the bolt of the reversing handle broke off, and, being aware of the consequences that would follow, he laid hold of the eccentric with his hands, and endeavoured to lift them, which had he succeeded in doing, the accident would have been prevented. Finding that he could not effect this by himself, he called out to a man, named George King, to his aid, but before the rods could be lifted the accident had happened. The names of the unfortunate men who were being landed are as follows:—Bryant, Gaine, Dix, two Parkers (relatives), Bright, Wiltshire, English, and Newman. The latter, when the bolt broke, seeing that they were being hauled up over the summer wheel, tried to save himself by jumping off; he did, however, jumped short, and fell right down the shaft, a depth of 147 fathoms, and was dashed to pieces by the fall. Stone, the only married man among them, escaped with a severe scalp wound, as did also a lad named Bryant. The other poor fellows went over the shiver-wheel, and were precipitated, as was the heavy iron bucket (3¾ cwt.) to the ground, a distance of 25 feet. They were all more or less scalped, and severely injured in one part or another. The Bristol Royal Infirmary, in carts, where every attention was immediately paid to them. It was found that Dix was suffering from a compound fracture of both bones of the right leg, a simple fracture of the right thigh, extensive lacerated wound of the left leg, and contusion of the scalp; his leg has since been taken off by Mr. Morgan. English had a fracture of the scalp, and an extensive wound on the cheek, exposing the cheek-bone; Gaine had a fracture of the right thigh, and other injuries and contusions. But faint hopes are entertained of the recovery of either of the parties. The rest are suffering from severe contusions. The pieces of the broken bucket were in the possession of Samuel Osborne, the blacksmith who made it. There does not appear to be any flaw in the iron, and it would seem that it is nothing to lead one to suppose but that the affair was of a purely accidental nature. The remains of the poor man Newman were recovered a little after four o'clock.

SINGULAR AND FATAL ACCIDENT.—The death of Henry Sudell, Esq., of Ashley House, Wilts, which occurred a few days since, resulted from a somewhat remarkable cause. Mr. Sudell had called at the Queen's Head Inn, at Box, and whilst conversing with some gentlemen there, he saw a dog and dandy spring at one of them, Mr. Lewis, of Colerne. Mr. Sudell quickly stepped forth to rescue the dog, and Mr. Lewis, being equally on the alert, struck a heavy aimed a blow at it with his walking stick, but, unfortunately, missed striking the animal, struck Mr. Sudell's hand. Inflammation was the result, and the disease increased, notwithstanding the assistance of Dr. Sprague was obtained, but, notwithstanding that gentleman's efforts, mortification took place, and Mr. Sudell expired on Thursday last.

THE CLOSE OF THE SEASON.—The London season was last week rapidly [illegible] to a close. No more cards and no more parties; the belles of the ball were refreshing their pale cheeks and languid limbs in the tepid retirement and shadows of the unmounted sea; the whir of life ceased in the parks: strange, odd faces and odd hats loomed strangely across the [illegible] the house in Belgravia [illegible] burials gradually closed their eyes, as though worn out with [illegible] hours; the cabs thinned, and the smoking rooms became deserts; beds rose [illegible] and the fashionable world began to leave, and to [illegible] watering-places; shop windows got careless; the papers got stupid; cabmen got lethargic; [illegible] got cold; and, in fact, nearly everything and everybody appeared relapsing into misery.—*The Month, by Albert Smith and John Leech.*

The subsidence of one of the piers of Blackfriars-bridge has since led to the propriety of Waterloo-bridge the wisdom of early taking steps to prevent a similar misfortune to the latter. With this view, a vast quantity of broken stone has been discharged into the bed of the river, around the piers most likely to be injured by the continual washing caused by the river.

On Tuesday afternoon, one of the vessels employed in this work, [illegible] with [illegible] was forced by the tide with such force up to the bridge that the mast dislodged a considerable portion of the coping of the balustrade.

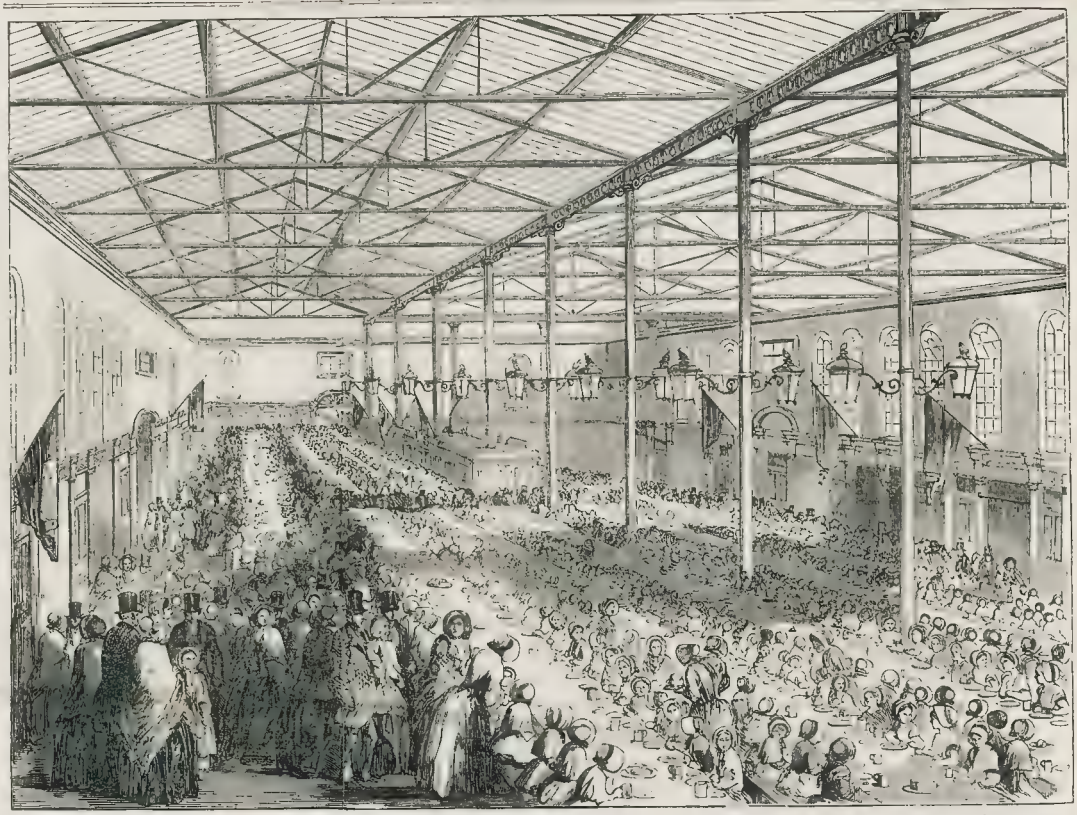
DEPARTURE OF THE QUEEN FROM THE RAILWAY STATION, DONCASTER, FOR THE ANGEL HOTEL.

THE QUEEN'S VISIT TO THE NORTH.

In our Journal of last week we detailed the principal incidents of the Royal journey, to the arrival of her Majesty at Doncaster, on Wednesday.

The Queen and Prince Albert, after receiving the address, were conducted through the main entrance to the railway station, which was covered with crimson cloth, to the state carriage, immediately at hand. Here the reception was very enthusiastic. On both the platforms ladies waved their handkerchiefs, gentlemen cheered to their utmost, hats in hand, and the children caught up the hout of acclamation and hearty greeting, which was most graciously acknowledged by her Majesty and the Prince. The scholars of the National School, who were placed in front of their building, on an elevated platform, then sang "God save the Queen." One pleasing feature was the presence of the pupils the Deaf and Dumb Institution, and the venerable founder of the charity, the Rev. C. W. Fenton, vicar of Malterway, the honorary secretary; the latter cheering with the greatest enthusiasm, which was recognised by the august visiters. "Welcome Victoria" on the triumphal arch was acknowledged by her Majesty with a graceful smile. On approaching East Laith-gate, with crowds of people

ARRIVAL OF HER MAJESTY AT THE ANGEL HOTEL, DONCASTER.



ENTERTAINMENT GIVEN TO THE SCHOLARS OF ALL SECTS, AT THE MARKET-HOUSE, DONCASTER, ON THE ANNIVERSARY OF THE BIRTHDAY OF PRINCE ALBERT.—(SEE NEXT PAGE.)

extending the whole length of the road, the cheering was also most vociferous. On Hodgson's platform were placed the young gentlemen of Edenfield Academy, while banners floated in the breeze; flags were hung from different points, and bells rang right merrily; in fact, Doncaster manifested such an outburst of loyalty as could not be excelled in the great military progresses of former Kings. Moving onwards, the Royal *cortège* reached the second triumphal arch. Before doing so, it passed several fine larch trees, which were temporarily planted to give a better effect to this part of the road.

Looking from the second in the direction of the third triumphal arch opposite the News-Room, the spacious area immediately in front was one dense mass of people, with, however, an opening along the crown of the road which was kept clear by the police. The windows, and balconies, and roofs on each side were densely crowded with respectable people. As the carriage containing her Majesty and the Prince emerged from beneath the triumphal arch, one loud rushing shout, taken up on all sides, made the welkin ring with a welcome as hearty, as enthusiastic, and as sincere as ever struck the ear of Royalty; and it was taken up with equal enthusiasm from balconies, windows, house-tops, and from every elevated position from which a view could be obtained

HER MAJESTY'S ARRIVAL AT THE TEMPORARY TERMINUS, EDINBURGH.

The crowd had no sooner recovered, than they shouted, as one man, an universal welcome, when the Queen descended from the state carriage, at the Angel Inn, and took the arm of Prince Albert in the presence of the Mayor, the Vicar, the Recorder, the Town Clerk, and the Earl of Cathcart; Mr. Joseph Foster bearing the mace on the left of the Royal carriage, the sovereigns previous to presenting arms. The Royal standard was immediately hoisted above the Angel Hotel. The Queen, in the most gracious manner, bowed to the above gentlemen. Then followed another enthusiastic cheer, which continued when her Majesty made her appearance at the drawing-room windows. During this strong expression of feeling, the Prince of Wales and Prince Alfred descended from their carriage, and were greeted with an universal chorus of voices. The Prince gracefully acknowledged the compliment. The Princess Royal and Princess Alice were also heartily received. Both the Princes and the Princesses were accompanied by their tutor, Mr. Birch, and by their governesses, Miss Hildyard. The carriage which contained the children of the 93th Regiment under the command of Major Blackburn, were then dismissed, and a portion mounted guard. The officers present were, in addition to the gallant Major, the Hon. Captain J. H. Thurlow, the Hon. Lieut. W. S. Keox, Lieut. Gubbins, and Ensign Records. There were 110 men rank and file, besides the band, consisting of 28 men from the 2nd Life Guards. As soon as the Royal party commenced, the appearance in front of the Angel Hotel became comparatively quiet

The Angel Hotel had been tastefully prepared by Mr. Pie with flowers and evergreens. A beautiful bouquet from Lady Charlotte Guest was sent to the Angel Hotel for her Majesty, which was most graciously received. Besides this, was an elegantly formed crown of flowers from the same lady.

In the evening, a sumptuous entertainment was given at the Mansion House, by George Johnson, Esq., Mayor. There were upwards of 130 guests

There was also a brilliant display of fireworks, which was witnessed by many thousands, although the rain fell heavily.

At a very early hour on Thursday morning the town was astir; a crowd of persons were observed hurrying along the respective thoroughfares in the direction of the station ground, opposite the Angel Hotel, and at other points favourable for seeing the Royal *cortège*. The Mayor and Corporation proceeded from the Mansion house, with the Vicar, Recorder, and the officials, similarly attired as on the preceding day, and waited in procession in the station, with four troops of Yeomanry Cavalry, with their respective officers, commanded by Captain Walker, took their position on each side of the road between the second and third triumphal arch. At the platform, Lord Cathcart, and his aides-de-camp, awaited the approach of her Majesty. Along the whole line of the road her Majesty was cheered by the assembled throng on foot, in the windows, balconies, &c. On entering the station, through the booking-office, the military presented arms. Mr. Danson, the chairman, opened the carriage door for her Majesty, who was followed by Prince Albert, the Prince of Wales, and the Princess Royal. The other Royal children went into the next carriage. Lord John Russell and the Royal suite having taken their seats, all was now in readiness for departure. Her Majesty and the Prince remained standing for some moments in the state carriage, bowing in the most gracious manner to the ladies on the platform, and to the other parties in the station, the band playing "God save the Queen;" and precisely at nine o'clock the *chant du départ* was sounded, and the train was put in motion.

DONCASTER TO EDINBURGH.

The Royal train went at a good pace till it approached Nottingley, where the line traverses a largecoser bed at a considerable elevation, so as to require some caution on that part of the journey. The carriages were slowly along the ridge of the high spot, and at 9 55 passed very leisurely through the miniature tubular bridge over the Aire and Calder Navigation. The train stopped outside York at 9 58, where the Great Northern directors took leave of her Majesty, and the directors of the York, Newcastle, and Berwick, with Mr. Leeman, chairman, took the train in charge. The engine of the Great Northern Company was then changed for one belonging to the York, Newcastle, and Berwick Company, driven by Mr. Harrison. Some thousand of people were assembled near the station, who cheered the Queen most enthusiastically. The train proceeded northward, and arrived at Darlington at eleven o'clock, where the engine took in water, and the Chief Bailiff paid his respects to her Majesty, accompanied by the most respectable inhabitants of the borough, while the approaches to the station were densely crowded. The rest of the journey towards Newcastle did not offer much to remark upon, except the extraordinary spectacle presented by the iron people—rugged hills of burning slack and small coal heaped up near masses of machinery and giant chimneys, rows of squalid houses, and vast pillars of dark smoke shooting up from the numerous pits in the vicinity of the line on the northward, with stately mansions or smug farm houses shining in the distance; and instead of the farm labourers, with their ruddy faces, one beheld crowds of women and children, with all the air of a half-starved race.

Her Majesty passed through Newcastle at ten minutes past twelve P.M., and arrived at Berwick about five minutes past two, and left about ten minutes past two, having been joined by a carriage containing Mr. Hale Sanderson, the deputy chairman, and other directors of the North British Railway.

At twenty-five minutes past three o'clock, the pilot engine arrived at Edinburgh; and in a few minutes the train, with Royal party entered the station, which about twenty minutes of its start from Berwick. All along the line clusters of people were collected to cheer the train as it passed. There was only one stoppage between Edinburgh and Berwick, namely at Grant's House, and there only for a minute or two for supplying the engine with water

Her Majesty was received at the railway station at Edinburgh by the Duke of Buccleuch (the Lord-Lieutenant of Mid-Lothian), General Riddell, the Commander of the Forces in Scotland, and Sheriff Gordon Prince Albert, on alighting from the carriage, cordially shook hands with the noble Duke, and also with General Riddell and Sheriff Gordon. Her Majesty also graciously acknowledged them; and, leaning on the arm of the Prince, walked up the platform of the station, in conversation with the Duke of Buccleuch: the Royal children, Lord J Russell, and the other members of the suite followed. Her Majesty, after acknowledging the cordial cheering of the people, stepped into the state carriage, followed by the Princess Royal, the Prince of Wales, and Prince Albert; the two Princesses, Lord John Russell, and the suite occupying three other carriages The Royal *cortège* then proceeded at a slow pace in the direction of Holyrood Palace; and at every stage of its progress the Queen and her Royal consort were welcomed with the heartiest acclamations from the immense crowd that lined the road as well as the neighbouring heights. On her Majesty arriving at the Palace, the band of the 93rd Regiment, as the band of the Sutherlandshire Dragoons did at the Waterloo Bridge, struck up the National Anthem. Her Majesty was received at the Palace by Mr. Rutherford, W.S., on the part of the Duke of Hamilton, the hereditary keeper of the Palace. The High Constables of Edinburgh had the honour of escorting her Majesty from the station to the Palace; and at the same time the High Constables of Easter and Wester Portsburgh and the Canongate were drawn up. As soon as her Majesty reached the Palace, a Royal salute was fired by the guns of the Castle, while the Royal standard was hoisted.

About a quarter to five o'clock, the Royal carriage drove up to the Palace gates, and in a minute or two her Majesty, accompanied by Prince Albert, the Prince of Wales, and the Princess Royal, alighted from the carriage, and walked, arm in arm, up the lane, and, entering the carriage, drove off at a rapid pace along the road leading to the new road that was made around Arthur's Seat a few years ago. Col. Phipps and Col Grant rode on opposite the Royal carriage.

In the course of the evening the honour of knighthood was conferred on Mr. Johnston, the Lord Provost of Edinburgh. The Royal dinner party, at eight o'clock, included the Duke of Buccleuch and the members of the suite.

EDINBURGH TO BALMORAL

On Friday morning her Majesty and the Royal family left Holyrood *en route* to Balmoral, for the honour before the hour appointed for the departure of the Royal party, crowds poured into the park. Shortly after seven o'clock the military and police took up positions similar to those they had occupied on the preceding day, the Duke's walk being again lined with infantry, flanked by a detachment of cavalry at either end of the Royal route. Both sides of the way were crowded with anxious spectators, and many were contented to view the Royal *cortège* and the time-expired from the adjoining houses.

Her Majesty appeared in front of the Palace, and took her seat in the carriage at exactly eight o'clock, and was followed by Prince Albert and the elder Royal children. The Queen wore a *plaid* and shawl of the Royal Stuart tartan, and a yellow silk-lined bonnet, with feather. The Prince Consort was again dressed in a light grey tweed coat, closely buttoned. The young Princes were dressed alike, in the Highland costume of the shepherd's plaid pattern, and the Princesses were also plainly, but very neatly attired. Lord John Russell and the Royal suite followed.

The usual signal having been given to the Castle, the Royal cavalcade drove off amidst the sound of trumpets and the booming of the Castle guns. The *cortège* moved slowly till it had passed Holyrood, and, amidst the buzzas of the assembled throng, the auspicious journey then moved along at a brisk pace.

The Royal party reached St. Margaret's station at ten minutes past eight. Her Majesty quickly alighted, and was conducted down the steps by Prince Albert and the Duke of Buccleuch. The Queen was at once met by the Earl of Mar Kinnoull and the Royal suite having taken their seats, all was now in readiness for departure. Her Majesty and the Prince remained standing for some moments in the state carriage, bowing in the most gracious manner to the ladies on the platform, and to the other parties in the station, the band playing "God save the Queen;" and precisely at nine o'clock the *chant du depart* was sounded, and the train was put in motion.

CELEBRATION OF PRINCE ALBERT'S BIRTHDAY AT DONCASTER.

Of all the entertainments in commemoration of the visit of her Majesty to Doncaster, we know of none more gratifying than the *fête* given to the children of the town on the afternoon of Tuesday, the 26th ult., being the birthday of the Royal Highness Prince Albert. According to previous arrangements, the children assembled in the Horse Fair, at half-past three o'clock. Precisely at that time, the scholars of the Baptist Sunday-school, Spring-gardens, made their appearance on the ground, headed by a banner. Many of the children carried small hand-flags, with various mottoes—such as "Victoria and Albert," "Long live our noble Queen," "God bless our Queen," &c. No sooner had they been placed in three than the Parish Church Sunday-schools were seen advancing from Wood-street, with their war by Vicar, the Rev. Dr. Sharpe and Mrs. Sharpe, the Rev. Robert and Mrs. Sharp; Mr. Testa, and a goodly number of teachers. The girls had a banner inscribed C. R. Alford, with a banner bearing the words "Christ Church Sunday-school," and on another "The Queen. God bless her At the same time, a large procession of five hundred Wesleyan children, approached with their banner. Immediately afterwards came the Primitive Methodist Sunday-schools, Duke-street, attended by their ministers and teachers, with their banner. The children of the Catholic Sunday-school, about 80, were present, but had no banner. Here were met the Church, the Wesleyan, the Independent, the Catholic, the Primitive Methodist, and the Baptist more than two thousand children and teachers. Thus they were all assembled in the Market-house, where 13 tables were prepared for their entertainment. The whole of the immense building was completely filled by the children and visitors; and although it is calculated to be of several thousand persons, it was inadequate to accommodate anything like the number that sought admission. When all had got seated, the following grace was sung, accompanied by the band of music stationed near the centre entrance:—

> Be present at our table, Lord.
> Be here and everywhere adored.
> These mercies bless, and grant that we
> May feast in paradise with Thee.

Each child was then plentifully supplied with tea and plum-cake by the different teachers and committees of management. The entertainment consisted of 1800 buns, weighing 13 cwt., each supplied in two hundreds by nine different bakers, at 3d. each. The tea-cakes were excellent. The tea used was made from 3 lb., boiled in copper vessels at the Black Bull, the Dolphin, and the Plough. Thirty gallons of tea, 36 lb. of sugar, and 25 lb. of cream was allowed to sweeten the tea. For each copper were engaged four men to carry the tea to the building; and it is satisfactory that the whole of these arrangements were admirably carried out by the committee, consisting of the Rev. Dr. Sharpe, Rev. C. R. Alford, Messrs. Rogerson, Oxley, J. Wright, W. E. Smith, George Parkinson, W. H. Bailes, and R. Jaques. At the conclusion of the repast, which occupied about an hour, the children sang "God save the Queen," the Rev. C. R. Alford officiating as director The National Anthem was sung with the band accompaniment Then followed tremendous cheers from the children, when made the very walls of the room reverberate several times; and in the midst of this outburst of enthusiasm most of the company departed, and soon afterwards the festival terminated.

IMPROVEMENT OF IRELAND.

Our readers are aware that there exists in England a number of freehold land societies, originally formed with a view of enabling the inhabitants of the towns to acquire as much property in land as would entitle them to a vote for counties. The plan originated, in 1844, with the Anti-Corn-Law League, and was intended to obtain political power for the agriculturists, formed by Mr. James Taylor, of Birmingham, that the plan was susceptible of a much wider application, and might be made the means of great public improvement. His idea was, that a number of persons should subscribe money, either in one sum or in weekly and monthly instalments, and when the subscriptions had accumulated sufficiently, and favourable opportunities occurred, land should be purchased in large quantities, and divided into lots, and in due proportion amongst the subscribers. To purchase land in England in small quantities is so costly, from stamps and legal restrictions, as to make it impracticable for profit, and by purchasing in large quantities, and then dividing it into small portions, it was ascertained it might be acquired at less than half the ordinary cost. The working out of this idea was much favoured by a law passed in 1846, "The Freehold Societies Act," 6 and 7 Vict. cap. 115, which gave legal encouragement and protection to societies for raising by small periodical subscriptions a fund to assist the members in obtaining a small freehold or leasehold property." This Act intended to promote building societies, given to all the societies the privileges of a corporate body, and a society *en commandite*. It enables them to sue and be sued by trustees, exempts each subscriber from any liability beyond the sum he subscribes, and grants to all the contracts, bonds, and other instruments that may exist between the members of the society, exemption from stamp duties, and enables the society, like a railway company, to enact rules and regulations, which are recognised in the courts of law and have legal force. Profiting by this Act, the freehold and societies have become numerous; they are now establishing in many of our towns, and number not less than 30,000 members, who have already subscribed £600,000. When the present plan, now in operation, is completed, will be worth a million sterling. The freehold land scheme, from being intended merely to procure a few votes in counties for townspeople, to balance the influence of large landowners, has entirely changed the whole theory of land, establishing a small independent proprietary in England, and is effecting a great social alteration.

The success and rapid extension of the scheme in England has induced several gentlemen to introduce it into Ireland. Steps are already taken to establish a freehold land society, or society of small proprietors, in Ireland, and to carry out there on an extensive scale the purchase of estates, and the distribution of them into small lots. The occasion is propitious: the sale of land under the Encumbered Estates Act is a favourable opportunity for acquiring land with an unexceptionable title. Numerous bodies of peasantry are still preparing to emigrate, who would, no doubt, prefer to remain and cultivate land, could it be obtained on easy terms in their own country. They have funds, which would be better appealed to their native soil than to paying a passage to the United States, and established arrangements exist in Ireland for the formation of "The Small Proprietors' Society of Ireland," that more money belonging to the Irish is lying as deposits in friendly societies and savings-banks, than would purchase the fee simple of several counties. Of £3,000,000 sterling in the latter, having been saved by the large majority are said to be farmers. The depositors in savings-banks are necessarily persons of small means. On the whole, it is estimated that these various deposits, a great part of which might be made available for converting the peasantry of Ireland by the farms at will, into small proprietors, do not amount to less than £40,000,000. The Irish have within themselves the means of improving their condition, and making themselves prosperous, and their country honourable and dignified, if they knew how to apply them. The "propose" to establish a small proprietors' society will put them in the way of applying their resources at home. The Irish character is not, however, to be local, like the English freehold societies, but national. "The Irish societies," it is said, "must alot land by the acre for agricultural purposes, at stated rates, and for the money necessary for so large an object would accumulate so slowly in a local society, that the essential benefit of the system would necessarily be lost." "Each county is to have a branch committee, elected by the local members to superintend the interests; while a general directory, chosen by all the members, must keep the whole system in harmony." With this exception, which, we fear, will be a more formidable objection to the society than the projectors suppose, the Irish society is to be formed on the basis of our freehold land societies. It addresses itself mainly to farmers likely to leave the country without its assistance, but it is open to everybody who has money and inclination to subscribe. The shares are to be £100 each, payable to the amount in weekly instalments of £1, or by proportionate quarterly or half yearly payments. As fast as funds are obtained, land will be purchased and divided. The aim of the society will be to make authority over the land subservient to the creation of an "independent yeomanry;" and it is supposed that from one share to two shares at the present price of land, or from £100 to £200, will form half an acre, a small property, one fitted to satisfy the expectations of the independent. In the "proposal," the whole details of the plan are well wrought out; and the promoters of any "its very small test operation will effect some practical good; its full and complete development would not leave a workhouse or a waste in Ireland."

We have placed before our [illegible] this scheme, as we [illegible]

[illegible] Prospects," by Vincent Scale[illegible]

[illegible] Establishing a Small Proprietary S[illegible]

[illegible] does not exactly tally with theirs. The e[illegible]

TOWN TALK AND TABLE TALK.

So California has a rival. Great Britain possesses a golden territory as well as the States. The Far East turns out to be as rich, if not richer, than the Far West; and, if all tales be true, we may shortly expect to see a diversion of the stream of adventurous emigration from the route by cold Cape Horn, to the route by warm Cape of Good Hope. Odd, that we should for many years have been pouring forth the scum of our society upon what seems likely to turn out the most auriferous of our possessions. Never was there a clearer case of—

Fortunati nimium convicta *si sua bona norint.*

"The sentence of the court is, that you be transported beyond the seas for the term of the natural consequences of your dog's being found carried off, and that you be [illegible] to such place, house upon a region, where, according to the best information and advice, you have only to get on your knees, take up the mould a little, pour it from hand to hand, blow away the dust, and behold the sparkling precious metal glistening between your dirty fingers. Why, if the true state of the case had been known, juries would have rushed impetuously into the dock, and prayed to be allowed to take the culprit's position; the bar, with a horrid vision of the County Courts before their eyes, would to a man have left their country—I am far from saying, for their country's good, but for their own; while, instead of condemning criminals to be carried across the Southern Ocean, to Tom Tiddler's ground, where people pick up gold and silver, we would have ruthlessly sentenced the rascals to remain at home. Well, it remains to be seen what may be the real value of the account just received. They have certainly an authentic appearance, and will, if they be confirmed, fling a new and tempting bait before doubting emigrants. The fleece was the old riches of Australian land; but now the fleece to be pursued will be of the same material as that hunted after by adventurous Captain Jason. May the new Argonauts meet with as much success as the old ones, and not half so much peril!

I heard the other day, recounted by an eye-witness, an odd scene which lately took place in a druggist's shop in one of the towns on the southern coast. A person entered the shop, and hurriedly demanded an ounce of laudanum. His dress was disordered, his address confused and bewildered, his hair tumbled wildly, and his face pale and haggard. The shopman refused to serve him. The man pleaded hard for the drug, asked in a jeering way whether they thought he intended to poison himself, affirmed that he was well known to the master of the shop, and had only got into the habit of using laudanum medicinally. The result was, that, after some parley and hesitation, the phial was handed to him, and in an instant, and before he could be interfered with, he gulped down the whole contents. The bystanders stared aghast, while the salesman, falling on his knees in the middle of the shop, began, in a loud voice, to pray for forgiveness for the sin of self-destruction, and to declare that his disgust with the world was so great as absolutely to prevent his living in it. Meantime, the spectators would have interfered in more energetic fashions somewhat nearer, but a significant glance from the shopman restrained them. The man was allowed to finish his prayer, which was very long and very rambling; but, while still upon his knees, and apparently waiting calmly for the action of the drug, the shopman coolly asked him if he knew what he had taken. The would-be suicide in very high price—fetched the sum of £6 13s. Such monster specimens as these are now becoming very rare: but most old Scotch fishermen are full of old legends of the enormous salmon which, in days of yore, before the introduction of stake-nets along the estuaries of rivers, used to haunt the mouths of streams; and hardly a good angling river in the North but has its tradition of some one vast fish captured by the rod, after, perhaps, a contest of days and nights between the fisher and his prey. These more or less apocryphyal salmon are often described as having been from 70 lb. to 80 lb. in weight; and the great difficulty experienced by the angler, after he had got his victim well, and more from their activity or their struggles, but from their sullen inactivity, setting down to some dark pool, and refusing to move or to yield—not only to the jerks of the line, but to showers of stones rained upon them, or even the poking of the line's butt end. I have heard of instances of boys being set to dive after the big fish before he could be got into motion; but, in a tolerable experience of the vicissitudes of salmon angling, I never saw a fish so sullen or so anti-peripatetic as to require the application of stones to make him swell, and move his great stone flung into the pool in which he had taken refuge. The best sport is, however, invariably shown by salmon or grilse weighing less than 10 lb. Many a Mr. Briggs have I met upon the rocky and gravelly banks of a Highland river, got up in the most approved style of sporting dandyism known to London tailors, and with a rod which almost dazzled you to look at; it was so bright with brass and varnish, and all manner of cunning workmanship, the inventions of Oxford or Regent-streets. Our friend would look with desperate contempt upon the gear patronised by the Highland gillie—the barbarous ashen stem, and a tough hickory or lance-wood top, the two united by means of a long splice and a stout bit of whip cord. But, alas! for the vanity of glancing brass and gleaming varnish, how often did it happen that in the first rush of excitement, and flounder of a heavy fish, our spruce and dandy gamecracker at one or other of its dozen joints, off went the liberated fish the instant the strain of the line was slackened, and there stood Mr. Briggs, the runs of his rod in his hand, the very picture of Lord Ullin when "he was left lamenting."

A small wrinkle for Continental travellers. If you design to make your trip a tolerably long one, and go over Austrian and Italian ground, a passport signed by the Lord Provost of Edinburgh (and which, I presume, can easily be procured) is said to have quite wonderful effects. Returning from the Frith of Forth" is one of the smallest, but not the least used all over Europe with a passport of his civic chief, and that, in the attention shown to him, and the awe it inspired, it beat the Foreign Secretary's small attempts at rivalry, to say nothing of the rack of Austrian passports, consuls, and all the rest of the thing. My acquaintance showed me the document, which I can bound to say had a most majestic appearance. It seems that the municipal head of "Auld Reekie" rejoices in a vast multiplicity of obsolete titles. Lord High Admiral of the Frith of Forth" is one of the smallest, but all of which are stated at most imposing length in the passport, the effect being to inspire all manner of frontier officials with a deep and pervading awe for this dreadful potentate, and a corresponding degree of civility towards the lucky personages who have with them the most imperial mandate. Add to these characteristics, a number of vast seals of antique and venerable aspect, and nearly as big as saucers, and the charm is complete. *Dowagers* and *gendarmerie* touch their hats and do solemn reverence to the Lord Provost, before they condescend to pay any attention to the inferior race of travellers, finished merely with the vocabulary of a Secretary of State. Perhaps, in the present disturbed and unsettled state of frontier regulation, in the cases of many of the southern nations, a couple of passports, from the Secretary of State and the northern potentate, might, occasionally, be found convenient.

Since the *America*'s achievement, yachts are to be had cheap It has even been stated that property of this description has fallen 10 per cent.—every yacht proprietor who can afford it being anxious either to have his craft altered to as near the lines of the Yankee schooner as possible, or to sell it and build another upon the improved principle. A good look-out this, at all events for the yacht builders. Our sail making, too, must, by all accounts, be reformed. For years back, we have been going on improving the build of our vessel to be carried, without paying any heed to the lessening of the surface opposed to the wind, and necessitating the removal of a corresponding bulk of fluid. The *Alarm* cutter carries 1200 square yards of canvas in her mainsail, a most hugely unmanageable web, while the outrageous size to which gaff topsails and balloon jibs have recently grown, is one of the causes why the vessel *solent-ibus* through the water when only slight summer airs are abroad, but totally useless for a stiff breeze and a head sea, and necessitating an absurdly exaggerated size of masts and spars; all this much, and how lightly will the wind, and its fitful gusts played on a more proper footing. Schooners are far more easily handled, and pleasant craft, both to look at and to sail in, than cutters; but in point of speed the former were never understood to have a chance with the latter, just because the cutter carried proportionally a greater expanse of canvass than the two-masted vessel. The *America*, however, has done us good service in proving the capabilities of a schooner when properly built and rigged. I hear that her lines are the ordinary ones in use among the sailing schooners and pilot-boats brigs, which we have been chasing and occasionally capturing any time this thirty years, about the mouths of the African rivers, but from which we have never yet had wit enough to take a lesson. A. B. R.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

On Saturday last the necessary preliminaries and conditions were arranged and finally agreed upon, by which Commodore Stevens transferred the *America* to Captain De Blaquiere, of the Indian army, for the sum of £170 0 which sum he becomes her sole and undivided possessor, and will, it is stated, at once proceed with her on a voyage of pleasure to the Mediterranean.

The commissioners appointed under the Act of last session to inquire into the practices of elections in the borough of St. Albans, Messrs. Bruce, Forsyth, and Kay, have appointed Mr. J. H. Fitzgerald, of the Western Circuit, as their clerk for the conduct of this inquiry, which they have fixed to commence at St. Albans towards the middle of October. The Mayor and corporation have placed the guildhall at their disposal, and proffered every assistance in the conduct of the investigation.

From the General Post-office, orders have been issued that the undermen lioned offices be opened as money-order offices on the following days; viz. on the 1st September: Leyburn, Yorkshire. 8 h September: Farnham, Kent; Princess Risborough, Buckinghamshire; Tenale, Berkshire; Wye, Kent. Thorp Arch, Yorkshire, is inserted in the list for July last, should be denominated as Boston Spa, Yorkshire

The Commissioners of Customs have issued directions to the collectors and comptrollers of the several ports of the United Kingdom to prevent and transmit to the Comptroller-General a return of expenses incurred at their re pective ports under the Steam Navigation Acts, 9 and 10 Vict., cap. 100; and 14 Vict., cap. 81; and the Passengers Acts, 12 and 13 Vict., cap. 33; and 14 Vict., cap. 1.

At the British Museum, the early closing hours of the autumnal season began on Monday. The doors are opened to the public daily (except on Saturday) from ten to five o'clock until the end of September, when the establishment will be closed for the annual cleaning, and afterwards only open on Monday, Wednesday, and Friday, to four o'clock.

Between six and seven o'clock on Saturday morning, a fire, attended with great destruction of property, broke out in the Dapford Tar and Naphtha Works, situate near the Creek. The flames originated, from some cause not clearly ascertained, in a range of timber buildings, about 30 feet wide by 40 feet in length, and, owing to the inflammable nature of the contents, soon reached the five more extensive buildings presented an immense sheet of flame, and before any attempt could be made to extinguish the flames, they had communicated with another building, in which a valuable assortment of goods was destroyed. The manager of the works estimates the stock in trade destroyed as being worth £800 or £1000.

On Monday, the factory of Mr. Lever, Wigan, was destroyed by fire, the cause of which is supposed to be accidental.

An explosion of fire-damp took place in Rose Bridge Colliery, Ince, the property of Messrs. Cass an Morris, on Saturday morning last, the result of which was, that a boy, about fourteen years of age, named Thomas Lowe, died the same evening from the injuries he then received.

On Saturday the registration lists of claims and objections to borough and county votes were published. In the metropolitan boroughs there are not more than 50 claimants and objections. The claims and objections for the county are only numerous. In the city of London there are on the livery list 214 objections, and only two claims. In the parish lists the claims and objections are also numerous.

The parochial authorities of St. Clement Danes have at length bestirred themselves for the suppression of the vile and blasphemous print-shops in Holywell-street, and on Saturday morning a party to adopt means to bring about their removal, and the removal of the colony of thieves and infamous characters in Newcastle-court.

The municipality of Dijon, in imitation of that of Paris, has resolved to undertake important works, in order to afford employment to the workmen. Amongst other things, it has resolved to effect a complete restoration of the old palace of the States of Burgundy, at an expense of 350,000f. The plans have already been submitted to the Minister of the Interior.

Captain Garrett, of the 16th Regiment, now in Preston garrison, having made a wager with the officers of that corps that he would walk to Liverpool and back (forty miles) in 24 hours, set accordingly started from Fulwood Barracks precisely at eight o'clock on Sunday evening last. The whole of the day was wet and stormy, and it continued to rain heavily until he got as far as Ormskirk at night. However, he maintained his pace, and he returned to the barracks in good spirits. The following day, at a quarter to seven o'clock P.M., having taken 23 hours and three quarters only to perform the turn.

From Naples, accounts of the 21st ult. announce that the small town of Bari, on the Neapolitan coast, had been completely destroyed by an earthquake. All the houses, with one or two exceptions, were ruined by an earthquake. All the houses, with one or two exceptions, were ruined by an earthquake. 700 dead bodies had been dug out of the ruins. At Sorrento a violent shock was felt on the 14th, and in several other parts of the province of Basilicata. Many houses were thrown down, and even whole villages have been transformed into heaps of ruins, and many lives lost. The people are panic-struck, fearing a repetition of the calamitous earthquakes of 1783, which were repeated during a period of nine months.

The news from Mexico this week states that the old system of banditti has been revived through the country. Travelling is consequently unsafe to travel armed bands at least twice a week, rendering it exceedingly unsafe to travel with valuables or money. Americans and English men, it is said, are seldom molested, more through fear than any love or respect the robbers have for them.

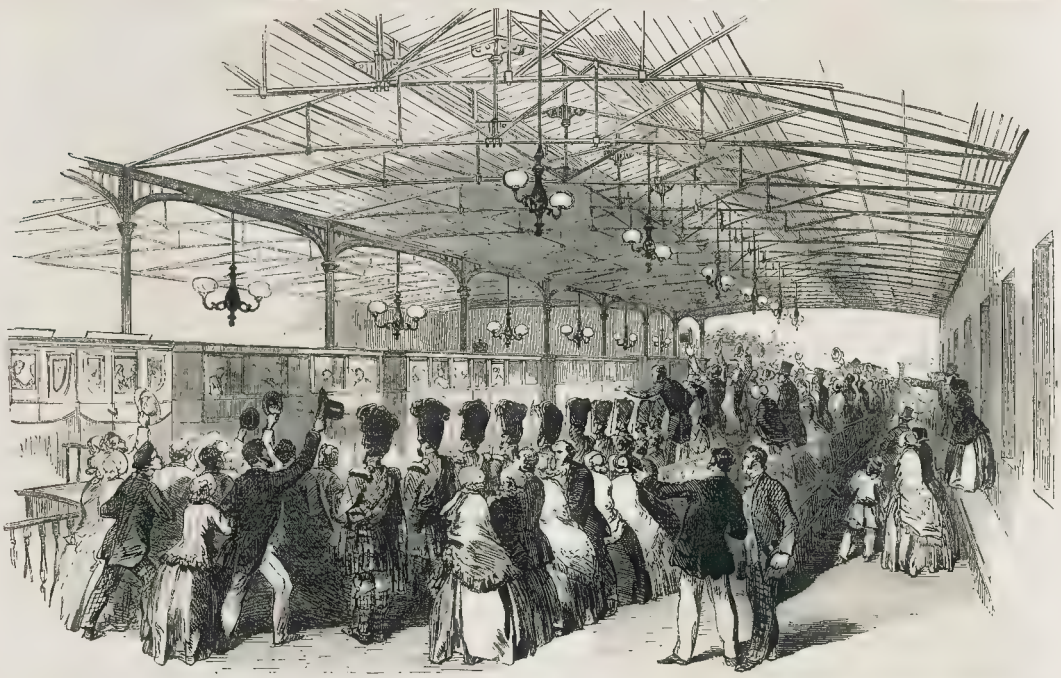
Great loss of life and destruction of property occurred at Muscatine, Iowa (United States), on the 11th ult., by a freshet on a creek, which occurred at night. Houses were swept off, and in one a woman and her three children were drowned. The loss to public works alone is 10,000 dollars.

Dominick Daly, Esq., formerly Government Secretary and Member of Council in Canada, is appointed Lieutenant-Governor of Tobago, in the room of D. B. Ross, Esq., deceased.

Messrs. R. Duncan Wilmot, John Hamilton Gray, and George Hayward are appointed members of the Executive Council of New Brunswick.

Most of her Maj sty's Ministers are at present absent from London. Lord John Russell is with the Queen at Balmoral. Sir Charles Wood is fishing in an Admiralty yacht. The Chancellor of the Exchequer is at his country seat, as is Lord Grey. The Lord President and Sir Francis Baring are only in town occasionally for a day. Mr. Labouchere has gone to Scotland again, and the other members of the Administration are away. But for the presence of Sir Fabrice, London might almost be said to be without a Government.

The merchants of Richmond, Virginia (U. S.), are about getting up a regular line of steamers between that port and Liverpool. In New York a line of steamers between that port and Liverpool. In New York a line of steamers between that port and Liverpool. In New York a



HER MAJESTY AT THE PERTH STATION.

THE QUEEN'S VISIT TO THE NORTH.

(*Continued from page 282.*)

by her Royal Consort and the two elder children. The junior members of the Royal family, the Premier, and the Royal suite then took their seats in the train.

The train consisted of eight carriages and three trucks. Mr. Paton, superintendent of locomotives, guided the engine of the Royal train, which was tastefully decorated with flowers and evergreens.

All being prepared, the train left the station at about fifteen minutes past eight, when a cheer burst forth from the spectators.

The Royal train reached Linlithgow at 8 52, where the engine stopped for a few seconds to take in water. At Polmont, the train left the Edinburgh and Glasgow line, and proceeded by the Stirlingshire Midland Railway Junction to Larbert. At the Larbert Junction, the engine was replaced by one belonging to the Scottish Central Railway Company, and several of the directors of that line were here in waiting to accompany the Royal party to Perth. At half-past nine the Royal carriages reached the Perth station, the soldiers of the 79th Cameronian Highlanders lining both sides of the railway; the band played the Queen's Anthem while the Royal party was passing, and a Royal salute was pealed from the guns of Stirling Castle. The magistrates, council, and constabulary were in attendance, as also a great concourse of spectators; but a momentary glimpse only of her Majesty or any of the Royal party could be obtained.

PERTH.

The railway platform was occupied by the portion of the 79th Highlanders at present in Perth, under the command of Captain Harrison; the high constables were also out, and the magistrates and other authorities took their station upon the platform, where there could not be fewer than 1500 or 2000 well-dressed ladies and gentlemen. About twenty minutes after ten the Royal train entered the station amidst the applauding shouts of the multitude. The Royal carriages drew up opposite the platform, and her Majesty politely exchanged salutations with the Lord Provost. During the time the train remained, which did not exceed two minutes, her Majesty stood near the door of the carriage with the Prince on her left hand, along with two of the Royal children, and acknowledged the cheers with which she was greeted.

After several of the directors of the Scottish Midland Railway, who were to accompany the Royal train to the termination of their jurisdiction, had taken their seats, the carriages again drove off.

STONEHAVEN.

The railway station (as on a former occasion) was fitted temporarily as a suite of apartments for the Royal family. A lunch, laid in the most elegant style, was prepared by Mr. Douglas, of the Douglas Hotel, Aberdeen.

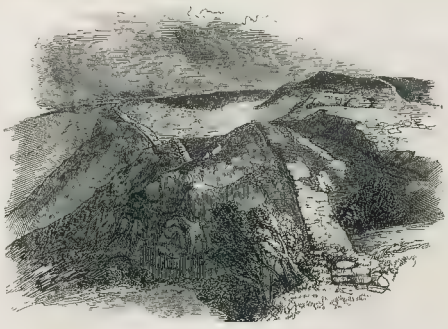
In the neighbourhood of the station, and just across the line, was erected a magnificent triumphal arch of evergreens, flowers, &c., and on every eminence and from many of the houses around flags and banners were displayed. The morning trains brought a considerable number of visitors from Aberdeen and the south, and the inhabitants of Stonehaven turned out in crowds.

At a quarter before one, the carriages drove up, in the same order as that in which they had left Edinburgh. Mr. Pirie, deputy chairman of the directors, Clements Lumsden, Esq., Major Christie, and Mr. Wallace, accompanied the train from Forfar; and Mr. Thompson, of Banchory, Mr. Davison, of Inchmarlo, Mr. Bervie, and Mr. Gibson, were on the platform here to receive her Majesty, who, on alighting, was received with loud cheers.

Her Majesty remained at the station half an hour, partaking, along with the rest of the Royal family, of luncheon. The suite had refreshment in the second dining room. At twenty minutes past one o'clock the Royal party left for Banchory. Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal occupied the first carriage; the second contained the two other Royal children, and immediately behind came a *char-a-banc* with Lord John Russell, Colonel Gordon, Colonel Phipps, and Sir James Clark. On their departure they were saluted with loud cheers.

The first stage of 15 miles brought the Royal party to Banchory, by the Dee side, where they changed horses at the Burnet Arms Inn. The course of the river was then followed by Aboyne and Ballater, at both of which places relays of horses were in readiness. At Ballater the river was crossed, the Royal party proceeding thenceforward by the south bank of the Dee to Balmoral, where her Majesty arrived quite safely about half-past seven o'clock.

DEPARTURE OF HER MAJESTY FROM STONEHAVEN.



WALL OF SEVERUS, WALLTOWN CRAGS, NEAR THIRLWALL.

NOOKS AND CORNERS OF OLD ENGLAND.

REMAINS OF THE WALL OF SEVERUS, WALLTOWN CRAGS, CUMBERLAND.

The noble design of his Grace the Duke of Northumberland, comprising an extensive examination of this ancient barrier of Northern Britain, and a liberal invitation to the body of antiquaries to take part in the proposed investigation, has created a revived interest in a subject which, from time to time, has engaged the attention and research of some of our ablest topographers and archæologists.

REMAINS OF THE STATION CALLED MAGNA, CAERVORAN.

The remains of this colossal monument erected by the energy of our Roman fathers, to whom we owe the foundation of our laws and civic institutions, appeal in a manner somewhat more touching than belongs to the common interest of historical association, when looked upon as a parting memorial bequeathed by the friendly conquerors at a time when the exigences of the Roman State demanded the recall of those legions whose prowess had sufficed to protect the Britons from the savage tribes of the Scots and Picts who threatened them from the fastnesses of the north.

The largest surviving feature of the famous wall is that portion of it which crowns the serrated edge of Walltown Crags, near Thirlwall Castle. This part is locally called the Nine Nicks of Thirlwall. It presents a scene of peculiarly wild and picturesque ruggedness; and the Wall at the highest part is upwards of eight feet in height, its thickness being nine feet, presenting to the north as many as twelve courses of facing stones.

The house of Walltown is celebrated as having belonged to the Ridley family, and was the residence of John, the brother of the martyr Bishop Ridley.

A well, near the line of the Wall, which has formerly been enclosed with masonry, is called Arthur's Well; and is said to have been the spring in which Paulinus baptized King Ecfrid on his conversion to Christianity.

At Caervoran, an eminence retaining its British name, lying off the south side of the Wall and the vallum, which is conspicuous along the line of the Wall at Walltown, are the remains of the station called Magna, supposed to have been one of the forts erected by Agricola, previous to the Wall; and of the vallum, the fragment which remains visible is a part of the northern rampart of the station, which covered an area of four acres and a half, and appears from its space and position to have been a point of considerable importance.

The view from this eminence extends from the base of the crags, over a waste of peat moss, which in earlier times formed part of the debateable land on the English border, the range of Crossfell and Skiddaw appearing in the distance.

The height of the Wall at Walltown Crags was a subject of correspondence between Sir Walter Scott and the Rev. Mr. Hodgson, author of a history of Northumberland. In the course of this, the former, conceiving he had obtained but an indefinite reply to his enquiry, wrote to ask if the Wall was high enough for a man to break his neck from it; to which his correspondent replied, that he certainly considered that it might be so, especially if, in taking the leap, he should include the cliff at its base, which would add some hundreds of feet to the probability of such a result. The view from the heights extends from the bases of the crags over a waste of moss land, Skiddaw and the range of Crossfell appearing in the distance.

MISS CATHERINE HAYES.—FROM A PORTRAIT BY A. SALOMÉ.

MISS CATHERINE HAYES.

Miss Catherine Hayes left Liverpool, for New York, on Wednesday last, to make a tour in the United States. This gifted vocalist whose Portrait is presented by our Artists, was born in Limerick. At an early age her beautiful voice won for her the patronage of the late Hon. and Right Rev. Edmund Knox, Bishop of Limerick. In Dublin, Signor Antonio Sapio was the first singing-master of Miss Hayes, in 1841; and her first appearance in public took place at his annual concert in the great room of the Rotundo. In December of that year she sang, at the concert of the Anacreontic Society, "Qui la voce," from Bellini's "Puritani," and "Come per serena," from the "Sonnambula." Liszt, the celebrated pianist, heard her at a concert in January, 1843, and was so struck with her singing that he wrote to the Bishop of Limerick's daughter-in-law thus:—"I do not know of any voice more expressive than that of Miss Hayes. I doubt if, amongst the singers of the day, there is one equal in extent and volume to what hers will be." During 1843, Miss Catherine Hayes continued to be one of the leading singers of the Anacreontic Philharmonic, and other powerful concerts in Dublin. Labiache and Costa heard her at the close of this year, and expressed high opinions of her

MEMORIAL BUST OF RICHARD HOOKER, IN THE TEMPLE CHURCH. (SEE NEXT PAGE.)

"THE BATEMAN CHILDREN," AT ST. JAMES'S THEATRE.—(SEE NEXT PAGE.)

musical abilities. It was on hearing Grisi and Mario in "Norma," in this year, that Miss Catherine Hayes first experienced the desire to go on the lyric stage; and, after considerable opposition from her relatives and friends, she went to Paris in October, 1844, to study under Manuel Garcia (brother of Malibran and Viardot, and master of Jenny Lind), who, after a tuition of a year and a half, advised her to proceed to Italy, in order to obtain the best experience for the stage. At Milan she became a pupil of Signor Felice Ronconi, brother of the great Giuseppi Ronconi; and, through the kind intervention of the once famed Mdme Grassini (Grisi's aunt), she was engaged for the Italian Opera-house in Marseilles, where she made her first appearance on any stage, on the 10th of May, 1845, as *Elvira*, in Bellini's "Puritani." She subsequently appeared in *Lucia*, and in Rossini's "Mosè in Egitto" (*Zoroè*). After her return to Milan, she continued her studies under Felice Ronconi, until Morelli, the director of the Scala, offered her an engagement. Her first character was *Linda*. She was recalled twelve times by the audience. Her next part was *Desdemona*, in Rossini's "Otello," her performance of which earned for her the title of "the Pearl of the Scala." In the spring of 1846, she sang at the Italian Opera in Vienna; and at the Carnival of 1846-47, was engaged at Venice: two new operas were composed for her, "Griselda," by Federico Ricci, and "Albergo de Romana," by Malepsino. After a second season in Vienna, where Ricci wrote his "Estella" for her, and she also appeared in *Norma*. Miss C. Hayes then visited Bergamo, Verona, Florence, and Genoa, enacting *Maria di Rohan*, and the leading parts in Verdi's works, with distinguished success. Rubini and Mercadante the composer, and the late Madame Catalani, expressed the highest admiration of Miss C. Hayes's talents. After the termination of her engagement at the Carlo Felice, in Genoa, Miss Catherine Hayes was offered *carte blanche* for London, both by Mr. Lumley for Her Majesty's Theatre, and Mr. Delafield for the Royal Italian Opera.

She appeared at Covent-garden Theatre, the 10th of April, 1849, as *Linda*, and afterwards as *Lucia*, and sang at the private concert at Buckingham Palace in the presence of Her Majesty and, minutely congratulating her on "her deserved success." In November, 1849, she made her return to her native land, and created an immense sensation at the Dublin Philharmonic Society and Theatre Royal, playing as *Lucia*, *Norma*, *Amina*; and she visited Liverpool and Glasgow, with the *prima donna* of the Italian Company, where she received a truly Irish welcome in each city. Having been engaged by Mr. Lumley for the season 1850, she made her *début* on the 2nd of April, in *Lucia*. In the winter of 1850-51, Miss Catherine Hayes made another provincial tour in Ireland and the English provinces, particularly at Manchester, Liverpool, Birmingham, &c. At the grand Carnival of Rome in 1851, Miss Catherine Hayes was engaged at Rome, at the Apollo Theatre, closing the round of her *répertoire* in *Maria di Rohan* which part she had sustained for twelve successive nights. During the season 1851 Miss Catherine Hayes has been the star of the concert-room in London, and of the performances at the Sacred Harmonic Society, where her singing in the sublime oratorios of Handel, Haydn, and Mendelssohn has won universal admiration. On the 26th of May, Miss Catherine Hayes gave a morning concert at the Hanover Rooms, at which her vocalisation in every school made a profound impression on the audience. After a visit to Trouville and Havre, in July and August, Miss Catherine Hayes returned to England, to sing at farewell concerts at Manchester and Liverpool, from the 28th of August to the 1st of September, her final appearance being at the Theatre Royal, Liverpool.

The voice of Miss Catherine Hayes is of extraordinary compass: in the air of *Fidès*, from Meyerbeer's "Prophète," she descends to the low notes of the contralto register, after attacking the most elevated soprano tones. Miss Hayes's singing this season, in sacred music and in mis cellaneous concerts, has raised her reputation immensely. If the ballad school be in such ascendancy with the American amateurs as it is stated to be, Miss Catherine Hayes bids fair to enjoy the highest popularity—for a more eloquent exponent of the melodies of her own land was never heard.

MEMORIAL OF RICHARD HOOKER, IN THE TEMPLE CHURCH.

THE numerous visitors to this celebrated church—architecturally and historically one of the most attractive ecclesiastical edifices of the metropolis—will do well to notice a fine memorial bust of Richard Hooker, which has just been placed at the south-west angle of the choir, by the Hon Society of the Middle Temple, in memory of this learned and judicious Hooker, author of the "Ecclesia-tical Polity," and six years Master of the Temple. Izaak Walton describes the appointment as a "place" which Hooker "accepted, rather than desired." Travers, a disciple of Cartwright, the Nonconformist, read lectures; and Hooker, by his own avowal, preached Calvinistic doctrines in the forenoon, and Travers Geneva in the afternoon. The Benchers were divided; and Travers being first silenced by the Archbishop, Hooker resigned; and, in his quiet parsonage of Boscombe, renewed the contest in print in his "Ecclesiastical Polity." (See Cunningham's "Modern Eminent Men.")

Hooker was subsequently presented to the living of Bishopsbourne, in Kent, where he died, and was interred in the church; and a monument was afterwards erected to his memory by Sir William Cowper.

The bust, which is engraved upon this prospective page, is ably executed, and the features are highly characteristic of Hooker's habitual gravity, mildness, and moderation. The sculptor of this memorial is Mr. Gatley, who has also executed a successful likeness of his Grace the Archbishop of Canterbury, for Lambeth Palace. We are glad to find the Hon. Society of the Inner Temple have expressed their approbation of his bust of the "judicious Hooker," by generously rewarding the artist beyond his commission.

Mr. Gatley, we believe, is a native of Cheshire; and, during his early career in art, was introduced to the studio of Bailey by the late Dr. Stanley, Bishop of Norwich; after which, he found employment in that of the late Mr. Watson, and has since been engaged on commissions for several distinguished gentlemen in the counties of Chester and Lancaster

THE LONDON AND NORTH-WESTERN, MIDLAND, AND GREAT NORTHERN RAILWAYS.—Mr. Gladstone, to whom the question of the division, between the above companies, of the traffic between London and the towns of Leeds, Wakefield, Sheffield, Doncaster, and Lincoln, was referred, has made his award. We understand the substance of the award to be as follows:—Assuming the through traffic between the places referred to remains the same, the Great Northern are in the passenger receipts to take 460 parts, and the London and North-Western and Midland 140 parts; and of the goods receipts the Great Northern are to take 360, and the London and North-Western and Midland 240 parts.

THE OTHER SIDE OF THE PICTURE.—The Boston *Gazette* speaks of witnessing the effect of several sharp showers upon the new costume. The Turkish trowsers lost their graceful contour, and flagged round the pedestals of the warriors, like a banner round a flag-staff, while the tunic was deprived of its stiffness

The *Giornale di Roma* gives an account of a most singular meteor which appeared on the 18th ult. after sunset, in the vicinity of Velletri, Appinines and the Alban Mountains. The phenomenon was ushered in by sudden flashes of light, shooting from two distinct points of the eastern horizon behind the Monte di Montagnone, near Monte Fortino. The light at its height greatly resembled that of the *aurora borealis*. After some time, a splendid fiery globe, apparently as large as the moon, whom seen at the horizon, rose to the altitude of about 30 degrees. From the rose-coloured light it cast upon the adjoining clouds, it was evidently above them. It continued its course, describing so striking like a pendulum, from west to east, for some time, and at last burst with the noise of thunder, scattering thousands of luminous fragments around, which soon disappeared. The phenomenon had been preceded by several falling stars in the same quarter of the heavens.

THE CRIMINAL LAW.—On Monday Lord Campbell's new act on the administration of the criminal law came into operation. By this act criminal courts can order indictments, &c., to be amended where the variances are not material to the merits of the case. In indictments for murder or manslaughter, the means by which the injury was inflicted need not be specified, and in cases of forgery and getting property by false pretences, it will be sufficient to allege that the act was done to defraud, without stating any particular person. A person indicted for felony may be tried and guilty of a misdemeanour; and in an indictment for a misdemeanour which turns out to be a felony, the court may order another indictment. By this act, the section in the 17th William 4 and 1 Vict. which allowed the prisoner himself to be found guilty of an assault, is repealed, in consequence of the great difficulties which have arisen (as in the remarkable case of the Birds) in the construction of the enactment. There is a provision in this act authorising any court, judge, or justice, including Bankruptcy and Insolvency and County Courts, to commit and order a prosecution for perjury. Among the improvements created by this act is one adding courts, on conviction, for certain misdemeanours, such as conspiracy, in recent assaults, &c. to add hard labour in the discretion for the whole or part of the time. The act (14 and 15 Vict., cap. 100), extends to all parts of the United Kingdom, with the exception of Scotland.

In Beyrout, *les Sœurs de la Charité* have established a day-school for young ladies, and a day-school for poor girls and Arabs. They also set up an hospital, where soldiers attacked by fever or any other disease are kindly nursed and cared for, and the two best doctors at Beyrout attend them.

THE ILLUSTRATED LONDON NEWS.

MUSIC.

FAREWELL CONCERTS AT MANCHESTER AND LIVERPOOL OF MISS CATHERINE HAYES.

(From our own Correspondent.)

MANCHESTER, August 31.

Upwards of 9000 persons have attended the three farewell concerts of Miss Catherine Hayes at the Free-Trade Hall, on Thursday, Friday, and Saturday, and hautstated as I have been to the enthusiasm of audiences in many countries, rarely do I recollect a greater impression to have been produced by the vocalisation of any *artist* than by the "Swan of Erin." At the first concert, she was encored in "Ah! non fia," from Meyerbeer's "Prophète," in Wallace's ballad, "Why do I weep for thee?" in the "Sonnambula" *finale*, "Ah! non giunge;" and in "Eathleen mavourneen." At the second concert, she was recalled after "Casta Diva," from Bellini's "Norma," and encored in Lavenu's graceful ballad, "Those happy days are gone," in Donizetti's polacca from "Linda," "Oh, luce di quest' anima," and in Knight's ballad, "The Grecian Daughter, substituting for the latter "Bonnie Prince Charlie" the second time. At the third concert the encores were for "Ah! non fia" (sung again by general desire, as also "Kathleen mavourneen.") On returning after the demand for the repetition of the last-mentioned air, Miss Katherine Hayes gave the "Ah! non giunge." The last piece rendered by Miss Hayes was Lavenu's *finale*, "Ah! non giunge," from "Maria di Rohan," at the end of which a most exciting scene was witnessed, the assemblage of upwards of 3000 persons recalling Miss Hayes, and giving her a tremendous ovation as a farewell from Manchester. I never heard this gifted vocalist in finer voice; her improvement, since she sang at the two Italian Opera-houses, is quite surprising; it is no longer the timid vocalist, but the thoroughly accomplished *artiste*, capable of moving the audience by the most intensely dramatic and highly-finished style. Her ballad singing is perfection—her "Kathleen" is one of those exquisite interpretations in which the intellect and sentiment of the exponent are equally apparent. More profound pathos than she exhibited in the recitative, preceding the Cavatina, "Fidèle" (imitation of *Jean of Leyden* for the loss of his *Berta*—was never heard; whilst in the florid and sacred schools, the "Casta Diva" and "Ah! non giunge," and the soprano part in "Lift thine eyes," from Mendelssohn's "Elijah," sung with Miss Williams and Rebecca Isaacs, and re-demanded), proved the varied musical acquirements of the Hibernian songstress. The triumph of Miss C. Hayes at these farewell entertainments has been complete; the Lancashire amateurs have fully appreciated her great natural gifts and musica. skill.

The other vocalists at these concerts were Miss Williams, Miss Rebecca Isaacs, Mr. Augustus Braham, and Herr Mengis, whose reception was very hearty. The tenor, Mr. Augustus Braham, is improving rapidly; he has a magnificent voice. Mr Lavenu was the able accompanyist.

Sivori, the famed violinist, created a sensation at each concert. He played the "Clochette" of Paganini, the "Carnavale di Cuba," the "Carnaval de Vénise," and Prume's "Melancholie." and "Tremolo." He was numerically encored every time he played.

Music in Manchester is making great way. Mr. Peacock, the proprietor of the Free-Trade Hall, re-decorated the interior, last year, at an outlay of £10,000. The room is very handsome, and will hold nearly 4000 persons; but it is well adapted for sound. The decorations are by the pupils of the School of Design; the arabesques and the *renaissance* predominate, and the *ensemble* is light and effective. At the extremity of the hall is a fair transcript of Guido's "Aurora:" the trellis-work on the ceiling is pretty, and gives it the loftiness it lacked primitively. Some paintings *à la* Watteau merit enlargism. From October to Easter, every Monday, is this hall crowded to excess with the rite for the people. Start not, white kid-gloved amateur of the two Italian Opera-houses, at these prices! You will witness an attentive body of operatives, clean, if not smart in appearance, full of enthusiasm, listening with marked intelligence to the finest order of music, with the accompanyment of an organ. The tariff at these farewell concerts of Miss Hayes was, of course, at an advanced rate, but the "million people" were here by the most liberal means it is wated that such a combination of the beautiful to art their sensit veness, at a fine point of vocalisation or execution was deve oped—the r deep and brea hless attention to the music—their outbreak of rapturous admirat on at the close, put me in mind of my earliest forms. And curious was it to observe how the ear *popuh* prevailed by the majority in the encores; and, when the question of a repetition was decided in the affirmative, how charmingly the minority acquiesced in the decision the moment the *artiste* reappeared

The Gentlemen's Concerts will be ended for the season next Wednesday; Madame Sontag and Sims Reeves engaged.

There is a talk of organising some musical performance during her Majesty's visit, to enable the Queen to hear the justly celebrated Lancashire choruses

LIVERPOOL, Tuesday.

Great as was the excitement at the Manchester concerts, that last night at the Theatre Royal, as Miss C. Hayes's farewell concert, was possible, greater The house was filled to overflow—the orchestra was turned into high-priced sta s after the overflow from the boxes. On her entrance the audience rose *en masse*, and cheered for some minutes. Every time Miss Hayes came on the stage, the enthusiasm was renewed. She sang "Ah! non fia," Wallace's ballad, "Why do I weep for thee?" "Ah, non giunge," and "Kathleen Mavourneen," in each piece being vehemently encored, for the "Kathleen," she substituted "The harp that once through Tara's halls." After the melody she did the encored andutory exact the presence of the "Swan of Erin," to bestow a parting cheer; and such a cheer it was! prolonged for several minutes, one lady throwing a bouquet on the stage, which, perhaps, the most striking feature of her evidently one of those singers whose sensibility is acute under the effect of applause; she sang in a manner as she has never been heard to sing in London; the Opera, the Queen, the Duke of Devonshire, she could believe her to be the same vocalist. More daintily beautiful cadenzas were never essayed with more positive brilliancy and finish; there was one long-sustained note she executed with such power and purity, that Miss Hayes must assuredly will quit this country with the sufferages of the northern amateurs, for no *artiste* has ever created a greater *furore* by her vocalisation in Manchester and Liverpool

The remainder of the concert was filled up by Miss Williams, encored in Glück's "Che faro;" Mr. Augustus Braham, whose "Flowers of the forest," by Thompson, and "In the old chair," by Balfe, were tedmanded; Herr Mengis, and Sivori, whose "Clochette" and "Carnavale di Cuba" were rapturously received. Mr Lavenu was the accompanyist. The orchestra played the "Massaniello" and "Domanda da Cavrone" overtures most excellently—it was, however, not the Philharmonic band of this town, as may be readily guessed. The profound attention with which music is listened to here, struck me as much as at Manche

Many visitors to Miss C Hayes have arrived from various parts of Ireland and from London to bid her adieu. The Adelphi Hotel has been beslcged by her friends, and a farewell dinner will be given this day to her. The *Pacific* leaves to-morrow afternoon.

At the last concert at the beautiful Philharmonic Hall, one of the most magnificent concert rooms in the world, Mdme. Viardot and Tamberlik attracted an immense audiiory. There is not the slig test probability of a festival in St. George's Hall, for next year, as rumoured.

LIVERPOOL, Wednesday night.

At noon this day Miss Catherine Hayes and her friends went on board the tug steamer from the floating pne to the Rock Ferry, off which the *Pacific* was stationed. There are upwards of 200 passengers on board, and, curiously enough, Miss Hayes occupies the state berth prepared for Adelle, and in this gorgeous ocean palace. And by the way, the Rock-office boy's head has been enparalled. the friends of Miss Catherine Hayes quitted the *Pacific* to return to land, giving her three tremendous cheers at parting, in which the passengers joined heartily. As the tug was in motion, Miss Hayes with Mrs. and Miss Lavenu, and waving her handkerchief as long as the tug was in sight. A large party went down to the New Brighton Ferry, to catch at the Rock Light, the last glimpse of the *Pacific*, as the steamer passed with the assistance of the Welsh coast. Her Americans on board were in high glee at having Miss Heyes on board, of carrying the news of the triumphs of the *America* yacht, and, finally, of taking with them an electric despatch of this morning from London, announcing the award of the prize to Mr. Hobbs for picking the Bramah lock.

Miss C. Hayes is accompanied by Dr. Joy, the director of the tour, Mr. Augustus Braham (formerly an officer in our army, a son of the vocalist Braham and brother of the Countess of Waldegrave), Herr Mengis, the baso, and Mr. Lavenu, the composer, who will act as an accompanyist and conductor. Miss Hayes' first concert will take place on board the *Pacific*, for the benefit of the crew.

WORCESTER MUSICAL FESTIVAL.—A few lines will suffice to complete our last week's report. The total number of persons at the Cathedral performance were 4441: in 1848, 4427: the total collection has been £884: in 1848, £958. The falling off in the attendance at the evening concerts wi l cause a serious deficiency—so that the stewards will have each to pay the £40 for which he is liable; and then the guarantee fund of £600 will be found to be required, to cover the defalcation in the receipts. The Festival has, in fact, been almost exclusively supported by the county gentry, the townspeople having held aloof, very much to their discredit, leaving little or nothing even to the guarantee fund, raised by the county amateurs. The only casualty of the festival was the indisposition of Herr Formes, at the third and last concert; but he sang to the "Messiah" on the Friday morning, when 1200 persons attended, and £201 were collected. In acknowledging the polite attention of the stewards to the visitors, and the indefatigable zeal and exertions of the honorary secretary, in raising the fund of £600 which is required to cover the defalcation in the receipts. The Festival has, in fact, been almost exclusively supported by the county gentry, the townspeople having held aloof, very much to their discredit, leaving little or nothing even to the guarantee fund, raised by the county amateurs. The only casualty of the festival was the indisposition of Herr Formes, at the third and last concert; but he sang to the "Messiah" on the Friday morning, when 1200 persons attended, and £201 were collected. In acknowledging the polite attention of the stewards to the visitors, and the indefatigable zeal and exertions of the honorary secretary, in raising the fund of £600 which is required to cover the deficiency, the managers of the meetings of the Three Choirs, that the time has arrived when great changes must take place in the musical arrangements, in order to secure a more efficient *ensemble* in the orchestra. It is a part of farce, in these days, to confide the *bâton* in the hands of thoroughly inexperienced organists, there are certain works which go to a certain extent by themselves, but the task of accompanying the voices is most difficult and delicate, and the tact and taste to time art the proper colouring to oratorios and secular compositions can only be acquired by long training. Such blunders and mishaps as attended the performance of the last two concerts, are utterly destructive of the true interests of the festival, not to mention the insult to art by such a disgraceful exhibition of incompetency

SACRED HARMONIC SOCIETY.—Mendelssohn's "Elijah" is to be repeated last night at Exeter Hall, under Costa's direction.

THE THEATRES.

HER MAJESTY'S.

The success that attended the performances at 7-day-house prices last week has induced the management to give five additional nights this week. The first was on Tuesday, when "Norma," compressed into one act, was presented, with Mdlle. Cruvelli, Mdme. Giuliani, Signori Pardini, Mercuria's, and Casanova; with a selection from Mozart's "Nozze di Figaro," sustained by Mdme. Cruvelli and Signor Ferranti; the first act of "Lucrezia Borgia," with Barbieri Nini, Mdlle Ida Bertrand, Gardoni, and Lorenzo; and the "Prodigo" *divertissement* with Rosati.

On Wednesday, a portion of "Linda" was the opera, with Barbieri Nini and Mr. Sims Reeves, followed by selections from "Linda," by the sisters Cruvelli and Signor Ca zolari; ending with a *divertissement*

On Thursday, the second and third acts of "Fidelio," a Spanish romance, by Mdme. Fiorentini: "La Sctarella," by Rosati and M. Silvain; the last scene of "Anna Bolena," for Barbieri Nini; the last scene of "Lucia," for Sims Reeves; three by Mr. Parry, and by Rosati; and gleanings from the first act of "Masaniello," by Mouti and Fiorentini.

Last night was the "Sonnambula," with Sontag; the first act of "Lucia," with Barbieri Nini and Sims Reeves; "La Fee de Daschington," by Rosati; selections for Mdlle. Cruvelli, and the "Il Profico," *divertissement*.

This evening, the last of the season, Donizetti's "Figlia del Reggimento;" selections from operas for Barbieri Nini and Cruvelli, and pas by Rosati.

We shall give our summary of the season next week.

ROYAL ITALIAN OPERA.

The subscription season, which commenced Thursday, April 3, ended on Saturday night (Aug. 30) with the ninth representation of the "Huguenots," finely sustained by Grisi, Mdme. Castellan, Mdlle. Angri (who has not been sufficiently heard this season), Tamberlik, Bellaffeo, Polonini, Soldi, Marlo, and Herr Formbs. The house was crowded, the enthusiasm was great, and the recalls most fanatical, including Costa as well as the principals. The National Anthem was fervently sung, and loyally received.

The number of the *repertoire* produced this season have been "Semiramide" "Donna del Lago," "La Gazza Ladra," and "Otello," of Rossini; "Masaniello," of Auber; "Les Huguenots," "Roberto il Diavolo," "La Juive," of Meyerbeer; "Lucia," and "Maria di Rohan," "La Favorita," and "Elisir d'Amore," of Donizetti; "Der Frey-chütz," of Weber; "Norma" and "Puritani," of Bellini, and the "Don Giovanni" of Mozart. Out of five pledged new works in the prospectus, only three have been actually produced—Benedict's "Il Talismano," Mozart's "Il Flauto Magico" and Gounod's "Saffo." There has been only one morning concert this season, that of Mrs. Anderson. There have been 46 representations, 46 subscription, and 20 extra nights. Out of the sixty-six nights, twenty three were devoted to Meyerbeer's three operas, twelve to Mozart, ten to Rossini, six to Donizetti, seven to Bellini, three to Auber, one to Weber, two to Gounod, and two to Gnecco. Auber's "Enfant Prodigue," the copyright of which had been purchased by Mr. Gye of Scribe and Auber, was forestalled at Her Majesty's Theatre

The season has, at the time, since the new system of the Royal Italian Opera, the season has been prosperous, and a considerable financial benefit has been derived from the undertaking. Mr. Gye will continue to be the sole director for the season of 1852.

ST. JAMES'.—THE BATEMAN CHILDREN.

These remarkable children have this week appeared in *Sinbook* and *Portia*, in the fourth act of the "Merchant of Venice," and manifested the same extraordinary aptitude to receive instruction in histrionic points which we have already recorded. It seems to be Mr Barnum's desire to show what he calls their "versatility," and what Sir Bulwer Lytton would pronounce to be their "comprehensiveness;" but the faculty of imitation signifies a variety in the development, else it would descend to mere mimickry, in which the ape would be as capable as the child. We present this week Portraits of the two precocious marvels in question, trusting that they who have the care of them are duly impressed with a sense of the moral duty of not over-working powers so prematurely developed, and will look chiefly to the future welfare of the children, in regard to their intellectuals and capacity for art, as well as the immediate profit to be derived from their too-early exhibition of talent Prodicies they may be—and are; but they are intellectual agents as well, and a serious responsibility rests on those who have direction of them for the thorough cultivation of the mands entrusted to their safe keeping Could statistics compass it, nothing would be more wonderful than the number of wonderful children in the world. Child hood itself, indeed, is the great wonder. "Heaven lies about infancy." What admirable and mysterious powers lie unfolded in the cradle! How few of these are properly trained and developed to maturity Of these, the most facile to education are, perhaps, the histrionic. The child, as Aristotle said of old, is naturally an actor, and makes the play in which she performs. This aptitude in the case of Helen and Kate Bateman has been produced to an almost unparalleled extent. Our Portraits represent them in powerful concert, where the accompaniment of organ music suggests the appropriate sentiment.

AMERICAN DRAMATIC JUBILEE

The Yankees are resolved to go ahead in everything. In these days of dramatic excitement, our readers will be surprised to learn that the citizens of New York were, on Thursday, the 12th of August, engaged the whole day, from 10 a.m. till 12 at night, in witnessing a succession of dramatic performances in the Castle Garden, in honour of a Mr. Edielbert A. Marshall, lessee of the Broadway theatre. The monster programme comprises pieces from his company, with various troupes and companies, equestrian, histrionic, and operatic, engaged for the important occasion. The requisition to Mr. Marshall is signed by one Henry F. Quackenbos, President of the "Committee of Arrangements." To which Mr Marshall replied in appropriate terms The order of proceeding was in this wise. A grand overture, followed by the third act of "Rob Roy," in which the costume of Madame Ponisi, as *Helen Macgregor*, was much admired. Then a *pas de deux* by Mdlle. Adeline and Signor Rota, with "How to Pay the Rent," and a *pas seul*, were succeeded by one act of M. Dumas' "Kean," and the extraordinary feats of the Martinetti family. After this the company of the German National Theatre appeared on the stage, and performed the vaudeville of "Die Weibliche Schildwache." Some pause was then permitted; but at two o'clock P.M. the games recommenced with the grand Italian Opera company, under the direction of Max Maretzeck, and the first act of the opera of "Ernani," one act of "La Donna del Lago," the second act of "Lucia di Lammermoor," the fourth act of "La Favorita," and the second act of "Lucrezia Borgia." Another interval of rest was then allowed until fifteen minutes past 6 o'clock, when the grand *divertissement* of the Ronzet and Raval families exhorted admiration for feats of dancing and daring. The jubilee concluded with a magnificent display of fireworks, and an oration by the director, Peter Richings, in favour of the *beneficiaux*. Two thousand dollars, we understand, were realised by the transaction.

POLYTECHNIC INSTITUTION.—The lectures connected with the deposits in the Great Exhibition are still continued at this institution by the chemical professor, Mr. Pepper, on metals and ores. The professor commenced his discourse by quoting a high eulogium on the alchemists, who he considered, were the true fathers of this science and therefore fully entitled to our respect; more particularly as the possibility of the transmutation had been once more reversed, and was now engaging the attention of many of the ranks of science. The object of the lecture appeared to be threefold; viz. to show the chemical properties of the metals, to demonstrate chemical affinity, and to be an apology for the seeming folly of the alchemists' idea of transmutation.

EXTRAORDINARY PIANOFORTE PLAYER.—We find the following extraordinary statement in the *National*:—"Count Orloff has just presented to the Emperor of Russia an extraordinary musical phenomenon, in the person of a young Wallachian called Frederick Rolitz. This man has but two hands, each having ten fingers. He was brought up by a clergyman, who taught him to play on the organ: but the young man in the course of time found the instrument far too limited, and suddenly assumed power than that of ordinary instruments. He enjoys excellent health, and, with the exception of his hands, presents nothing strange in person. It is only from the elbow that malformation commences. The arm there divides into two limbs, each ending in a hand with a double supply of fingers. These additional arms are really made, and the only remarkable point observed by medical men is enormous development of the deltoid muscle at the summit of the shoulder. The clergyman who had brought up Rolitz on his death left him his small property, and the young man immediately purchased diamond rings, with which he loaded his twenty fingers. It was with them so adorned that he performed before the Emperor of Russia, who expressed his surprise at the musical powers of the young man. Rolitz, it is said, is short y to visit Paris

The Town Council of Glasgow have adopted a report recommending one uniform rate of assessment for the relief of the poor throughout Scotland, or, in other words, to make the entire country into one parish.

NOVEMBER 27.—The Queen intends to visit the Crystal Palace by Colonel Sibthorp.—*The Monk, by Albert Smith and John Leech.*

IRELAND.

THE CATHOLIC DEFENCE ASSOCIATION AND LORD MONTEAGLE.—The following correspondence appears in the evening *Freeman*, just publish d ...

Cathe le Defence Association, 26th August, 1851.

My Lord,—I have the honour to inform your Lordship, that, at an aggregate me ting of the Catholics of United Kingdom, held in the Rotunda, on this day, the Right Hon. Fitzstephen French, and presided over by his Grace the Most Rev. Dr Cullen, Lord Archbishop o Armagh and Primate of all Ireland, it was moved by Mr. Sergeant Shee, and seconded by John Fren ch Maguire, lord mayor of Dublin, and unanimously resolved, that the most grateful thanks of the meeting should be cordially tendered to your Lordship and the other distinguished Protestants who so ably sustained in the Legislature the cause of religious liberty. I have the honour to be your Lordship's obedient humble servant,

The Right Hon. Lord Monteagle. JAMES BURKE.

Mount Trenchard, Foynes, Aug. 28, 1851

SIR—I have the honour to acknowledge the receipt of your letter of the 26th of August, communicating a vote of thanks from the meeting held at the Rotunda, over which you chaired the Roman Catholic Archbishop of Armagh presided. I beg to express my acknowledgments to you and the other persons who concurred in his vote. From the year 1828 when I was first called to and took part in by the invitation of the people of Limerick, to the present time, I have considered the promotion of the prosperity of Ireland to be the first duty of the Imperial Parliament, and the best security to the permanent interest of the United Kingdom. That prosperity can never exist without the most complete religious liberty. My services in your cause were consequently given under the guidance of Grattan, Plunkett, and Newport, and their associates. Whatever merit and high endowments had been for such a century devoted to the cause of Ireland and freedom, and whose names and whose example should never be forgotten by their countrymen. To the same cause I am ready still to devote whatever of time may be left to me. Believe me attached to the doctrines of my own Church, of which I have been one of the humblest and most adherent to form an essential principle, I feel that I should not only be guilty of an injustice, but of an unpardonable inconsistency, were I to be present party to the enactment of new penalties upon religious grounds. Nor do I think that those principles, which I shall ever assert without compromise, but with steady moderation, can in any respect limit either my power or my desire of vindicating and asserting the independence of my country, and the honour and authority of my Sovereign.

I have the honour to be, sir, your very obedient, humble servant,

James Burke, Esq. MONTEAGLE.

EMIGRATION.—CURIOUS STATISTICAL RESULTS.—The continuance of emigration upon a large scale causes much solicitude, and the question is asked on all sides, "Where is it to end?" Since the produce of the harvest has begun to come in, the emigration, which had been somewhat checked for a brief interval, has received an accelerated impetus, and there are preparations at the various ports for an active business during the remainder of the autumn, whilst the contributions from Irish settlers in the United States are daily augmenting. The *Dublin Evening Post*, with reference to this wholesale emigration, has the following curious statement:—"In March, 1841, the population of Ireland was 8,175,124; and there can be little doubt that, before the year 1851, it had increased to near 9,000,000. On the 31st March, 1851, the population of Ireland was only 6,515,794, which number has been still further reduced through subsequent emigration. The United States census of 1850 makes the gross population 24,000,000. According to statistical tables presented by Mr. William F. Robinson, M.A., in his lectures delivered on the 22nd of July, 1851, before the delegates of some American Universities and colleges assembled at Canton, in the state of New York, that mixed population was made up as follows:—

Irish born	4,000,000
Irish by blood	4,000,000
French and other Celts, by birth or blood	3,000,000
Germans, by birth or blood	5,000,000
Anglo-Saxon, by birth or blood	3,500,000
Coloured, free or slave	3,500,000
	23,000,000

"From these figures it appears that, at the commencement of the present year (1851), the total amount of Irish, by birth or blood, inhabiting either Ireland or the United States, was about 14,000,000; of whom about 6,500,000 were then in Ire and, and the remaining 7,500,000 in the states, where they constituted the most mendacious and entes prising portion of an active population. It may be fairly estimated that before the next decennial census of 1860-61, the above 14,000,000 of Irish will have increased to about 16,5,0,000, of whom, should Irish emigration continue to proceed at a rate exceeding a quarter of a million per annum, it is not improbable that about 13,000,000 may be found in the United States, and not more, perhaps, than 4,000,000 in Ireland, including among the latter number most of the impotent poor, and the very aged emigrant portion of the Irish people. The United States would thus become three times as Irish as Ireland. They are already more Irish than Ireland."

THE Earl and Countess of Carlisle have left Castle Howard, maintained a domestic bereavement, by the death of their infant son, who died a few days since, at the Grove, near Watford.

RACES, &c.—On Saturday, a very interesting *fête* was given by the directors of the Dublin and King-town Railway, on Rathney-hill, to the children of the regimental schools of Dublin garrison, and other schools of the city. The number of the company assembled about 2,000, among them being between 400 and 500 non-commissioned officers and privates. Hackney-coaches, military bands were in attendance, and vast numbers of persons from the city and surrounding country were attracted to the interesting scene. Amongst those present were one of the Lord Justices, Lieut.-Gen. Sir Edward Blakeney, K.C.B.; the Right Hon. Lord Gough, the Right Hon. Sir W Somerville, Colonel Sir Duncan M'Gregor, Lie. Hon. Lieut.-Col. M'Donald, and a number of other military gentlemen.

There are several candidates for the Professorship of Law in the Queen's Col ege, Cork, vacant by the death of Professor Walsh. Messrs J. Barry, J. O'Flin, J. E. Herrick, and some members of the English Bar, have been named.

NAVAL AND MILITARY INTELLIGENCE.

THE GOLD COAST CORPS.—The long-pending arrangements for the formation of this co ps are now understood, in a forward state. The establishment is to consist of one major commanding, who is also the civil governor of the settlement, three captains, three lieutenants, three ensigns, one adjutant, a quartermaster, and a staff-sergeant, 12 corporals, and 300 privates. It is also understood that the officers will not be required to serve longer than three years on the coast.

The Lords of the Admiralty have rescinded the order that no contract mail steam-ship shall be built of iron.

PAY AND ALLOWANCES OF THE ARMY.—The following statement showed the estimated charge for the year ended 31st March last for pay and allowances of the cavalry and infantry regimentals—for household cavalry, £36,728; cavalry of the line, £325,294; foot guards, £192 4.3; infantry of the line, £2,2.,3,713; West India regiments, £103,9o0; colonial regiments, £149,580. Total pay and allowances, £3,070,036.

OUT-PENSIONERS.—It appears by a Government return, that the number and charge of out-pensioners (exclusive of militia) was—

	Number.	Charge.
In 1828	89,793	£1, ...
In 1850	66,777	.. .. ..
Decrease since 1828 ..	22,956	£.. .. ..

THE WAR MEDAL.—The board of general officers for examining the application of the claimants to additional clasps, are now calling upon those claimants who have already received the war medal, to return that medal to Whitehall, in order that the name of the battle for which they have not been allowed credit may be added thereto.

NELSON'S DESCENDANT IN THE NAVY.—The Hon. H. M. Nelson, son of Viscount Nelson, and great-grand-nephew of the illustrious founder of the name and title, has entered the service as a cadet in Nelson's own flag-ship, the *Victory*.

On Saturday last the Rev. Dr. Francis Hessey preached a sermon on behalf of the Royal Humane Society, at the parish church of Kensington; taking his text from the 38th chapter of Isaiah, and the 18th and 19th verses; and after enacting a most eloquent appeal to a crowded congregation, they collected a very lively interest in the objects and welfare of that institution by a liberal contribution in aid of its funds.

AN OVERLAND JOURNEY TO THE GREAT EXHIBITION.—By RICHARD DOYLE. (Chapman and Hall.)—There have been already a few humorous illustrations of the Great Exhibition; but, for grotesque humour, and really comic treatment, commend us to these three parts of "Overland Articles and Visitors," from Mr. Doyle's exuberant pencil. The long picture is a most multi-national procession to the Crystal Palace: it is, properly enough, headed by John Bull, followed by the Imperial personages of all nations, not forgetting the Nigger with his bag. Next come a host of all revolutionary shades of character, bearing a French Tree of Liberty, leaders, and a small army with a *bonnet rouge*, and a few other empty insignia of vain glory, the bearers, desperate potentates and wicked-looking men and citizens, is cleverly pourtrayed. To these succeed a group of vocalists, headed by a double-bass, personifying Italy. A little family of "Buy-a-brooms" come next; then a group of Scotchmen, with the whole World's Show in front of them, followed by a Spaniard, with a load of cigars. A German band of wind instruments is succeeded by carousing and smoking groups, whose physiognomy is admirably hit off. Next is the Goddess of Liberty, with two captive negroes in chains, followed by a *knot* of American planters bearing in triumph the slave whip! A zoological group brings up the rear, headed by the American eagle, with a revolver under his wing and a Jonathan hat upon his poll. Next is the British lion, the Gallic cock, the black eagle the bear, the elephant, and the unicorn; at whose tail a band of rogues are grouping a grand march to the World's Show in London. In respect of character, so important an element of success in a picture of this class, we have rarely seen this "Overland Journey" approached. The satire is piquant throughout, and the artistic treatment admirable.

GROSS CASE OF FRAUD.—On Saturday, in Birmingham, the magistrates assembled to hear a charge of imposture against a woman styling herself the "Baroness von Rock," but, on her way from the ante-room into the court, she fainted, and died before assistance could be procured. Her real name was Randona; and, instead of being, as she represented, a noble Bavarian lady, intimate with Kossuth and other persons of note, she was a woman of bad character, and a *sage-femme*, in the pay of the American police in London. She had obtained several sums of money on pretext of publishing her "Memoirs," and had received great kindness from Mr. Tyndall, out of pity for her pretended misfortunes and her real illness. At the request, Lord on Wednesday, it was proved that ... and the jury returned "Died by the visitation of God."

NATIONAL SPORTS.

The calendar for the next week contains no less than fourteen meetings, with nothing "great" to entice the professional speculator; being the week before Doncaster, the provincials are likely to have nearly all the fun to themselves The fixtures stand thus:—Monday—Lichfield. Radcliffe, Cheade (Staffordshire) Chester, and Bromley. Tuesday—Harmondsworth. Wednesday Leicester, Weymouth, Liverpool Hunt, Morpeth, Weston (Bridgewater), and Tunbridge Wells. Thursday—Uttoxeter and Ripon.

The gaiety will take place on Tuesday, on the Frith of Clyde, at the Custom House, and at Largs.

The only Cricket fixtures are, a match at Bradford, on Monday, and, on Thursday, at Newburgh Park and Heckham.

TATTERSALL'S.

MONDAY. Most of the backers of horses going at the moors, we are constrained to make up an average few transactions of very small amount:—

15 to 3 agst Hebbers	7 to 1 agst Jagleman	12 to 1 agst Grief
5 to 1 — Gollingher	7 to 1 — Ascot	12 to 1 — Windhound
	MATCHES.	
Even on Caribee		6 to 1 agst The Black Doctor
	GREAT YORKSHIRE HANDICAP.	
5 to 1 agst Calculator	5 to 1 agst Gaiusa	6 to 1 agst Nancy
	6 to 1 agst Cossack.	
	CHESTER CUP.	
5 to 2 agst Harnander	8 to 1 agst Aphrodite	12 to 1 agst Hotspurs
5 to 1 — The Ban	12 to 1 — Newmilnace	20 to 1 — Grecian.

ANTWERP REGATTA.—The winning boat, and the second boat (pulled by an Ostend crew) were both built by Nouton and Wyld, of Lambeth.

APPREHENSION OF THE ESCAPED CONVICT HACKETT IN NEW YORK.—Thus reports our criminal, who, it will be recollected, was convicted in this country of burglary, sentenced to transportation for fifteen years, and subsequently made his escape in a most extraordinary manner from the Model Prison, at Pentonville, proceeded to the United States. Since last period his brother has been convicted of felony and transported. A letter recently received from America by Mr. Payne, one of the United States police, who is over here to watch some of his disreputably honest countrymen who frequented the Exhibition, states that, notwithstanding Georgo Hackett, the escaped convict, was supposed to have had in his possession a considerable portion of his ill-gotten wealth, yet his ruling passion for plunder prevailed at New York, and among other degradations he proceeded to the residence of a gentleman named Williams, in Lafayette-place, called Newark, new York, and with others, not in custody, broke into the house, and abstracted therefrom a quantity of plate, valued at 3000 dollars. For this offence he was speedily apprehended, and committed to Jersey gaol, to await his trial; and there, too, he made an attempt to escape, which was nearly successful. One of the turnkeys, well acquainted with Hackett's reputation, had been watching him more than ordinary vigilance, and on coming to look him up for the night, suddenly missed him from the place he should have been in at the time. Search was instantly made, and he was found secreted near one of the outer passage doors of the building, ready to avail himself of the first opportunity to escape, as he did at Pentonville. Suspicion in the meantime was directed towards his accomplice, and he was also dragged from his hiding-place by the prison officers. On being searched, a large pointed knife, resembling a *couteau du chasse*, was discovered in the leg of his pantaloons, though how he obtained it is at present a mystery. On his being brought to light, he sullkly exclaimed, "Every man has his day, and George Hackett now will have ours—for our lives aint worth much in this way." They were both re-conducted by a secret route to distant and separate cells under very close surveillance, and ironed till the trial. The woman who accompanied them from England is also committed for trial, sufficient evidence having been adduced to connect her as an accomplice in the same robbery.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The English market has displayed a better tone this week, a partial rally of prices having occurred. On Monday Consols opened at 98¾ 99 for money, and some purchases of stock for immediate transfer improved prices to 99⅛. This upward tendency continued on Tuesday, and an advance of ¼ per cent. was realized; but, on Wednesday, after some purchases by the Government broker, business became dull, and Consols again receded to 99⅛ to ⅜. The upward tendency of the market on Thursday was again checked by the reappearance of a conspicuous seller, and the market, although not materially depressed, has not rallied. The unfunded debt maintains former quotations, and India Bonds have not shown any decided change. Bank stock was rather flat on Wednesday, and closed at 213 to 214.

The transfer books of the stocks open which a dividend falls due in October, will close for reduced on the 11th September, and New 3¼ per Cents Bank Stock, &c., on the 12th. At the close of business prices stood:—For Bank Stock, 213; Reduced, 99⅛; Consols, 99⅛; New 3½ per Cent. Annu., 98⅜; Long Annu., to expire Jan., 1860, 7 7-16; Ditto, 36 years, Jan. 5, 1860, 7⅛; India Stock, 260; India Bonds, under £1000, 92 p; Consols for Account, 99⅛; Exchequer Bills, £1000, 98 p; ditto, £500, 98 p; ditto, £100, 98 p; Bank, 48 p.

Mexican Stock and Sardinian Scrip have been the two fluctuating securities in the foreign Stock Exchange this week. Mexican has ranged from 27¾ to 28¾; and Sardinian Scrip from 19 to 20 p. Peruvian is also a shade flatter; but on the other securities no great change has occurred. Business, during the week, has been bounded by the most narrow limits, the last quotations being:—For Brazilian Bonds, 93; Danish Bonds, 1825, Five per Cent., 101¾ ex d; Granada Bonds, One-and-a-Half per Cent., 14½; Ditto, Deferred, 3⅜; Mexican, Five per Cent., Account, 28¾; Peruvian Bonds, Five per Cent., 93½; Portuguese, Account, 33¾; Sardinian Bonds, Scrip, 2 dis; Spanish, Five per Cent., 1840, Account, 20¾; Ditto, Four per Cent., Certificates, 9½.

Shares at the commencement of the week showed some symptoms of improvement, but since Native sales have come damped prices, notwithstanding the increased traffic returns. Closing quotations are

ORDINARY SHARES AND STOCKS.—Ambergate, Nottingham and Boston, Eastern Junction, 4⅝ x d; Bristol and Exeter, 79 x d; Caledonian, 10½; Chester and Holyhead, 14½; Eastern Counties, 5½; Great Northern, 104 x d; Ditto, Halves, A, 5½; Ditto, Halves, B, 12; Great Southern and Western (Ireland), 38½; Great Western, 76½; Lancashire and Yorkshire, 48; London and Blackwall, 6⅝; London, Brighton, and South Coast, 90; London and North Western, 113⅝ x d; Ditto, Quarter, 28¾ x d; Ditto, Loan, 4.0; Ditto, Shares, 19; London and South-Western, 80½; Manchester, Buxton, and Matlock, 2½; Midland, 41⅞ x d; Ditto £50 Shares, 14¾ x d; Ditto, Birmingham and Derby, 19 x d; Newmarket, 7½; Newport, Abergavenny, and Hereford, 3; North British, 38 ex new; Oxford, Worcester, and Wolverhampton, 14¾; Shropshire Union, 3⅝; South-Eastern, 10¾; York, Newcastle, and Berwick, 16⅝; Ditto Extension, 1⅛; Ditto G. N. E. Purchase, 8⅜; York and North Midland, 10 x d

LINES LEASED AT FIXED RENTALS.—Birmingham and Oxford Junction, with rent guarantee, 28; Birmingham, Wolverhampton, and Dudley, with a guarantee, 23¾; Leeds and Bradford, 100 x d

PREFERENCE SHARES.—Caledonian, 7; Chester and Holyhead, 15; Oxford, Worcester, and Wolverhampton, 6.

FOREIGN.—Luxembourg and Amiens, 10¼; Luxembourg, £10 paid, 11; Namur and Liege, 5¼; Sambre and Meuse, 3

FRIDAY AFTERNOON.—Scarcely any business either for money or time, has taken place in the Consol market to-day, and prices have ruled almost nominal. The Three per Cents. have marked 99⅛; the New Three-and-a-Quarters, nearly 98⅝; and the Three per Cent. Reduced, 98¼; Bank Stock, 213⅝; Ind a Stock, 260; India Bonds, 92 p; Exchequer-Bills, 98 p; and Consols for Account, 99⅛. Owing to the unfavourable news from Australia, 47¼ shares changed hands in the Australian Agricultural Company to-day, the demand for all kinds of wheat of home produce ruled inactive at prices equal to those obtained on Monday. The supply of foreign wheat has been confined to 6010 quarters Selected samples of both red and white were held at full currencies; but low and middling parcels were scarcely asked any attention. In floating cargoes next to nothing doing Scarcely any English barley was brought forward, and the supply of foreign consisted 8.00 quarters. All kinds were a slow sale, but no change Malt the supply of which was good, ruled very dull, at barely late rates. Good sound oats moved off at very full prices. Damp parcels were almost nominal. Beans peas, and all other articles were almost nominal.

ARRIVALS.—English wheat, 3,4.0; barley, 100, malt, 1,000; oats, 1,000; flour, 1,800; wheat, 5,010; barley, 800; malt, —; oats, 14,200; flour, 2,800 sacks.

FOREIGN ARRIVALS.—Wheat, 6,010 quarters; barley, —; oats, —; beans, 280; peas, —; flour, 2,800 sacks.

ENGLISH MARKETS.—Wheat, Essex and Kent, red, 38s to 42s; ditto white, 40s to 44s; Scotch and Irish, ditto, 38s to 42s; rye, nominal; barley, grinding, barley 21s to 24s; malting ditto, 32s to 36s; malting, Chevalier, 40s; Lincoln and Norfolk malt, 44s to 46s; brown ditto, 42s to 43s; Kingston and Ware, 50s to 52s; Chevalier, 54s to 56s; Yorkshire and Lincolnshire oats, 22s to 23s; potato ditto, 19s to 20s; Youghal and Cork, 18s to 19s; Limerick, 17s to 18s; Sligo, 16s to 16s; ditto, old, 22s to 23s; grey peas, 23s to 27s; maples, 27s to 28s; white ditto, 27s; beans, 32s to 33s per quarter. Town-made flour, 38s to 39s; Suffolk, 37s to 38s; Stockton and Yorkshire, 32s to 33s per sack. Foreign: Barley rod wheat, 40s to 42s; white, 42s; barley, —; oats, —; beans, —; peas, —; flour, —; per quarter. American flour, 19s to 22s per barrel; Canada, —; to —; per sack.

The Seed Market. Generally speaking, the demand is in a very inactive state, and best prices are barely supported. The arrival of new seeds is large, especially tares and mustard.

Linseed, English, sowing, 60s to 65s; Baltic, crushing, 48s to 48s; Mediterranean and Odessa, 44s to 46s; hempseed, 32s to 36s per quarter. Coleseed, 18s to 24s per cwt. Brown mustard-seed, 6s to 7s; white ditto, 6s 6d to 8s 6d. Tares, 4s 6d to 5s 3d per bushel. English rape-seed, new, £21 to £22 per last of ten quarters. Linseed cakes, English, £6 10s to £10, ditto, foreign, £6 0s to £8 5s per 1000 Rapeseed cakes, £4 0s to £4 10s per ton.

ENGLISH COUNTRY MARKETS.—Wheat, red, —s to —s; extra, —s to —s, white, —s to —s; extra, up to —s. Foreign, red, —s to —s; extra, —s to —s, white, —s to —s; extra, —s per quarter.

Bread. The prices of wheaten bread in the metropolis are from 6d to 6½d; of household ditto, 4½d to 5d per 4 lb loaf

Imperial Weekly Average.—Wheat, 32s 1d; barley, 25s 10d; oats, 20s 6d; rye, 30s 4d; beans, 30s 7d; peas, 29s 6d

Duties Weekly Average.—Wheat, 41s 3d; barley, 26s 8d; oats, 21s 7d; rye, 27. 6d; beans, 31s 2d; peas, 27s 6d

Duties.—Wheat, —; barley, 1s; oats, 1s; rye, 1s; beans, 1s; peas, —

Tea.—Public sales of 10,500 packages have taken place this week The holdings were in active, and barely a nominal sale. Common sound congous quoted at 10d to 10½d per lb Ordinary to fine congous have been in request this week at full prices. Sales of 1,000 chests of Assam tea took place this week. Good to fine qualities were in demand, and fully supported

THE CHEAPEST AND BEST WEEKLY PERIODICAL EVER PUBLISHED

PRICE ONE PENNY

THE LONDON JOURNAL, a Weekly Epitome of Instruction and Amusement has now reached the largest circulation of any similar work ever published, nearly 300,000 of each publication—A sixth part guarantee for the merit of the 3 preceding volumes now comprising THE LONDON JOURNAL is a complete library of useful and interesting information, and a pattern guide. Any Lawrence, the first designer in fashion, which should by ready every week of this pure and beautiful in colour. The narrative is richly illustrated by Engravings in the most elegant style of execution for which the "London Journal" has ever been distinguished.

The work is also issued in Monthly Parts, price 5d each, and without the Numbers and Parts, Vol. I. to XIV. are now ready, handsomely bound in cloth, gilt edges, price 1s each.

Also in 4 Monthly Parts, price 1s each, and without the Numbers, Vol. XV. is now ready, price 4s 6d.

And in 4 Monthly Parts, price 1s each, Vol. XVI. with Portraits of Louis XIV and Cardinal Mazarin. Per volume, 3s 6d

HENRY G BOHN, York-street, Covent-garden.

Vols 1 and 2 now ready, elegantly bound in ultramarine cloth, gilt edges Price 5s each

GIRLHOOD of SHAKSPEARE'S HEROINES A Series of Fifteen Tales By MARY COWDEN CLARKE Published 30 April for Wellbeing Books each containing a complete Story For 2 Volumes contains five stories No. 10 now ready

Hall Court

THE AUTHOR'S GUIDE

To the Publication of Poems, Essays, Novels, Tales, Letters, Political Pamphlets, Sermons, &c.

THE ART-JOURNAL

ILLUSTRATED CATALOGUE OF THE GREAT EXHIBITION OF 1851

This interesting and valuable work is ready for delivery at the Office of the Art-Journal, 17, Pall-mall East, and by all Booksellers and Newsmen in town and country

Price 1s. 6d. Stamped Edition 2s. Subscribers Copies 1s.

Now ready, uniform with that very popular book, "The Morning of Life"

MY FIRST GRIEF a recollection of a Sister's Grave A Memoir and Autobiography By a Poor Man Illustrated with Engravings on Wood Price 1s. 6d. Cloth gilt 2s. 6d. Some may like it for its quaintness, some for its pathos, some may like it for its commonness, but there is in both some ideas of commonness, pathos, and quaintness, and there is in both some ideas of commonness, pathos, and quaintness, and there is in both some ideas of commonness, pathos, and quaintness, and

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS.

No. 515.—VOL. XIX.] SATURDAY, SEPTEMBER 6, 1851. [TWO NUMBERS, 1s. WITH WHOLE-SHEET SUPPLEMENT, GRATIS.

THE GREAT EXHIBITION.

THE LITERATURE OF THE EXHIBITION.

THE Exhibition is a most interesting show. A pleasanter lounging-place for the rich never was created. To a more gratifying scene the hardworking poor were never invited. To both it has given a common pleasure, and inspired with a common interest. They admire and talk about the same objects, most of which are equally new to both. The well instructed have the advantage of understanding the objects they behold; the ignorant are vividly struck with the splendid novelties, and find some compensation for the want of knowledge in their more lively impressions. The present effects of the World's Fair in exciting an interest in the products of industry, familiarising classes and nations with things before strange or unknown, bringing together exhibitors and visitors from every part of our own empire and from most parts of the world, giving information to all, and establishing friendship and harmony between strangers of every clime and every creed, are much too well known, and have been too often dwelt on, to require any further elucidation. They are only adverted to, undoubted as they are, because they lead from the present to the future, and incite us to inquire into the probable effects of the Exhibition hereafter. It is only the savage who is perfectly satisfied with the present; civilised man, by prudence and foresight, takes a guarantee for the future. He knows that the wine, which sparkles in the cup, afterwards "bites like a serpent and stings like an adder," and he is very properly not contented unless he have a reasonable assurance, that present enjoyment will not be future trouble and misery. However difficult it may be to explain the reasons why, in many cases, and not in all, present bliss should be future sorrow, the fact is so; and it opens a large field to the fancy of those who are disposed to take the adverse side of any question; and they can always rake together numerous plausible and alarming suspicions, that, the more soft and flowery our present paths, the more certainly do they lead to destruction. To meet such cavillers, and show that the probable future effects of the Exhibition will be beneficial like its present effects, rather than to describe any part of its contents, is the object we have now in view.

We mean to speak of the literature of the Exhibition: not, however, of the various specimens of French and German typography with which it is enriched; not of the 170 versions of the Holy Scriptures, displayed by the British and Foreign Bible Society; not of the almost matchless specimens of the art of printing—using the word in its most enlarged sense—to be found in the Austrian department; not of the types of almost all the written languages of the globe, exhibited—however little noticed, all these are extremely valuable and important; but we propose to pass them by, and speak only, of the literature that has already grown from the Exhibition and is an inseparable part of it. We select that, because it will be more by the influence which the Exhibition now exercises over it, and more by the subsequent influence of literature over the public, than by any other means, that the permanent characteristics of the Exhibition will be established. It will live in print, and by print hereafter will its effects be known. Probably all great events become permanently influential by similar means. Without pretending to compare the Exhibition with the discovery of America, or our great Rebellion though it marks a very important epoch in the history of mankind—as those stirring events were the parents of the gigantic minds of Bacon, Shakspeare, Milton, and Newton, so will the Exhibition, deeply agitating nations with the spirit of kindness, be the parent of some large mental developments. Impressing first its own peculiar features, whatever they may be, on the literary men of the age, by them they will be transmitted, enlarged, purified, and beautified to future generations, and will help to form the character of our children and our children's children.

One peculiar feature of the Exhibition, peeping out from the spangled and gilded ornaments, announcing itself massively, broadly, and unmistakably in the machinery, and winning us by its gracefulness in the sculpture, is well-defined form, leading to precision of eye, precision of language, and precision of character. Every one has, of

THE ANCIENT BRITON.—BY ADAMS.

THE GREEK HUNTER.—BY GIBSON.

This page is embellished with two works of British sculpture, the Greek Hunter," by Gibson, in marble, in the Sculpture-room; and Adams' "Ancient Briton" looking out as a scout, in plaster, in the Transept. The former is an admirable production, and the latter evinces considerable spirit and is creditable to the artist. We have, however, already sufficiently spoken of both these works in our notices upon sculpture.

course, noticed the long technological descriptions in the newspapers of the multifarious articles in the Exhibition, and of the arts connected with them. These technological descriptions are new features: every now and then, as a new invention starts into life, or an inventor calls on the public to test or to admire some great improvement, the newspapers have taken notice of it, or, if it have been important, have given as accurate a description of it as the talents at their command would supply. But the Exhibition has induced them to enlist in their services eminent technologists of all kinds, and has induced many writers to make it their express business to study industrial processes, to compare and comprehend the distinctive characteristics of their various products, in order to describe them. Its immense and varied contents, comprising more of the results of industry than were ever before collected or noticed in our books, have accordingly been, or are in process of being, minutely described with more or less skill, but in general with great accuracy, in the majority of the journals of the empire. To literary men such pursuits must impart habits of precision, a spirit of close and minute observation, and much valuable knowledge. It is for them, in fact, a new education; and, banishing the poetry of fiction and dreams, will inspire them with the poetry of reality. It will have a corresponding effect on the literary character. Habits now formed by its influence will not be readily laid aside, and they will influence the future lives of individuals and of nations. The very multitude of the objects exhibited drives man to classification as the refuge from confusion; and precision, therefore, first impressed on literature, and afterwards by literature impressed on society, seems one of the prevailing, and likely to be one of the enduring, moral effects of the Exhibition.

Nor is this fact the less remarkable, nor will it be less influential, from being only an extension, though a sudden and rapid one, of a progress before obvious. For many years it has been observed, particularly in the manufacturing districts and in the mind connected with them, that the tendency of literature has been towards realities. It has been marked by careful observation and accurate description of the production of industry and the condition of society. The rapid development of this tendency by the Exhibition falls in with the previous and general improvement, and is a permanent part of it. It is not an imported exotic—a mere excrescence, to be out grown and cast aside; a temporary phasis of the mind, like a wide-spread love for sentimental novels; or an ebullition of philanthropy in favour of ragged schools; or a fashionable attachment to dresses that sweep the streets; or even like the running to the World's Fair itself: it is a healthy growth, and part of the general intellect—a permanent step forward, the necessary consequence of the past, and indicating the more advanced future to which society is hastening. We cannot live by fictions and unrealities. They may prevail temporarily, in conjunction with the real and the true; but by these men maintain themselves on the earth, and by these society is improved. When we say that the Exhibition promotes precise knowledge, we mean that it is hastening for all the dominion of the real and the true. The effect is not confined to England, though more conspicuous here than elsewhere. Amongst the Germans, technological education is already provided for; and, so far as the arts have gone, the Germans are well acquainted with their history. It has been written for the instruction of the young, and is carefully taught them in most schools. It forms a part of their extensive and excellent scheme of instruction. Amongst them are numerous technologists ready made, and several well-informed men and clever writers have been sent hither, and have supplied the German journals with detailed descriptions of the articles in the Exhibition. The French have done similarly, though not so extensively, as the Germans. Both have excelled—though, of course, not equally with ourselves—the plan of illustrating their writings; and the art of the engraver has given *distinctness*, as well as force, to their verbal descriptions. The effects of the Exhibition on literature, therefore, giving increased care in observing minute differences, adding to precision, and spreading a knowledge of realities, will be similar all over Europe—if not so immediately striking in other countries as in England. The physis of the mind is general as well as permanent; and, whatever may be its consequences, they will not be confined to our own country.

We have referred to newspapers as bringing the characteristics of the change under the notice of all; but other literature shares in the influence. The monthly and quarterly periodicals are becoming more scientifically precise and technologically accurate. They discriminate with increased care between the products of different countries and different arts; discuss with much minuteness the merits of rearing machines and printing presses; describe the different qualities of English and French silver velvet, of Brussels lace, and Swiss embroidery; in short, they, too, feel the influence of the Exhibition in making literature more minute and careful, and more attentive to facts. Of the numerous catalogues of the Exhibition requiring an immense amount of minute labour and careful research we say nothing, because the quality of precision is eminently their character-tic. Many of them, like the official descriptive and illustrated catalogue now in course of publication, have well-executed engravings of many of the articles in the Exhibition. The Illustrated London News has many competitors, but no equal; and all the works connected with the Exhibition necessarily display a minute and careful attention, while they lead only with interesting realities. The mind will be drilled by many charming novelties into a love of facts, and will not readily go back to vagueness, uncertainty, and fiction. Thus educated, the public will require a similar spirit in writings not connected with the Exhibition, and the direction it is now giving to a part of our literature will be more or less imparted to the whole. In truth, knowledge has, from the very first, been advancing from the shadowy and the vague to the definite and the precise; from loose individual perceptions, to firm and general truths; the progress will be accelerated by the Exhibition, which merely gives a fresh impetus in the old direction.

The civilisation of Europe, so far as it depends on religion and science, is, to a great extent, common. If it vary in degree in different countries, it has gone, or is going, through nearly the same phases in all. The sciences of astronomy, geology, and chemistry, for example, and the arts connected with them, such as printing, painting, engraving, smelting, &c., are common to all the nations of Europe. All the arts of life are founded on some principles common to the whole human race, and are practised in a similar manner. From science being everywhere the same, we draw the inference that all men are somewhat alike. They everywhere receive similar impressions from the external world. We all recognise at once the objects a skilful painter places before us. From the same circumstance we also draw the inference that the external cause of man's impressions is everywhere the same. In other words, one spirit animates the whole universe, lives in the external world, and moulds the intellect—is adapted to man, and man to it. He comes everywhere gradually to comprehend it in the same manner. There are two astronomies, two mathematics, or two chemistries—one for England and another for Italy; there are not separate sciences for every distinct country, but only one science for all. This similarity or uniformity of knowledge constitutes the true brotherhood of mankind. They have similar wants, and learn similar means of gratifying them. They have, therefore, a common parentage. Their moral nature is similar, and the external world is the same for all.

These common features and intimate relationship were known before the Exhibition; but it has intensified them all. It has set nothing aside, undone nothing, but confirmed and ratified what before existed. It has especially made evident and palpable to all the universal prevalence of a common industry, directed to similar purposes, and guided by similar rules. The differences between the productions of China and France, of Hindostan and the United States, are not so remarkable to reflecting minds as their similarity. Not only similar arts exist in the most distant countries, but similar inventions have taken place; and—not to speak of the art of making paper, earthenware, and ships, gunpowder, printing, and bank-notes have all been invented in China as in Europe. The great feature of a common parentage, made plain to all by the literature of the Exhibition, cannot fail to influence the fate of mankind. As the common knowledge of the one external cause extends, moulding the minds of all alike, and as the common wants and common means of gratifying them become known, mankind must become more closely linked together. The friendless display of the Greenlander, the Chinese, Tunisians, Germans, Spaniards, Americans, &c., is obviously no fortuitous event, but the necessary result of their common knowledge and common pursuits. From such facts, it is to be inferred that the laws which govern the universe, to which the progress of society is in conformity, are opposed in the long run to the continual political separation of mankind into adverse and hostile nations. We see, in fact, that the separation is lessening and disappearing. The Exhibition has both confirmed the fact, and helped much to explain the law on which it depends. Now, as all legislation and statesmanship look to the future, the Exhibition, with its literature, will be of political value. It proclaims as a great truth, that no legislation can be durable, no statesmanship beneficial, which does not fall in, like the Exhibition itself, with the general progress towards acknowledging and promoting a common brotherhood.

By showing us that all art is founded on common principles, and on sciences common to all, it impresses on us the important truth, that we shall be powerful, wise, and happy, not as we gain victories over each other, but in proportion as we comprehend that external cause to which all science relates. By comprehending it, we obtain its assistance—the assistance of power that is for us wonderful and almighty—or become like unto it. The practical knowledge taught by the Exhibition will much promote this end. It is opposed to chimeras and shams of all kinds. It is a deadly foe to unrealities. Its great attractions fix attention, require close examination, and compel comparison. If there be connected with it, as some persons assert, no little quackery and no little false pretence, its overbearing principle is that of actual precise truth. It subjects the quackery it may excite to the severe test of comparison with the real and the good; and if it give some trumpery a momentary predominance, it is only the more effectually to sweep it away with all that is trivial and worthless. By some persons it is thought—and for the moment it may appear so—that one characteristic of the Exhibition is to exalt the trivial, and give currency to the worthless, and make us rather pleasure-seeking triflers than earnest men, conscious that moral life is a struggle after improvement, and must be manfully contended for. To that supposition, the precision, which is its chief characteristic, will be, in the end, decidedly opposed; and we believe that its permanent effects, totally different from what is expected of it, will be mentally elevating and ennobling.

A great part of the Exhibition consists of luxuries and ornaments—of jewels for the few, rather than of bread for the multitude; but it contains also working models of powerful and valuable machines. Bringing the two together, forces on the mind at once a comparison and a contrast between the merely ornamental and the useful arts. A steam-engine and the Koh-i-noor are placed before us, and we are called on to choose between them. An improved Jacquard loom, or a power-loom that appears instinct with life, or a printing press, arrests attention as well as the sculpture in the Nave and the glittering works in the French department. We depreciate not a single object exhibited, or any product of industry; but these various articles being brought together, the public will judge of them, and form a faithful opinion of their relative value. We submit in the common market a princely estate, a case of diamonds, a cargo of tea, a pound of potatoes, or a handful of cherries, to the test of competition or higgling to determine the value of each; and in all the great business of life we rely on the judgment of individuals. Will the public not then be able to form correct opinions of the utility of a great machine, or a little frippery? and may the rulers and guides of society not rely, with the utmost confidence, on the public mind coming to a sane conclusion? We, at least, trust the public. We believe it will form as correct an opinion of the articles exhibited as of the value of wheat or leather; and one of the great improvements effected by exhibiting many things side by side will be, to improve the general discrimination between the merely ornamental and the useful—between the costly ornaments of a lady's toilet and Mr. Maudsley's powerful steam-engine. Instead of making the spectators in love with finery and charmed with luxury, the Exhibition will give them a high idea of human power, and tend to make them discard trivialities as unworthy of man. We apprehend that it will not only increase careful discrimination between the useful and the merely ornamental, but it will tend to carry out the principle of the latter, and make it more graceful and more beautiful.

As the rule, we may say that the useful arts are the handmaids of the multitude; the ornamental arts, of the few. The former, depending on the increase of population, which makes progress a necessity, are much more rapidly and certainly improved than the latter. Accordingly, while our journals teem with numerous and loud complaints of a general want of taste—of the ornamental arts being neither understood nor appreciated—only admiration is felt for our wonderful mechanical contrivances. The ornamental arts, subserving chiefly the pleasures of the few, have in them something conservative, and they change less and are improved less than the useful arts. In sculpture we are still proud to imitate the Greeks, and rarely hope to attain perfection. In painting we do not surpass the Italians of the Middle Ages. Our carving is, perhaps, less skilful than that of the Chinese; and few of our silversmiths reach the excellence of Benvenuto Cellini. The colours of our garments, their shape and texture, and the ornaments of our houses, are about equal to those of the Hindoos and the Romans. But our power-looms, railroads, locomotives, spinning-mules, telegraphs, tubular bridges, &c., far beyond anything the people of antiquity ever dreamed of, are the pride of this generation. They are our own invention, and we deem them much more worthy of our admiration than the products of arts we have inherited from the rude nations of antiquity. It may be suspected, therefore, that the superiority sometimes assigned to the ornamental and fine arts is more due to their gratifying the tastes of a few, and to an inherited reverence for them, so far as this generation is concerned, than to their intrinsic worth.

Impressing on man the realities of his condition, and bringing into comparison and contrast the results of various arts and industry produced in all parts of the world, the Exhibition will necessarily inspire increased admiration for the wonderful skill that lifts man out of the hard necessities, the mire of barbarous life, and seemingly places him on the vantage-ground of a mastery over nature. It will proportionably abate his admiration for ornamental arts that are worthless; at the same time, placing their products together, as they come from different places, it will facilitate the detection of the principles on which the pleasure they give depends, and help to improve them. The admiration excited by our noble machinery, must make men disdain mere unmeaning trivial ornament, that has nothing to recommend it but its costliness; and we may hope that the Exhibition, while it increases the knowledge of the true, of the beautiful, and the good, discouraging in the end a number of pursuits that have no other object but to gratify vain and senseless parade.

The moral effects of the Exhibition on literature, and, consequently, of its literature, will be most beneficial. Displaying to man the real sources of his power, teaching him how much he is indebted to the inquiries of the philosopher, the skill of the manufacturer, and the art of the machinist, his reverence will be lessened for all those whose influence over the minds of civilisation is by no means equal to their pretensions. Men will form opinions, and the Exhibition will help them to form correct opinions. These are probably more needed at present in the moral than in the physical sciences; and if the habit of precision generated in the multitude from investigating material objects be extended to their political pursuits, their gain will be very great. Abating admiration for mere ornament, the Exhibition is likely, quite contrary to expectation, to lessen the undue desire for wealth as a means of obtaining distinction. Increasing admiration for the useful arts, it will compel the genius and talent of the age to improve them. It seems impossible that the men, who are subduing all nature by their skill, should ever entertain a meaner ambition than that of continuing their success. As the warriors of old, proud of their strength, and continually impressed by hostile conflicts with the superiority of war to all other arts, gave up the distaff and domestic employments to the women, so must this generation and its successors, proud of the arts which improve society, proud of the command which knowledge, skill, and powerful machinery give man over nature, chiefly honour them, and slight a thousand trivial claims that are now made on their respect. With such noble objects to interest the feelings of men, vulgar ambition will pale its fires; and the highest talent, proud only of conquests over matter, will cease to aspire to enthral the minds and bodies of its fellowmen. The common and great power over the material world, the result more or the general mind and general progress than of any one individual's skill, will be almost synonymous with equality in beauty. And we may look to the Exhibition, however unexpected may be these consequences, to diminish ruinous ambition as well as a ruinous love of wealth. As the teaching minds of society are devoted more and more to the useful arts, society will disregard practices that have now no other recommendation than that they were suitable to a former condition of society, when men lived predatory lives and had to fight for the means of subsistence. In all moral questions as well as in questions of the material world, in questions of government as well as questions of education, and regulating creeds, as well as sowing corn and navigating ships, the Exhibition, by enlarging man's knowledge of science, will make him more careful to study and obey the laws of the universe. Giving much delight to rich and poor, foreigners and natives, the Exhibition, sharing the attributes of nature, has improved the species by means of enjoyment. Taking place at a time when there is abundance in the land, and when the people generally are profitably employed, without which, in fact, it could scarcely have succeeded, it is not only a great present benefit, but it teems with physical and moral improvement hereafter. We do not say that it is a harbinger of a golden age, but it forms part of a period of very great peace and happiness, which it promises to continue and to increase. It is the townspeoples' child, rather than the child of the rural population; the offspring of trade, rather than of politics—of a population which is growing, and of principles which are just come, or coming into the ascendancy, rather than of a population which is stationary or principles which are falling to decay. We may count, therefore, on a further and continued increase of all its benefits. The literature that has grown from it, and describes it, and makes its existence known to many millions who are denied the pleasure of seeing it, must be very influential both now and hereafter. To draw attention to that literature, making it, we hope, still more influential and more worthy of the great cause to which it is devoted, is the object of the task now concluded.

PRIEST'S DRESS.—BY VAN HALLE, BRUGES.

PRIEST'S ROBES. HALLE.

Another of the embroidered priest's robes, by Halle, of Brussels, will serve to show the variety of device lavished upon these garments.

SEWELL'S BOBBIN NET MACHINE.

Perhaps the finest collection of net machines in this country, and which we have had the opportunity of seeing, is that at Tiverton, belonging to J. Heathcoat, Esq, M.P., who was the first to produce a practically useful bobbin net machine.

Many other persons also have exercised their ingenuity and skill in effecting useful novelties in this particular class of machinery; among others we may mention Mr. T. R. Sewell, of Carrington, near Nottingham, who contributes to the World's Industrial Display what is called a "double tier machine," in contradistinction to the "single tier machine," in which only one "row" or "tier" of bobbins and carriages is worked at the same time; whereas, in that under consideration, two tiers of bobbins and carriages are worked simultaneously. This machine contains 2460 bobbins and carriages, each bobbin containing about 100 yards of thread; an equal number of threads proceeding from the warp beam are brought into operation, round which the bobbin threads are twisted by means of the forward and backward motion of the bobbins and carriages.

Besides the motion of the bobbins and their carriages "to and fro" between the warp threads, they have another motion to the right and left, by means of which the bobbin threads are made to cross each other: this operation gives greater stability to the net, even if made of thread of very fine quality. When the bobbin threads have been twisted sufficiently round the warp threads, and have also crossed each other, as already mentioned, a set of steel points descend, and take up the twisted and crossed threads, and put them into the form of meshes; and thus, by continually repeating these operations, a piece of net is produced equal to 160 yards superficial, the quantity of twisted thread consumed for this purpose amounting to 246,000 yards. The size of the piece is, of course, regulated by the number of bobbins employed, and the length of thread on each bobbin. When a piece of net is completed, the bobbins are re-filled with thread, ready for a repetition of the operations described. The advantages of Mr. Sewell's bobbin-net machine are—first, its simplicity and economy of construction; secondly, its efficiency while in operation; and, lastly, its facility of management.

COLLINGE'S HORIZONTAL SUGAR-CANE CRUSHING MACHINE

The name of Collinge is well known, especially in connexion with axletrees and hinges. In the department of the Great Exhibition devoted to "machinery in motion," we find the exhibit by Messrs. Charles Collinge and Co. "an improved horizontal sugar-cane crushing machine," two screw lifting jacks, and a portable direct-acting high-pressure steam-engine.

Several machines for crushing the sugar-cane are to be found in different parts of the Building, including the gigantic apparatus of Messrs. Robinson and Co., of the Isle of Dogs. In Messrs. Collinge's cane-crushing machine, a vertical shaft is so arranged that power may be received either from a windmill, from cattle, or, if desirable, from a steam-engine; on one side is the "feeding board," on which the cane is first placed, and thence passing between three rollers is so completely crushed as to express the juice, which falls into a trough placed underneath the rollers, from which it is conducted by suitable pipes to the boiling-house. The amount of compressing force may be regulated to great nicety, by means of a screw adjustment acting on the bearings of the rollers.

THIS SHEET WAS PRINTED IN THE GREAT EXHIBITION.

A LADY'S GLANCE AT THE GREAT EXHIBITION.

No. IV.

In my last paper I endeavoured to give my readers some idea of the character and value of those precious stones in the Crystal Palace which owe their principal interest to their extreme size, rarity, or intrinsic worth. I propose, therefore, devoting my present attention to the examination of the jewellery exhibited in ornaments designed for ladies, and of which so noble a display may be seen in its various courts and galleries. The chief attraction of this class will be found in the taste and ingenuity which has been employed in the setting and arrangement of the stones; and nowhere shall we find stronger evidences of the additional beauty and enhanced value which can be given to the most exquisite works of the Creator, by the intelligence which he imparts to his creatures, than in the various depositories of this branch of art in Class 23. The variety of design displayed in the construction of the same object, which is one of the most interesting features of the Great Exhibition generally, is peculiarly exemplified in the various specimens of *bijouterie* presented there, in the shape of ornaments for the head, necklaces, bracelets, Sevignés, shawl-clasps, &c. The simplest forms with which we are familiar, in every-day life, and to which, from that very familiarity, we have hitherto scarcely been accustomed to associate the idea of beauty, vie here in arresting our attention with the most graceful combinations and elegant "conceits" which could be devised by the most fruitful and tasteful imagination. Here we shall find, in miniature, adapted to purposes of decoration never contemplated by their inventors, the graceful curves of the Gothic architects, and the fanciful arabesques of the Moor. Here may be observed designs which our great-grandmothers voted old-fashioned a century ago, but which time, strange to say, has endowed with the grace and charm of novelty. Here are *moyen âge* decorations, reminding us of the pictures of Holbein and the carvings of Cellini; nay, with a still more remote retrospect, for we may henceforth fasten our shawls with the *fibula* of the ancient Milesian chief, or encircle our arms with similar decorations to those which (ages ago) delighted the ladies of the court of King Rameses or the hapless daughters of Nineveh! Of all the varieties of design, however, which are presented to our sight, beautiful as they are, it is to those which we derive directly from the world of nature to which we shall be found to recur most frequently and with the greatest pleasure; and in these the refined taste of the present day has rendered the Exhibition peculiarly rich. The flowers of the garden, the leaves of the forest, the heritage of the field, the plumage of the bird, present here many of the most beautiful combinations of form that could be devised for ornamental purposes—

> To add a grace to what was fair before,
> And give to beauty one attraction more.

The exhibition of jewellery as applied to ornaments for ladies exclusively, is confined for the most part to the departments of England, France, Russia, Holland, and the Zollverein; and, I think, it cannot be denied, that, as a whole, the substantial value and sterling character of that exhibited by our own countrymen may fairly be said to bear away the bell.

The English jewellery, with the English plate, is to be sought for at the western end of the South-western Gallery, and thither will we first direct our steps. A short distance eastward of the top of the staircase is the large case of gold and silver plate of Messrs. Hunt and Roskell (late Storr and Mortimer); and at the further side of it we shall find the exquisite specimens of jewellery exhibited by that firm, and which, for extent, variety, and beauty of design, are not to be equalled by any in the Exhibition. The first object that will strike the eye from its position will probably be a portrait of her Majesty, painted in enamel from the well-known picture of Winterhalter, and exhibiting with much effect the characteristics of the original. It is not with the picture, however, that we have to do. Surrounding it within the case in which it is set is a wreath of oak leaves in green enamel, with acorns of gold and of pearls, enriched with diamonds and fastened at the stem with a ribbon of brilliants. Underneath this picture is exhibited the much-talked of bouquet of flowers in diamonds belonging to the Queen, and of which an Engraving and description were given in the ILLUSTRATED LONDON NEWS of July 26th. In the exquisite arrangement of this design, the perfect truth and elegance of nature is by the smallest bud and most unimportant leaflet is remarkable, as well as the lightness of appearance given to materials so apparently impracticable. What a contrast does it not present to the stiff, hard, heavy-looking patches of jewellery, framed as it were in formal squares, ovals, and circles, which formed the adornment of the *elegantes* some few years ago. On the *right* side of this bouquet is a necklace of emeralds of great beauty, ornamented with pendents of alternate pearls and emeralds, of which an Engraving has also been given; but what representation in black and white can do even partial justice to anything so delicate and so brilliant? A large collection of bracelets ranged above these specimens is worthy a long examination; one, of opals, more especially. It is formed of stones, which, though not very large, are remarkable for their beauty, and almost seem to combine in themselves the unobtrusive beauty of the pearl with the subdued lustre of every coloured gem beside. On the right of the set of emeralds, and as a sort of pendent to it, is a very elegant necklace, composed of rubies and diamonds, and a throatlet and stomacher of the latter stone only, of large size and of pure water. Moving round to the left-hand side of the case we shall find a *parure*, which, for interest and beauty, appeared to me (though among so many bewildering attractions I hardly know whether or not I am right) the gem of the whole collection. It is a necklace, stomacher, &c., composed exclusively of diamonds, but of every shade of colour; the dark blue of the sapphire, the light purple of the amethyst, the orange of the topaz, and the olive-green of the peridot, with many of the most delicate intervening shades, the lightest azure, the faintest primrose, the palest pink, all displayed in various descriptions of diamonds. The stones of which this suite is composed are from the collection of the late Rundell, Bridge, Rundell, Esq., and, possessing, as it does, the double advantage of that diversity of colour obtainable by an assortment of various stones with the lustre and brilliancy to be found in the diamond alone, this set of ornaments is, unquestionably, in its own peculiar walk, utterly unrivalled by any in the Exhibition.

Difficult as the imitation of flowers in gems would appear to be, a still greater ingenuity would seem to be necessary in the formation of another ornament, which will be found on a cushion immediately above the set just described, and which is simply a decoration for the head, composed of fine brilliants arranged in the form of an ostrich feather! The whole appearance of the original, which would seem utterly unattainable in materials of so inflexible a character, is given by an ingenious arrangement of the stones in which they are studded, and thus affording, when agitated by the movement of the wearer, that "swailing of the feather," to use the words of a well-known poet, so beautiful in nature. The mode in which it is displayed does not, however, enable us to form a judgment of the complete success of this charming device. A necklace and stomacher of diamonds on the left is worthy of note, if not for any novelty of design, at least from the size and lustre of the stones. Above it is a head-dress of rubies and diamonds, representing a sprig of roses; the chief beauty of which is its extreme lightness. It would not, however, be the less effective if exhibited on a frame-work of more elegant device than the skull-cap that has the honour of bearing it. Many brooches of many kinds are exhibited, which in any other collection would have called for especial notice; but we have been so richly regaled with the beautiful, that nothing short of some very extraordinary attraction could succeed in awakening a renewed attention. Before, however, quitting this assemblage of the "rich and rare," we must not omit a glance at those large jewels at the extreme left—among them a brooch, consisting of one sapphire considerably larger than a crown piece, and stated to be the finest specimen of its class known. Beneath this, and belonging to it, is a small sapphire set in a knot of diamonds, with another even more beautiful depending from it as a drop; and with this description we must conclude our notice of Messrs. Hunt and Roskell's chief treasures.

The next object to arrest our attention on continuing our walk eastward, is the collection of Messrs. Garrard, of the Haymarket, which in beauty and value is only second to that which I have just left. Before, however, commencing an examination of it, let us turn back for a few moments, and glance at one or two unobtrusive cases, which, in our eagerness for a glimpse of the "gems of price," we have passed unnoticed, and may therefore otherwise altogether overlook.

On the left-hand side, near the outer railing of the Gallery, Messrs. Waterhouse, of Dublin, have devoted a case exclusively to the exhibition of Irish brooches, which, from their peculiarity of design, rather than from any remarkably beauty, are worthy of especial attention. They are composed of gold, silver, and of bronze, ornamented in some instances with malachite and other stones, and designed from antique originals, which the zeal and industry of archæologists have from time to time brought to light in various parts of the sister kingdom. They are for the most part in the shape of the letter O, with the pin running through the centre from top to bottom. There is one of large size, and more elaborate ornament than the rest, which is perhaps most worthy of attention, as being the finest type of the class; it is named the Royal Tara Brooch, from the circumstance of its having been designed from a brooch of extreme antiquity recently discovered near Tara, in the county of Meath: it is of bronze, of circular shape, the lower half is occupied by a variety of ornaments in niello and Irish gems. Beside it is the original brooch from which it is designed, which is in excellent preservation, and testifies to the taste and skill with which the makers have preserved the characteristics of the type, whilst somewhat modifying its details to fit it for modern use. In a case on the right-hand side, Messrs. West and Co., of Dublin, also exhibit brooches of a similar description, but somewhat smaller in size. One of these may be introduced as interesting, from its being composed entirely of native material, the gold being the product of the Wicklow hills, and the stones with which it is ornamented Irish pearls and sapphires. In the same case, a curious fibula, or button, also of Irish gold and gems, is worthy of notice, as having been presented by the Queen of Dublin to Miss Helen Faucit. These ornaments, though rugged in character and heavy in form, have an interest of their own in a sturdy antique Druidical dignity of appearance, which renders them scarcely less attractive than the light and modern decorations by which they are immediately surrounded. Messrs. Rettie and Sons, of Aberdeen, may be said to represent the department of the modern antiques of Scotland, in brooches and shawl-pins, in an adjacent case. Messrs. Martin, Basket, and Co., a little more westward, exhibit, among various ornamental designs, an elegant toilet stand, which they term the Princess Royal Toilet. It is about the size of a small dressing-case; is made of silver and gold enamel, and is ornamented with delicate golden butterflies. The small looking-glass attached to it is framed in silver and gold; and the whole is one of the most elegant little *bijoux* for a little lady that could well be imagined.

Let us now return to the jewellery of Messrs. Garrard. In the centre will be found a beautiful tiara of diamonds, with drops composed of fine pearls, and a Sevigné to match. Beneath this is a suite of opals, set with brilliants, comprising necklace, stomacher, ear-rings, and bracelets. The opals are twenty-five in number, of unusual size and great beauty, being, with the exception of one in the necklace, entirely without flaw, and presenting, under every fresh phase of light, all the most delicate colours of the prism. These are, unquestionably, the finest of this description of stone to be met with in the Exhibition. On the right is a delicate suite—necklace, brooch, and bracelet—like the coronet of Sir Pelamon of the Lapsed Hundred.

With sparkling diamonds and with rubies set.

The specimens of the latter stone are more than ordinarily large and beautiful, and the whole is noticeable for extreme elegance of design. On the left side we observed a similar *parure*, somewhat larger and heavier in character, of sapphires, diamonds, and pearls. Beneath which is a bracelet, which I notice chiefly from the apparent popularity of its pattern several of similar character being exhibited in other parts of the Building. It consists of a series of broad rings of diamonds, interlaced one in the other, increasing in size till they reach the centre, which is filled by a large ruby. On the right side of the case is a pearl drop of remarkable size and regularity of appearance; but possessing an interest tenfold beyond its actual value, in the circumstance of its being a relic of one of the most distinguished women that ever lived. It is stated to have belonged to the Spanish Queen Isabella of Castile, the steady friend and patron of that great man, whose his epitaph expresses it, for Castile and Leon discovered a new world Christopher Columbus. It is now the property of the Marquis of Abercorn. Near this gem is a Sevigné of diamonds and emeralds, with drops of the latter stone, and some elegant bracelets of various devices, one of which will be noticed as containing an oblong ruby of remarkable size and purity of colour. The collection of Messrs. Garrard, on the whole, though less extensive than that of Messrs. Hunt and Roskell, contains as may be seen, some objects of unusual interest; and the lightness and elegance with which they are arranged seems to me to give them more than a character which we shall have occasion to admire in the French department, than perhaps will be found in any other case in the South-western Gallery.

Among the wealth of plate exhibited by Messrs. Emanuel (119) will be found a few ornaments also, two of which especially (though of somewhat formal design) struck me particularly as the one a bracelet composed of broad rings of diamonds interlaced one in the other, similar to that I have noticed as exhibited by Messrs. Garrard, with an oval emerald of great size and lustre in the centre; and a small diamond-shaped brooch, divided into chequers of pure rubies, each square by the other by rows of brilliants, having something of the effect of a harlequin's coat. The admirers of the deep rich colour of the carbuncle will find two fine specimens in a brooch and pendent in this collection. A bracelet is also exhibited of plain gold, interesting from the circumstance that by side it are placed specimens of the gold of which it is made, in its various stages, from its original state to the links worked up and completed for the bracelet. First the ore, unremoved from the rock; then the fine gold, the virgin gold, and the pure gold. The observer will not fail to remark the deterioration of the metal necessary to fit it for working up into forms of elegance for the wearer.

The next objects claiming notice are those belonging to the Messrs. Rowland, which, although they comprises but four or five ornaments, and the stones composing them are not remarkable for peculiar beauty, the arrangement and designs are so infinitely superior to any we are in the ordinary habit of seeing as to arrest immediate attention. The first object is a bracelet, set with rubies, in gold, distinguished by the exhibitors as the "Holbein Bracelet," and displaying much of the character we are in the habit of noting in the pictures of that period. The rubies are arranged in three rows of what are termed, in heraldry, lozanges, each surrounded by a narrow border of brilliants. So far as regards the style of design, this bracelet has few equals in the Exhibition. There are three brooches in this way hardly less beautiful, one of which has a large carbuncle for its centre decoration, surrounded by brilliants, supported by little Harpids, and surmounted by a guardian angel with outspread arms. Another bracelet seems designed from a lady's stomacher, also of rubies, and is very elegant. This small collection is perfect of its kind.

The Messrs. Morel exhibit a bouquet of flowers of brilliants and rubies, the elegant arrangement of which will be familiar to our readers, from the Engraving lately given of it in the ILLUSTRATED LONDON NEWS.

Having attempted to do justice, however imperfectly, to the claims on our admiration afforded by the taste and ingenuity of our own countrymen in this department, let us now proceed to the eastern end of the ground-floor, where our Continental neighbours display their treasures. On the southern side of that quarter will be found the collections of the French jewellers; and to them, as the nearest and most important, we will first direct our steps.

Looking upon the Nave, a short distance beyond the Swiss department, is a small case of *bijouterie* exhibited by the Messrs. Leimonter, of the Place Vendôme, Paris, which is familiar to most persons as being the depository of the jewels of the Queen of Spain, and which, from its favourable position, no less than the exquisite beauty of its contents, has been one of the most attractive displays in the Building. It is, however, just now entirely hidden from our sight by the crowd of eager admirers that surround it. The ingoring enthusiasm of the beautiful who stands before us seems tempted to encroach somewhat on the time strictly due to her neighbours; but who can resist the pathetic appeal of that prince of guardians, in the guise of a policeman, who stands at that left-hand corner. So as we have frequently imitated the Parable, and first approached the last, the last shall be first, I will commence my review of the contents of this case with the one on the left. The first object we shall notice will probably be that tiara of sapphires surrounded by brilliants, which we noticed in the case interspersed with pearls, which is exhibited to advantage on a velvet helmet on the left-hand side of the compartment. There is something peculiarly beautiful in the deep pure blue of the sapphire, and as, from some cause or other, we seem to see it less frequently imitated than the diamond and the emerald, it possesses a freshness which gives it a peculiar attraction. The specimens of this ornament are remarkable for their size and lustre, and, with the exception of the sapphire exhibited in a brooch by Messrs. Hunt and Roskell, to which I have before alluded, are probably the finest examples of this stone in the Exhibition.

Our attention now turns to a *parure* of higher value, and, it must be admitted, of even greater beauty. It comprises, first, a bouquet consisting of diamonds in the form of flowers, something similar in character of arrangement to that which I have already noticed in the Royal bouquet, but set with a drooping springy lightness peculiar to itself. The flower-buds are composed of pearls, and the leaves of emeralds, the whole seton springs so quiveringly tremulous that every movement presents them in a new and more beautiful point of view. So large are the emeralds, that, but for their intrinsic brilliancy, they might at a distance be mistaken for some new kind of enamel of peculiar beauty. The gathered stems of the flowers are apparently confined together by a ribbon of diamonds. Near this exquisite ornament, and forming part of the same suit, is a head-dress of emeralds of the same extraordinary size and beauty, surrounded by pearls and diamonds, and comprising, it is said, upwards of 8500 stones. A bracelet, necklace, stomacher, and shoulder-knot complete the suit. Before yielding our place, we must take a glance at that bracelet, composed of two precious stones, which, from the extreme beauty of their colour, have been generally mistaken for rubies, and have been thus described in more than one journal. They are, however, not rubies, but carbuncles of remarkable size and excellence, and are stated to have been purchased by her Majesty. A brooch and pendent of pink pearls in the same case are also worthy of notice.

Having finished my survey of the Spanish jewellery, I next turn to that exhibited by Froment Meurice, of Paris, who also displays a bouquet of smaller size than the one to which I have alluded above. It is composed, entirely in diamonds, representing roses full blown and in bud, the petals of which have a mixture of rubies among them. The convolvulus, so effective in every style of decoration, and the pendent fuschias, with their ruby drops, are of remarkable beauty; the usual ribbon of diamonds, with three tassels, complete this ornament. Near it a brooch, to match, is to be seen, composed of flowers full blown. In the same compartment will be found a Sevigné of large pearls, representing grapes, with leaves and drops of diamonds. The admirable manner in which the irregular and rounded appearance of the leaves (as in nature) is represented is especially worthy of remark. A brooch of rubies and brilliants, in the form of a carnation, with buds and leaves, in the same collection, is also exceedingly effective.

There is another object exhibited by the same firm, which occupies deservedly a prominent a position that it will probably attract the eye, even before the specimens of jewellery of which I have been speaking. Though professing to come within the category of the useful, it is so essentially ornamental in character, and appeals so directly to the taste and sympathies of ladies in general, that I cannot make up my mind to pass it by without a few words of description. This is a toilet taule, silver gilt, adorned with carving and enamel, and presented by the Royalists of France to the last direct female representative of the good King, Henri Quatre, the Duchess of Parma, on her marriage. The various articles comprised in this toilet are a mirror, two jewel caskets, a ewer and basin, two girandoles, and the table itself. The mirror, in the form of a Gothic arch, is set in an ornamental frame of the *Renaissance* style, round which are enamelled the arms of all the ancient provinces of France. On the right and left are the supporters of France and Lucca, bearing the banners and devices of their respective countries. The supporters are represented as leaning against two giant lilies, at the base of which are groups of young children. The inscription—"Souvenir de France, 10 Novembre, 1845"—is engraved on the lower edge of the mirror. The jewel caskets are ornamented with twenty enamel portraits of women most renowned in the annals of France; among the number who have been deemed worthy this honour may be instanced Jeanne d'Albret, Joan of Arc, Ste. Geneviève, Blanche of Castile, Anne of Brittany, Jeanne la Boiteuse, and Anne of Beaujeau (so well known to us through the pages of "Quentin Durvard"), Ste. Bathilde, Jeanne de Montford, Jeanne Hachette (the peasant preserver of Beauvais), Clemence Isaure, and Margaret of Valois. At the corner of the caskets are placed statuettes of eight youthful pages, representing the flower of French chivalry, whose individual likenesses have in each instance been preserved as far as possible, all of which have been taken from authentic portraits. The design of the girandoles is of remarkable beauty, representing clusters of lilies, round which are entwined garlands of roses, and "ivy never sere." The table itself must by no means be forgotten, although its many beautiful accessories deprive it of some share of the importance due to it in the mind of the beholder. Its length is about six feet; its outer surface is composed of large silver plates enriched with gold, placed in incisions expressly made for the purpose in the single plate of steel which forms its foundation. Its ornaments are *fleurs de lys*, roses, and ivy; and on a ribbon is inscribed the circumstances under which it was presented. Most grateful must such a *souvenir* have been to one whose earliest years were passed in exile from her native land, and to those first remembrances must have been the sorrows of her family. Four years were, it is said, employed in the construction of this magnificent piece of workmanship. Its estimated value is about £6000.

Madame Rattée, of the Rue Pavée Ste. Sauveur, Paris, exhibits a bracelet, composed of three rows of diamonds, set clear, diminishing in size as they approach the centre, which is filled up by a large ruby encircled by brilliants. This work, though not ornamental, is said to contain ninety-two diamonds of great value.

The case of M. Bouvenet, of the Rue de Hauteville, contains some very charming specimens of enamel, particularly a bracelet, with earrings and brooch to match, in imitation of twisted ribbon. Also a Sevigné of blue enamel, adorned with long pendents set with diamonds, which hang down to the point of the dress, and which can be removed at pleasure, and formed into brooch, bracelets, hair-pins, and ear-rings. A bracelet of the plain old Greek pattern, so popular at the beginning of the present century, and so beautiful in itself, will also claim a passing glance.

Crossing the Nave, and entering the department of the Netherlands, we approach the small case (104), of M. de Romain, of Rotterdam, the only exhibitor of ornamental jewellery of Holland. We here meet with a magnificent corsage or *potato* of diamonds, representing bunches of flowers, in the centre, ornamented with the finest beautiful pearls, in a small medallion portrait of her Majesty, in her robes of state, very finely executed; from which depend four chains of diamonds. By fastening these chains to the principal ornament, a *cofjure* is obtained for the head; and, by another transposition, the whole may be changed into a *chatelaine!*—perhaps the most valuable that was ever constructed. On the whole, it is a beautiful piece of jewellery, though of rather a heavy character.

Our next visit is to the Russian collection of jewellery, with which we must conclude our notice, and which, though not very extensive, presents attractions of no common order; among which, a magnificent tiara of diamonds and emeralds must be especially particularised, the latter stones of which are of large size, and beautifully smooth and round, but, not very unlike the shape of a rose-bud. This comparison may serve to give an idea of the setting; for, as a rose-bud is attached to its stem, in like manner are these beautiful stones attached to the sprays of which they form the accessories. This clear style of setting, objected to by some persons as rendering the jewels lighter in colour, enables us better to see and appreciate their size and quality, and adds to our confidence of their high perfection. The other *parure* in this case, of great beauty, is a necklace of diamonds and rubies, represented by large drooping bunches of currants, the leaves of which are diamonds. There are also two diamond sprays for the bosom, representing the elegant convolvulus, with its heart-shaped leaves and twisted tendrils. It is almost superfluous to add that their value is pronounced to be immense.

In search of further elegances of form and description, we have no long space to traverse; for in one of the rooms appropriated to the Zollverein we meet with a rich assortment of bracelets, brooches, &c., which, although presenting a less striking *coup d'œil* than those above alluded to, offer individual specimens decidedly worthy of attention. A brooch and ear-rings *en suite* (No. 140) are rather peculiar in design and of great elegance: each ornament represents a grape-leaf, about an inch and a half in size, which is closely studded over with small rubies of varying shades of colour, reminding us of the original leaf in its half-faded state. It struck me as remarkably novel in design. Another beautiful set, of gold, opals, and green enamel, is very striking; though two massive bracelets of frosted gold claimed a longer look of admiration than many later rivals of higher pretension. Some chief adornments of one is that of two oak-leaves entwined together, between which are two acorns of single emeralds. The part that encircles the arm is supposed to be a small twisted oak branch, so perfectly is the original idea carried throughout. The companion bracelet is entirely of gold, wrought into a broad band, from which a little Cupid seems struggling to free himself. A brooch, representing a combat between a lion and a serpent, set with diamonds, should also be here particularised. A small round case (31) contains much that is beautiful; one division of it is appropriated to brooches of plain gold, generally of twisted forms; another is of the same description of ornament, with red coral introduced. Where all are so deserving admiration, it is difficult to distinguish the most beautiful; but one, representing a large serpent, is remarkable for its great resemblance to nature: it seems to have coiled itself naturally, but most artistically, round a very picturesque branch of coral. Another bracelet represents a serpent and lizard: the latter is so perfect in form and colour, that a lady must be endowed with a strong love of the odd and curious in jewellery not to feel a shrinking repugnance in placing it on her arm. It is worthy of minute inspection, from its singularity, if not for its beauty. I could almost fancy it to have been the cherished ornament of some Egyptian priestess. Many beautiful ornaments for the person in oxidised silver are scattered over various parts of the Exhibition, to which we have only room thus cursorily to allude; and in taking our leave of the jewellery therein exhibited, it is with a conviction that so varied an amount of treasures of this description can never again be collected under one roof, either in our own or in any other country.

GROUP OF CHINA.—BY MESSRS. DANIELS.

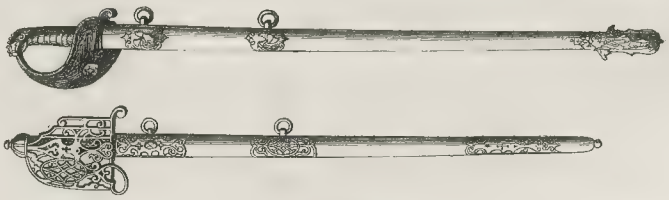
GLASS.—BY J. NAYLOR, PRINCES-STREET.

PORCELAIN. EXHIBITED BY DANIELLS

The manufacture of porcelain is of comparatively recent date with us; it being not yet a century since Mr. Cookworthy, of Plymouth, after drawing attention to the great clay deposits of Cornwall, eventually removed to Worcester, where he established what has since grown into a highly important branch of manufacture. The displays of British porcelain, both of the tender and of the hard or semi-vitrified kind, are abundant and extremely interesting, whilst they are in the highest degree creditable to the industry and enterprise of their producers. In our present Engraving we give a group of different objects exhibited by Messrs. Daniells, executed for them by Messrs. Rose, at the Colebrook Dale china manufactory. Messrs. Rose have had the good fortune to discover the once-celebrated rose Dubarry, a pale pink employed upon Sèvres chins, and so called after that favourite mistress of Royalty. There are several beautiful specimens of this delicate colour in the works before us, intermixed with other colours and gilding in the richest profusion. The forms of the various articles are, for the most part, extremely elegant. (See also page 127.)

CLARET JUG AND GLASS. BY W. NAYLOR.

Amongst the very handsome display of table glass sent in by Naylor, of Princes-street, is a claret jug and glass, cut in devices in honour of the Prince of Wales. The manufacturer has sent us a detailed description of these articles, which we may as well give in his own words, as a matter of historic curiosity in connexion with the Exhibition:—"In the centre of jug his Royal Highness the Prince of Wales, in sailor's attire, leaning against a rock, which represents the firm foundation o Briton. In his left hand he holds the British flag, in his right hand the full blown rose, representing England. At his feet is a dog, looking up to the Prince, denoting the confidence and fidelity of British subjects. To the left of the Prince is an oak tree, in full bloom, with the ivy clinging to it, showing the strength of the English constitution, and the attachment of the people towards it. The rays shining upon, and the hand from behind the tree dropping a wreath of laurel, denote the eye of Providence smiling, and the hand of Providence crowning the Prince with prosperity. On one side is a wreath of grape-vine and laurel, emblematical of the flourishing and victorious state of the



SWORDS.—BY REEVES, GREAVES, AND CO., BIRMINGHAM.

SIDEBOARD.—BY MESSRS. JOHNSON AND JEANES.

country, anticipated during his reign, in the centre of which is his coat of arms Opposite is a wreath of oak and ivy, denoting the stability and devotedness of the English people. In the centre of this, a group of rose, shamrock, and thistle firmly tied, representing the union of the three kingdoms, descending upon which is a dove with an olive leaf, denoting peace with the world. In the centre of neck, a bunch of forget-me-not, the remaining part of neck filled up by a leaf from every plant represented on the jug." We have only to add, that the glass employed is of first-rate colour and quality, and the workmanship unexceptionable.

SWORDS. BY REEVES, GREAVES, AND CO.

Messrs. Reeves, Greaves, and Co., of Birmingham, exhibit a large assortment of swords of various kinds, intended for general use. They are extremely well manufactured. The two which we engrave are a Scotch claymore and an ordinary cavalry sword.

SIDEBOARD. BY JOHNSON AND JEANES.

The mahogany sideboard exhibited by Messrs. Johnson and Jeanes, of Bond-street, is a very handsome production, of admirable workmanship. The supports are boys, with grapes, &c., resting respectively upon a lion and a tiger. The mouldings along the edges are very bold, and carefully finished.

IVORY THRONE, &c. EAST INDIA COMPANY.

This magnificent throne, of carved ivory, is one of the chief attractions, recently added, of the East India Company's tent. The carving, both back and front, is most elaborate, and of exquisite finish; the seat and back being covered with rich green velvet embroidered in gold. The footstool is of like materials and workmanship. The chairs on either side are beautiful specimens of Bombay carving, in blackwood, the boldness and lightness of which are equally remarkable

IVORY THRONE, EXHIBITED BY HER MAJESTY; AND TWO CHAIRS OF BLACK-WOOD, IN EAST INDIA COMPANY'S TENT.

GIRL PRAYING. BY J. A. M'DOWALL, R.A.

This is a pleasing little subject, agreeably treated in marble by Mr. M'Dowall. It stands in the South Transept.

PARIAN. BY ROSE AND CO.

In addition to the porcelain by Messrs. Rose and Co., of Coalport, represented in the opposite page, we have engraved their large group of "Pleiades adoring Night," which we have already characterized as elegantly treated (See page 127) On each side of the group is an ornamental piece of the same beautiful material, both of elegant design.

HOLTZAPFFEL'S LATHES.

In addition to the numerous beautiful specimens of turning contributed to the Great Exhibition by Messrs. Holtzapffel and Co., and which we alluded to in a former notice, this eminent firm has recently added a valuable rose engine, for ornamenting turned surfaces, and also a lathe for ornamental turning, both of which are now shown in operation in the Machinery in Motion Department. It is rather singular that there are no other machines at work in the Crystal Palace applicable to this peculiar branch of art. The rose engine is very completely fitted with a variety of apparatus, such as a compound sliding rest, segment engine, oblique motion, eccentric, oval, straight-line, spherical, geometric, and many other chucks; which are employed either independently or in combination with each other, with or without the rose engine movement, which in itself is a prolific source of elegant embellishment. The results of these combinations present infinite variety of most curious and highly ornamental patterns, somewhat similar to those of ornamented watch-cases, but of a much more elaborate description.

The lathes for ornamental turning exhibited by the same house are fitted in an equally complete manner, not only with the various chucks already mentioned, but also with other apparatus, as vertical, horizontal, universal, eccentric, and elliptical cutting frames. In this class of instruments the tools revolve, while the work under operation remains stationary; being the opposite condition to that usually observed in ordinary and rose-engine turning. In some instances a still larger amount of elaborate work is produced by putting both the work and the tool in motion at the same time. And when, in addition to these powers of combination, it is considered that the tools themselves are made in every variety of form, it will easily be conceived that the apparatus is capable of producing an unlimited number of different figures, applicable both to the production of forms and the embellishment of surfaces.

We especially call the attention of visitors to the Crystal Palace to the numerous beautiful specimens, exhibited by Holtzapffel and Co., of ornamental turning, as executed by various amateurs, comprising

GIRL PRAYING.—BY J. A. M'DOWALL, R.A.

PARIAN.—"THE PLEIADES ADORNING NIGHT," ETC.—BY MESSRS. J. ROSE AND CO.

temples, mosques, pagodas, candelabra, vases, jewel-cases, work-boxes, and many other useful and ornamental articles, which illustrate at the same time the taste and skill of their respective authors, and the excellence of the mechanism by which they were produced.

Although of far less importance in a mechanical point of view, the compact arrangement of the several parts, and the general finish of the entire apparatus, is worthy of notice. The lathe frames are substantially made of polished mahogany, with nests of drawers, in which are placed the tools most frequently required for use; and when not required for use, the whole is secured by a cylindrical cover.

CHEMISTRY.

(FOURTH NOTICE.)

RETURNING to the Great Exhibition for another batch of chemical suggestions, we notice the glass extremities knocked out for the sake of establishing a better ventilation, a function which appears to have been inadequately provided for by the constructors of this edifice. Ventilation has been designated by the German traveller, Kohl, as one of the favourite crotchets of the English, and many amusing jokes he makes on this peculiarity. Well, we own to the crotchet, if crotchet it be—of advocating a very perfect ventilation. There is something in the constitution of an Englishman which abhors foul, used up, vitiated air, as nature before the time of Galileo was said to abhor a vacuum; and he can no more bear, without subjecting himself to a head-ache, the close stoves of the Germans, Belgians, and especially Russians, than a trout can bear salt water, an ancient coquette the reflection of her wrinkles, or Colonel Sibthorpe the Exhibition. The fact is, we are trained to appreciate a good supply of air from our very infancy, by the nature of our open fire-places; so that any accumulation of vitiated air becomes painfully oppressive.

Singularly enough, we find, on examining the contributions to the stove part of the Exhibition, a foreigner coming forward to aid the English in perfecting the resources of an operation, which they themselves, it might have been anticipated, would have been the first to have exhausted. The common English fire-place—all cheerful, glowing, and comfortable as it looks—has many disadvantages. In the first place, it is terribly wasteful, and burns away coal with the greatest disregard of economy. Of this we won't say any more, because Geologists tell us there is coal enough in England and Wales to last at least two thousand years at the present rate of consumption; and unselfish as we are, within any moderately assignable bounds, we don't care nor profess to care how people are to warm their toes, cook their steaks, boil their tea-kettles, or smelt their tin, two thousand years hence. In the second place, our fire-places, in their strong endeavours to promote ventilation, pull large volumes of cold air most uncomfortably against our backs, or, rather, feet; whereas, inasmuch as people don't breathe by their toes, but by their mouths and noses, our fire-places do not offer a fair amount of ventilative retribution for the chilling of our feet and backs. Some of these disadvantages have been provided against by a foreigner, M. Noirsain, who has come forward to minister to our national ventilative crotchet. We observe stoves, in shape something like cabinet pianos, and so constructed, that by opening little trap-doors here and there, the ventilative agency may be diffused.

Most persons have noticed the different properties of various kinds of heat on the human frame. Who has not wandered occasionally into those lower regions of metropolitan houses sacred to the culinary mysteries of the cook? Who has not seen, when thus wandering, the kitchen stove, all red hot and glowing bright as the fire which it contains, and ready to burst into flame itself. If only the atmosphere could be induced to feed it with a little more oxygen? Who, under these circumstances, has not felt a painful contraction of the skin of the head, a dizziness, a general feeling of suffocative oppression? The fact is, that heat, distributed from glowing hot surfaces, is most painful and unsalutary. No mere mixing, no tempering down of air which has once been heated very hot, can ever make it agreeable to the lungs. It may have been the fortune or fate of some who read this sketch, to wander into the Long Room of the London Board of Customs: we do not know whether the stove that stood there ten years ago exists at this day; we speak of the past when having understood to say that the warming apparatus called the Long Room stove would have affected a fitting companionship to the brazen bull presented by an ingenious Roman artizan to the gentle Caligula, and into which victims being put, and fire applied, the machine emitted roarings like a veritable animal. The Customs stove would have gladdened the heart of a Torquemada for an instrument of slow torture; and its presence in the Customs department would hardly be defended by the most rancorous enemies of that celebrated branch of the fiscal service—no, not even by the Charlotte-row merchants committee of customs reform, or the manager of the London Docks. Now, the reason why the heat given off from the Customs stove was so oppressive in its character is simply this. Its construction was dictated by the false and unhealthy principle of heating very intensely a small volume of air, and of finally obtaining the proper breathing temperature by mixing the hot air with cold. This is essentially bad, unphilosophical, and incorrect. Did you ever burn a feather, or a bit of wool or silk, and notice the disagreeable odour resulting? A parallel effect to this is brought about by heating air to an inordinate temperature. The atmosphere is full of little animal and vegetable particles, which in a sunbeam may be seen floating about in countless myriads; and, besides this, the air contains animal and vegetable emanations, which, although invisible, are capable of being burnt, and of producing that unpleasant empyreumatic odour we have described. Hence it follows, that ventilation being provided for, the next great desideratum to be aimed at is a large heating surface, so that the atmospheric emanations may not be terrified as we find to be accomplished by the Customs-house stove.

The plan of ventilation proposed and carried out by Dr. Reid is merely an extension of the principles of an open English fire-place. This gentleman, by lighting large fires in certain allotted places of the buildings, he desires to ventilate, establishes a draught from various directions, and thus accomplishes his ventilation. It will be easily recognised, that Dr. Reid's principle of ventilation requires every part of a building to be hermetically inclosed, except to the orifices of his ventilating tubes; and hence it is, that when this principle has been adopted, the nailing down of the windows has been imposed as a matter of necessity. Somehow or other, a long and noisy string of complaints have arisen against the Doctor's ventilating schemes; and now the proposed plan of Mr. Goldsworthy Gurney begins to be in the ascendant. This gentleman takes advantage of the property which high-pressure steam has, when blown into an orifice, of carrying before it large volumes of atmospheric air. In this way he not only proposes to ventilate the largest buildings, but also to maintain a constant purity of atmosphere in our largest, most complex, and most dangerous coal-mines. By the way, this very ventilating steam jet of Mr. Gurney is now largely employed as a means of injecting atmospheric air into furnaces. In this way we have seen it used in a silver cupelling furnace; and this fact crossing our brain, reminds us that we are in some measure pledged to a chemical account of the metal silver, which, accordingly, we will describe as soon as we have discussed a subject still more immediately suggested by radiation, namely, the subject of heat.

It is strange enough, that heat, although constantly affecting our sensations, is enveloped, so far as its intimate nature is concerned, in the most impenetrable mystery. With a show of making things plain, philosophers have made a distinction between heat considered as an abstract principle, and the sensation to which it gives rise; the former, whatever its nature, they term caloric, and the latter simply heat. Others, again, have adopted the plan of describing heat under the two names of latent or hidden, and sensible or evident heat; but this distinction does not make the matter much clearer. Our means of measuring heat are indeed meagre and imperfect: as to our sensations, they are fallacious in the extreme, and the thermometer affords us a range of indications much more narrow in extent than people are apt at first to think. The principle of the thermometer is simply this. Bodies expand, as is well known, by being heated, as many a thrifty housewife has before now discovered, when unable to put in its place the red hot iron of her Italian heater, although it fitted perfectly well when cold. Such being an effect of heat, then, it is quite easy to conceive, that if mercury or spirit be put into a bulb communicating with a very narrow tube, the liquid on expanding by heat must rise, and on contracting by cold must fall. This is the common principle of the thermometer—details we mean to discard, with the mere summary observation, that the markings on a thermometer stem are purely arbitrary, and may be great or small just as suits people's fancy, provided their exact conventional value be properly pointed out. We will not even tell the reader in this place how the mercury or spirit got into the glass bulb and tube, seeing that in the thermometer it is absolutely closed up on all sides; neither will we tell our curious inquirer why it is that water will not do for the thermometer-making liquid. All these answers must be sought in books of chemistry. One thing, however, connected with thermometers is of such practical importance that we may not slur it over. It is too common for people to choose thermometers—not as the Vicar of Wakefield chose his wife, and as she chose her wedding gown—because they promised to wear well—but because of an elegant-looking exterior with which thermometers are often accompanied. Now, people who indulge in these pet thermometers cannot be too firmly imposed with this fact, that once a thermometer tube becomes broken, there is an end of the whole apparatus; the scale was made for a specific tube, and will do for no other. This philosophy, depend upon it, is correct, although, should you happen to have a broken thermometer, and send it to be mended to some of those elegant-looking shops, in the regions of Saffron-hill, the philosophy we have inculcated will not be taught you there. Whether it is from politeness and desire to oblige, we cannot tell; but this much is certain, that many thermometer-makers will favour a customer by adding a second tube to an old scale. We don't mean to say that any of the exhibitors would do such a thing; present company, of course, is always excepted from obnoxious strictures.

But to return to the thermometer, of which we were saying that the amount of information conveyed by it to us was really very small. First of all, it gives no indication of that kind of heat which cannot be felt; of which proposition we can cite a very easy proof. On some cold winter's day, when the atmospheric temperature has sunk considerably below the freezing point, which is 32—has sunk, we will assume, to the temperature of 28—let us suppose the bulb of a thermometer to have been frozen into a mass of ice. If then the thermometer be a good one (not such an instrument as we have described as made with a new tube and an old scale), the degree indicated will be, as we have said, 28. Matters being in this state, if the mass of ice, with its imbedded thermometer buib, be put into a saucepan and heated over the fire, the thermometric liquid will gradually rise. Nothing so extraordinary this, it will be rejoined; it ought to rise, because the ice must necessarily be getting hot. Very well; but presently the degree reached is 32, the degree at which water freezes, when, curiously enough, there the thermometer stands; in vain we urge the fire, in vain the saucepan and ingredients become hot, there stands the thermometer at 32, and there *it continues to stand* until every particle of the ice has become melted, when, tired of its obstinacy, it begins to rise again. Now, from this experiment it is quite clear that the thermometer is incapable of indicating, much less measuring, the heat which enters into melting ice. This is one of many cases which might be cited to prove that the thermometer is totally incompetent to measure latent or hidden heat. Indeed, its measurement of evident heat is not a measurement of quantity, but of intensity, as we can easily make appear. Thus, a quart of boiling water must necessarily contain more heat than a pint, notwithstanding that the thermometer indicates the same degree for both.

Having thus shown up some of the imperfections of the thermometer as heat measurer, as it calls itself—we will very quickly dispose of heat, seeing that we do not mean to go into the recondite philosophy of latent heat, but intend confining our remarks to the phenomena of heat as commonly understood. There are three methods by which heat distributes itself, and these we shall now proceed to take notice of. They are termed *conduction*, *convection*, and *radiation*; and may be thus explained. If we take a poker, and thrust it into the fire, it needs no philosopher to say that the end in contact with the fire will become very hot. If the poker be to remain for a certain time in the fire, the other end or handle will also become hot, thus proving that heat has been really *conducted* from one end of the poker to the other; and if by chance a copper bar had been substituted for the iron poker, the conduction would have been more rapid still. Thus we have an illustration of the first of the three methods by which heat distributes itself. We learn also, that copper is a better conductor of heat than iron; and were we to employ bars of various other metals, it is evident a comparative scale of conduction could be easily determined and laid down. The second means of heat distribution, viz. convection, depends upon the property possessed by heat of causing bodies to expand, and, therefore, to become specifically lighter than those around them. Convection is a means of heat distribution that only takes place in liquids or gases, as will presently be made to appear. Let us take atmospheric air as an example: not only will it afford us a good illustration of the process of convection abstractedly considered, but it will show us the reason of draughts in chimneys, of the action of fires and looms, and will explain the nature of trade-winds; so intimately are the phenomena of physical science combined with each other.

The starting point for the illustration of all this philosophy may be variously chosen. For our part, preferring simple experiments to those which are abstruse, we shall desire our readers to summon imagination to their aid, and fancy themselves little boys and girls, wiling away a few stray minutes in the blowing of soap bubbles. Some burst at once, and of them we can learn nothing; others mount up into the air, when, gradually collapsing into smaller dimensions, they come down again. Why did they go up? why did they come down? The answer to these questions will plainly lay open to us the whole philosophy of draughts in chimneys, of fire-balloons, and of winds. In the first place, it is quite reasonable to suppose the bubbles did not ascend merely a gas of specific lightness they might have contained. The breath, as it comes from the lungs, is largely charged with carbonic acid—a gas so much heavier than air, that it may be poured like a liquid from one vessel to another; but this carbonic acid coming from the lungs is also expanded into proportions of such increased size, that it becomes for the time lighter than the atmosphere, and therefore the soap-bubbles containing it ascend, until cooling by their flight the natural weight of the gas comes into play, and they descend to earth again. Now, whether this gas had been contained in soap-bubbles or not, it would, on being heated, have ascended just the same, carrying with it the heat by which its expansive and ascending power was acquired: for this reason, hot air rises in chimneys, and cold air rushes in to take its place, giving rise to what is termed in ordinary language a draught.

Winds are nothing more than gigantic draughts; and of all winds, the trade wind, being most constant in its action, is the best we can fix upon for an illustration. Inasmuch as the tropical regions are hotter than the temperate and polar regions, so it follows that from the ground plane of the former an ascending current must continually arise; thus soliciting two enormous draughts—one setting in from the north pole towards the equator, the other from the south pole to the same; and thus, were the earth stationary instead of rotating on its axis, the two grand currents of the trade winds would be due south and due north respectively; but the earth rotates from west to east, and consequently it follows that the trade winds blow in the direction of north-west and south-west respectively.

After our experiment of soap bubbles, it will be scarcely necessary to enter upon the philosophy of fire, or Mongolfier balloons, which derive the latter appellation from the name of the inventor M. Mongolfier. Instead of being little soap bubbles closed in all directions, fire-balloons are supplied with an open neck, under which is burned some material best adapted for the intended purpose. In the present day fire balloons are mere toys, but originally they were made sufficiently large to take up aëronauts. When first employed, the principle of their ascending power was so ill understood, that *smoke* and *hot air* was imagined to be the ascensive principle; accordingly, a favourite fuel was a mixture of wood and chopped straw.

So much, then, for the property of convection as applied to gases; that it also applies to liquids, needs scarcely to be pointed out, such being a matter of the most self-evident necessity. We may, therefore, at once say a few words about radiation, and bid adieu to heat. If the glowing hot poker be taken from the fire, and the hand or a thermometer be held below it, a manifestation of heat downwards will be evinced. This sort of heat distribution clearly cannot be dependent on either of the two agencies already described; not by conduction, because there is no solid to conduct it; not by convection, because convection would have acted upwards: there is another means of heat distribution called *radiation*, from the word *radius*, a ray. In this way, light and heat present some remarkable analogies; and in this way we receive our heat from the sun.

Thus ends all that we shall say, at least now, about heat.

COAT OF MAIL. BY WILKINSON AND SON.

The coat of mail, of steel chain armour, exhibited by Messrs. Wilkinson and Son, is interesting as showing what can be done in this way at present.

COAT OF MAIL.—BY WILKINSON AND SON.

ARMS AND ARMOUR.

(SECOND NOTICE.)

WE now come to describe the Projectile Weapons in the Great Exhibition; and our first remarks shall be directed towards the various bows which are there found.

Most nations, civilised or savage, have, at one period or another of their history, used the bow; and we, amongst all toxopholites, have, perhaps, been the most justly celebrated. In the Great Exhibition are to be seen many bows of different kinds. We will pass them under review:—

In the Indian department the visitor will see many specimens of bows—some rude enough, and long, the caricature of the shape now used by modern toxopholites; others short, curved, and highly ornamented. The first merit no description; but the second kind should be pointed out as the true Scythian bow, the instrument which has been employed from time immemorial by all the Asiatic tribes from Persia to the West. Its construction is peculiar: the foundation of the instrument is wood; but it is not from the wood that the bow derives its elasticity. This is given by animal tendons laid on the wood wet, bound tightly down, and allowed to dry. This kind of bow is very short, as the observer will see; but the accompanying arrows are taper and long. In fact, the Scythian bow, though short in appearance, yet derives from its double curve a large expansive and contractile play.

Returning to the history of the bow, it is unnecessary to inform the reader that it is mentioned in Scripture, even at so remote a period as is represented in the book of Genesis, where it is said of Ishmael, that the "Lord was with the lad, and he grew and dwelt in the wilderness and became an archer." The overthrow of Saul, it will be remembered, was particularly owing to the Philistine archers; and David commanded that the children of Judah should be taught the use of the bow.

The Greeks had a tradition that the bow was invented by Apollo, who communicated the use of it to the inhabitants of Crete: hence, in later times, the Cretan archers were thought superior to all others. According to some authorities among the Greeks, Perses, the son of Perseus, had the credit of discovering the use of the bow; others attributed this honour to Scythes, the son of Jupiter. All these traditions demonstrate the antiquity of the bow.

The Grecian bows were usually made of wood, but still commonly enough of horn—or rather two horns joined together by a middle piece, which curved as a handle. The latter formed and presented a beautiful combination of curve and straight line, which a highly artistic people preferred to transmit to posterity in their sculpture. It is the real classic bow—the instrument with which Cupid is always painted, but which becomes a very troublesome instrument to make out of any other element than horn.

There were various methods of using the bow. The ancient Persians drew the string towards the ear, as was always the practice of the English, and as is employed by British toxopholites at the present day. The Greeks, however, drew the bowstring towards the breast—and represented the Amazons as doing the same. The tradition of the Amazons cutting off the right breast, in order to give greater freedom in drawing the bowstring, is familiar to all.

With the Romans the bow was never a favourite weapon. Their daring soldiers always preferred the hand-to-hand pilum and doubly-cutting sword. The pilum, strictly speaking, was a projectile weapon, but, as its range was only a few yards, it scarcely merits our notice as such. The pilum was a short and heavy spear; of which weapon every man of the legionary soldiers carried two, which he hurled against the enemy previously to the sword attack. The point of this weapon was very long and small, and hence became so bent on striking an object as to be useless afterwards. This was not an imperfection, but the reverse; since, otherwise, the enemy might, if uninjured, hurl back the javelin with good execution to the quarter whence it came. This information we derive from Polybius; who also informs us that during the Cimbrian war the pilum was considerably improved by Marius, who so fashioned it, that, on striking the enemy's shield, it bent down at an angle in the place where the iron joined the wood, thus becoming totally useless to the party who received it.

Until the period of the second Punic war, the Roman armies were devoid of archers, save those who came with the auxiliary troops: and, though subsequently to the period in question bows and arrows were more employed by this people, yet, so far as we can learn, their use was limited to Orientals in Roman pay. Up to the period of the death of Clovis, A.D. 514, the French did not employ the bow in their military service; but there is abundant testimony to prove that its use was general in France in the reign of Charlemagne, who flourished in the beginning of the eighth century.

The fame of the bow as an old English military weapon is proverbial, though its antiquity in this capacity is not so great as many are disposed to believe. For the purposes of amusement or the chase, the bow was undoubtedly employed both by Anglo-Saxons and Danes, having been derived most probably from Scandinavia; but the military employment of the bow in England dates from the conquest by the Normans. Harold, it is well known, was shot by a Norman arrow; but no mention is made of archers on the side of the Saxons. The Saxon bow, indeed, as we have it represented in a MS. of the tenth century, must have been altogether unadapted for military purposes. Its size was that of a mere toy, and the string, instead of being attached to each end, was allowed to play from two points some considerable distance towards the middle.

Although we know that the battle of Hastings was mainly determined by the Norman archers, we are not informed whether the bows employed were cross-bows—such as are at present used for shooting rooks, being mounted on a stock like a gun, and bent and discharged by mechanical means—or long bows. These, the antiquarian, who afforded such a theme of innocent raillery to Burns, argued the long bow to have been the Norman weapon; others, and, we think, with much greater show of probability, imagine testimony to be in favour of the cross-bow—an instrument which was subsequently employed by France and Continental nations in preference to the long bow, which latter became eventually the national weapon of the English.

About the year 1139 the military employment of the long bow was much extended, in consequence of the arbalest, or cross-bow, being put under a ban by the second Lateran Council as an instrument hateful to

God and unfit to be used amongst Christians. Pope Innocent III. confirmed the prohibition, which was observed under the reign of Louis the Young and of Philip Auguste, but immediately afterwards discontinued both in England and France. Subsequently, Richard I. introduced the cross-bow into our armies, and his death, as all know, was caused by an arrow or bolt discharged from one of these weapons, during the siege of Chaluz, in Normandy—a judgment, as was said, for his temerity.

About the time of Edward II. the use of the long bow in the English armies was greatly extended, although the cross-bow continued still to be employed. About this period, we find the cross-bowman precisely indicated by the word "balistrarius." "sagittarius" being the appellation of the long-bowman. In the reign of Edward III., the long bow may be said to have become the national weapon of the English. This Monarch took great pains to increase its efficacy, and at the battle of Cressy the superiority of the long bow over the cross-bow was well shown. The battle was ushered in by a shower of rain, from the effects of which the bow-strings of the Genoese cross-bowmen in the service of France were so relaxed that the weapons were almost useless; whereas the English long bows, having just emerged from their cases, played with terrible effect. Now the very shape of the cross-bow would prevent its being put into a case; and, moreover, soldiers armed with this weapon could never stand closely together.

Ten years afterwards occurred the battle of Poictiers, in which the part taken by our archers is well known. The sanguinary victory of Homeldon against the Scots was entirely won by English archers, who again did terrible execution at the battle of Shrewsbury, where Hotspur was slain; and at Agincourt scarce a lance was couched or sword drawn.

It was no wonder, then, that the long bow became the favourite English weapon, specially cherished and protected by every British Sovereign from Edward II. to Charles I. Henry VII. altogether prohibited the use of cross-bows; and Henry VIII. renewed the prohibition; indeed, he went further, and passed a statute by which a fine of £10 was inflicted on any person who should have a cross-bow or handgun discovered in his house!

Although the long bow was held in much estimation by the bluff Monarch, yet firearms had by this time arrived at considerable perfection. Even much later, during the reign of Elizabeth, the bow was considered by many a superior weapon to the musket.

Unquestionably the longest arrow flight on record is mentioned in a story told by Pidosit, the Persian Homer, and repeated by many historians of good repute. We will add to these number of narrators, without at all pledging ourself as to the truth of Pidosit's story. In ancient times (so goes the tale), when Mercedonian scholar, the grandson of Pericdon, made peace with Afrasiab, the Scythian invader, one of the articles of treaty was, that Persia should have all the country to the north-east over which an arrow could be shot from Demavend. A hero, named Arish, ascended to the top of the mountain, and shot an arrow to the banks of the Oxus, a distance of between five and six hundred miles! It stands to reason that so long a range must have required a perceptible time; accordingly, the poet informs us, the arrow which was discharged at sunrise did not fall until noon! Now, so extraordinary a shot would seem to relate to long bow practice, but the long bow was not known to the Persians.

The English archers, celebrated as they were in the use of the bow, never accomplished anything approaching to the Persian feat; their utmost range was scarcely more than 600 or 700 yards, and our degenerate modern Toxophilites can only achieve 400 or 500 yards. The Turkish ambassador, when in England in 1795, sent an arrow upwards of 480 yards, in the presence of several members of the Toxopholite Society. His bow was made of horn, and is still in their possession. This was considered at the time a very long shot, yet two or three have occurred since archery has been a pastime which have exceeded it by twenty or thirty yards. There is a tradition that an Attorney of Wigan, in Lancashire, shot a mile in three flights; and a Parliamentary enactment during the reign of Henry VIII. imposes a penalty on any person who, being above the age of twenty-four, shoots at any mark at a less distance than eleven score yards.

And now, before totally discarding the bow, and proceeding to the description of guns individually, it may be interesting to examine for testimony concerning the power of the weapon of our early archers. In their hands the bow was, indeed, no toy, but a weapon of terrific effect, as we have abundant testimony to prove. One of the most interesting cases of the power of the long-bow that we know of is recorded in the works of one William Clowes, a surgeon in the reign of Elizabeth, who relates, as a professional case in his own practice, the difficulties he experienced in extracting the barb of an arrow from the leg-bone of one Master Withepole. It appears that this person went to enjoy an archery review of our good Queen Bess, and, to put himself beyond the range of accidents, he stood a long way from the target—how far away, we are not told. Notwithstanding his care, Master Withepole received a sheaf arrow in the bone of his leg, and it would appear that the soldier who shot him was at least 200 yards distant. A surgeon being on the field of review, the sufferer was committed to his charge, but without avail, for the arrow-head could not be extracted. Eventually, our surgeon author Clowes was called in, who was more fortunate. "I did put down a probe," says he, "into ye bottome of ye wound, where manifestly I did feele ye head of ye arrowe, and I was driven to make a reasonable large incyson down unto ye bottom; whereupon I did put down a dilatorium, to open ye wounde, and so presently I did take hold of ye arrowe-head by a rostrum gruinum!" Unquestionably, doctors were the most deadly of all warlike engines in those days. Mr. Clowes no sooner extracts the arrow, than he writes many stanzas of poetry in glorification of his triumph, and designates the less fortunate surgeon "a treacherous mountagate, counterfeit, land-loper, sophystycall mountebank, cozening quacksalver, and false ingling deceiver, whose bloudy hands, without knowledge, doe hazard the lives of many."

The instance we have given of the power of ancient archery bears the stamp of evident authenticity, and represents a sufficiently terrible effect. Other and more ancient examples, representing the bow in a still more formidable light, can easily be found. Thus, the old author, Giraldus Cambrensis, says, "that certain Welsh archers shot at the oak doors of a portal, behind which a party of soldiers had concealed themselves. These doors were no less than four inches in thickness; nevertheless, the arrows penetrated quite through." The same author also states, on the authority of William de Breusa, that, at a battle where the latter was present, a Welshman, having directed an arrow at a horse-soldier clad in armour with his leather coat underneath, the arrow pierced him through the hip, penetrated the saddle, and mortally wounded the horse. Another Welsh soldier performed a similar feat, with this addition: the man, feeling the wound, turned about, when immediately a second shaft penetrated the other hip, and fastened him to the saddle on that side also, in such a manner that he could not dismount!

The Cornish, as well as the Welsh, were also greatly celebrated for their skill in archery. Carew, speaking of the skill of Cornish archers two centuries back, says, "Their shaft was a cloth-yard in length, and their prickes twenty-four score paces (equal to 480 yards); and, for strength, they could pierce any ordinary armour; and one Robert Arundel, whom I well knew, could shoot twelve score aces with his right hand, with his left, and from behind his head."

Another anecdote of the skill of Cornish archers is related in Hall's "Life of Henry VIII." "There came to his Grace (the King) a certayn man with a bowe and arrowe, and he desired his Grace to take the muster of hym, and to see him shoote; for that tyme his Grace was contented; the man put hys one fote in his bosome and soe dyd shote, and shote a very good shote, and well towardes hys mark, whereof not only his Grace but all others greatly merveyled: soe the Kynge gave him a reward, and for this curious feate he afterwardes obtained the bye-name of One in bosom."

With regard to the comparative powers and length of range of the cross-bow and long bow, it might be assumed that the former, bent as it is by machinery, would excel; such, however, does not seem to be the case. According to an ancient author on projectile arms, the cross-bow would kill at a point blank range of forty to sixty yards, but, if elevated, much farther; still not so far as the long bow. On the whole, it would seem that the cross-bow was more certain of hitting a small mark than the long bow, but would neither project so far nor was it capable of being discharged with such rapidity. Cross-bows usually shot short darts termed quarrels, or *carreaux*, but occasionally bullets, which latter are now universally employed when modern arquebusiers have recourse to the cross-bow for the purpose of shooting rooks.

We will draw our rapid sketch of the history of the bow to a conclusion by stating that the last time cross-bows were used in our armies was in 1627, in the attack on the island of Ré. The long bow, however, remained in use much later. In 1643 a company of archers was raised for the service of Charles I., and the Marquis of Montrose employed archers against the Scots.

One great disadvantage under which both archers and cross-bow men laboured, was their want of means of defence against charges of cavalry. For the purpose of defending themselves under these circumstances they were supplied with sharp stakes, which they planted in the ground, and presented to the advancing troops, after the plan of the modern bayonet. Very late in the annals of military archery, during the reign of Charles I., one Neade developed the use of the bow and pike together; notwithstanding the traditionary affection with which the fletchers (or arrow-makers) and bowyers viewed military archery, the musket was now too far installed for the bow to maintain its standing. The reader must not imagine, however, that the muskets of the time of Charles I. were the effective instruments of our own time; on the contrary, they were heavy and unwieldy; troublesome to charge and discharge, slow to manœuvre, and still more defenceless than the bow against cavalry. When rests were introduced, these who used them were obliged to have carried their ammunition and borne their pieces just as pleased their own fancy. Some used cartridges, some flasks, and all were under the necessity of carrying two kinds of powder—one grained, for the charge; the other, *meuled*, called *touch* or *tutch* powder, for priming. An ancient author on fire-arms employs considerable argument to prove that a properly charged gun should have wadding interposed between the powder and ball; and he expressly informs soldiers that wadding should be lightly rammed down on the ball, to prevent it from rolling out. In the reign of James and Charles I., an appendage called the bandelier was introduced, for the purpose of carrying the musqueteer's ammunition. It consisted of a belt, from which hung down various charges of powder and ball. Thus the soldier was spared some trouble in charging his piece, but was, at the same time, exposed to the danger of having his bandelier take fire.

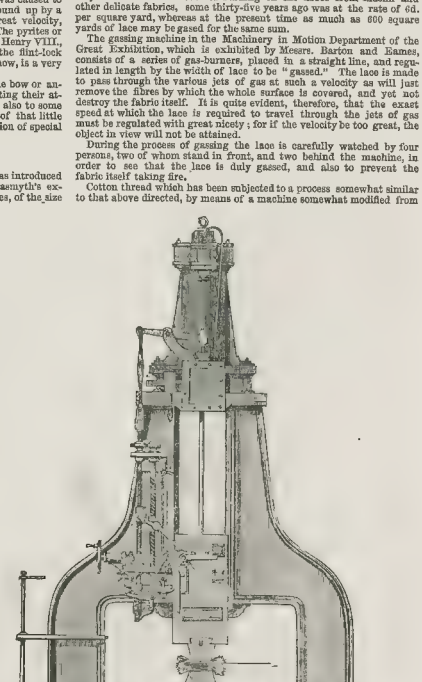
The Spaniards, under Philip II., are said to have been the first to employ small fire-arms in the year 1556, at least, small fire-arms in our acceptation of the term. Instruments called hand cannons are said to have been introduced into the English army in 1471, when Edward IV., landing at Ravenspur, in Yorkshire, brought with him among other forces, 300 Flemings, armed with these weapons.

The greatest revolution which has taken place in the construction of portable fire-arms, concerns the look or discharging apparatus. At first they were totally devoid of lock, and their discharge was effected by manual application of a match: then followed the match-lock; next the wheel or pyrites lock; then the ordinary flint lock; afterwards the various kind of percussion locks, which will more properly fall under our notice by and by. The match-lock scarcely merits description, and flint and percussion locks are, it is presumed, familiar to all. The wheel-lock, however, perhaps few have seen, and, therefore, a slight description of it may not be amiss. Whoever has observed the shower of sparks which fly off from a razor-grinder's apparatus will have a very fair idea of the construction of a wheel-lock. The wheel was made, however, of steel, and was caused to rub against a flint or lump of pyrites which was, moreover, wound up by a key, so that, on pulling a trigger, it spun round with great velocity, emitted a shower of sparks, and thus ignited the charge. The pyrites or wheel-lock was introduced into England about the reign of Henry VIII., and continued in use until the reign of Charles II., when the flint-lock became general. The percussion-lock, as most people know, is a very recent discovery indeed.

We have no further space to devote to the history of the bow or ancient guns, and will now take leave of our readers, by directing their attention, not only to the English bows in the Exhibition, but also to some very pretty specimens of Swiss make, in the department of that little republic. Our next article will be devoted to the examination of special peculiarities of modern guns.

NASMYTH'S STEAM HAMMER.

Perhaps there is not on record an invention which has introduced itself into such extensive use in so short a time as Nasmyth's extraordinary steam hammer. One of these powerful engines, of the size most in use, is placed in the southern division of the Machinery department of the Great Exhibition, not far from the Britannia hydraulic press; and, indeed, it is much to be regretted that this most useful engine is not shown at work, neither is there any account of it in the official and illustrated Catalogue. Since 1842, in which year Mr. James Nasmyth took out his patent, not fewer than 330 of these powerful and manageable machines have been constructed and distributed in all quarters of the globe. In many of the large engineering establishments around London, we find even three and four called into requisition; and we advise those of our London readers who have an opportunity of visiting any of the respective establishments of Messrs. Maudslay and Field, Lambeth (who have three hammers of the respective weights of 30, 15, and 5 cwt., for different kinds of work); Penn and Son, Greenwich; Blyth and Co. and Seaward and Co., Limehouse, Miller and Ravenhill, Blackwall; and last, though most important of all, the highly interesting and extensive iron ship-building establishment of Messrs. J. C. Mare and Co., at the Orchard House, Blackwall, to lose no time in seeing the extraordinary operations performed through the instrumentality of the steam hammer, requiring for itself the attendance of one person only. The accompanying Engraving represents an elevation of the hammer, which for this, the most useful size, weighs only 20 cwt.; but the most gigantic machine of the kind which has yet been turned out is that at Messrs. Mare's large works, having a hammer of 6 tons weight, with a stroke of 6 feet. On a recent visit to this establishment, we found one of those ponderous and apparently unwieldy paddle-wheel shafts for a pair of marine engines, building by the celebrated firm of Maudslay and Field; this shaft, which had been entirely forged by the giant hammer "Thor," occupied upwards of three weeks from its commencement to its completion: it is of the extraordinary weight of 16½ tons, and 27 feet 9 inches in length; yet, by aid of a powerful crane, the operation of welding and forging this large mass is rendered as simple and easy as that of a horse-shoe in the hands of a country smith. Messrs. Mare and Co. have also three other Nasmyth hammers, each decreasing in power to suit various kinds of work. Referring to the hammer contributed to the World's Fair, we find the anvil, which is chiefly buried below the floor, weighs eight tons; the hammer itself, already mentioned, and which is suspended from the piston rod, 1½ ton: the piston which works in the cylinder, placed at top of the machine, is of 16 inches diameter; and the extreme fall of the hammer, or what in steam-engines is usually called the stroke, is equal to 42 inches. The ingress steam pipe is of two inches diameter, the pressure of steam usually employed being equal to 40 lb. on the square inch, which, as we have in another communication stated, is about the same as that at which the steam enters the Machinery in Motion department of the Great Exhibition. The hammer being on the self-acting principle, every degree of blow, from that of merely cracking an egg-shell to that of a dead pressure of 500 tons, is attainable. The whole width of the frame at the level of the floor is 11 feet; and the space between the legs in which the top of the anvil is placed is 7 feet; the height of the machine being about 15 feet. The frame is bolted down to large iron plates let in flush with the floor; but if the hammer at the Exhibition had been intended to have been shown in operation, a much stronger foundation would have been required. By admitting the steam under the piston, the hammer is elevated to the desired height; and by its own gravity the hammer falls; but the fall may be instantly ceased, if desirable, by the admission of steam, according to the particular kind of blow required. In ordinary work, as many as 70 blows are given in a minute.



NASMYTH'S STEAM HAMMER.

In the former part of this notice we mentioned the large engineering establishments in and around the metropolis, at which the steam hammer may daily be seen fulfilling its appointed duties; but at all the principal anchor-makers, at all the large engine builders, and at the principal railway manufacturing establishments in the kingdom, the making up of iron, either from scraps, old rails, loops, or from the pile, is also effected by means of the Nasmyth hammer.

From a statement of iron made by the use of this machine at the North-Western Company's manufacturing establishment at Crewe, in six months ending June, 1851, we find that upwards of 176 tons of iron, in the shape of tires, axles, &c., including a staff for a stationary engine, was made; and that, after deducting the cost of wages, scrap iron, and coals, there is a clear profit of upwards of £2300. Nothing can be more convincing of the utility of this engine than the above fact. Before the introduction of this adjunct to the smithy, the forging of the large marine engine shafts was not only a tedious but an uncertain process; and many an accident which has occurred to the ocean steamers might have been traced to the imperfect forging of the iron; for, without blows of sufficient energy, it is impossible to expel the scoria from between the bundles of iron rods, which, as in the United States, they attempted to weld together to form their main shafts.

Before concluding, we may draw the attention of our friends to those beautiful anchors forming part of the Great Industrial Show, which are seen by comparatively few of the visitors to the Great Exhibition—on account of being placed in the yard at the west end of the Building—all of which were wrought by the aid of the steam hammer, and which are severally contributed by Brown, Lennox, and Co.; the Bedlington Company, near North Shields; and Fox, Henderson, and Co., the constructors of the Palace of Glass, for Captain Rogers, who has designed a new form of anchor.

It is quite impossible to say to what uses Nasmyth's last invention will hereafter be applied. At the present time, however, in addition to the formidable kind of work for which it has hitherto chiefly been employed, its application to the stamping out of dish-covers, and the moulding and forming of silver plate, is now in progress.

It is curious enough, in looking over the specification of James Watt, to discover that he had thought of using a hammer in connexion with the power of steam, but had never worked out the really useful mode of applying the hammer, viz. that of attaching it to the piston-rod itself. This important step was left for the genius of one of our own times practically to carry out. It is in Watt's patent of April 28, 1784, that we find the following:—

> By fifth new improvement consists in applying the power of steam or fire engines to the moving of heavy hammers, or stampers, for forging or stamping iron, copper, and other metals or matters, without the intervention of rotative motions or wheels, by fixing the hammer or stamper to be so worked either directly to the piston or piston-rod of the engine, or upon or to the working beam of the engine, or by fixing the hammer or stamper upon a secondary lever or helve, and connecting the said lever or helve, by means of a strap or of a strong rod, to or with the working beam of the engine, or to or with its piston or piston-rod.

BARTON AND EAMES' LACE GASSING MACHINE.

Mr. Samuel Hall, of Basford, near Nottingham, whose name is favourably known on account of his condensing apparatus and other inventions, originally took out a patent for a machine for gassing lace; and in order to show the importance of this invention, it is only necessary to state that the cost of burning off the fibres from muslin and other delicate fabrics, some thirty-five years ago was at the rate of 6d. per square yard, whereas at the present time as much as 800 square yards of lace may be gased for the same sum.

The gassing machine in the Machinery in Motion Department of the Great Exhibition, which is exhibited by Messrs. Barton and Eames, consists of a series of gas-burners, placed in a straight line, and regulated in length by the width of lace to be "gassed." The lace is made to pass through the various jets of gas at such a velocity as will just remove the fibres by which the whole surface is covered, and yet not destroy the fabric itself. It is quite evident, therefore, that the exact speed at which the lace is required to travel through the jets of gas must be regulated with great nicety; for if the velocity be too great, the object in view will not be attained.

During the process of gassing the lace is carefully watched by four persons, two of whom stand in front, and two behind the machine, in order to see that the lace is duly gassed, and also to prevent the fabric itself taking fire.

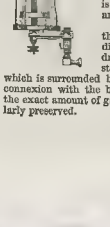
Cotton thread which has been subjected to a process somewhat similar to that above directed, by means of a machine somewhat modified from that in the Exhibition, is sold in the market as "gassed thread," and in consequence commands a higher price.

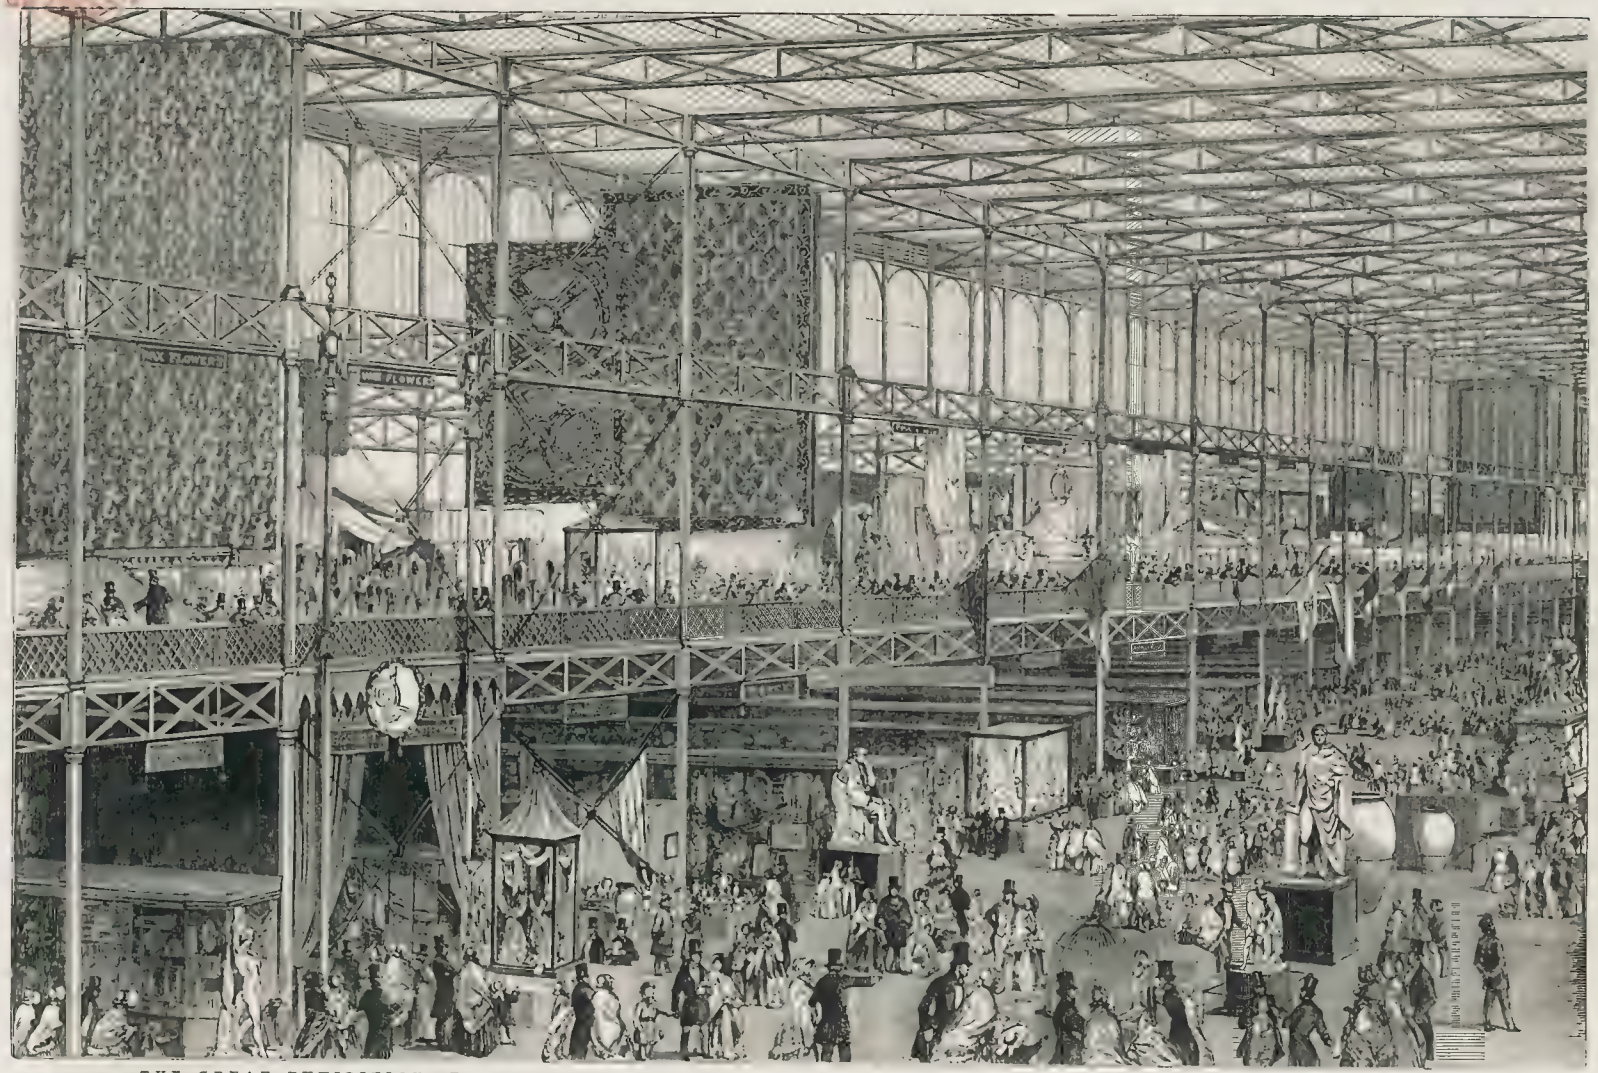
BIDDELL'S PATENT SELF-REGULATING GAS-BURNER.

The difficulty of maintaining a uniform flame in the ordinary gas-burner is well known, not only to the manufacturer of burners, but also to the consumer of gas. To remedy so glaring a defect in artificial lighting, has long been a desideratum; and it was left for Mr. Biddell, of Ipswich, to accomplish so great and valuable an improvement; and the mode in which he has accomplished this is by the most philosophical means.

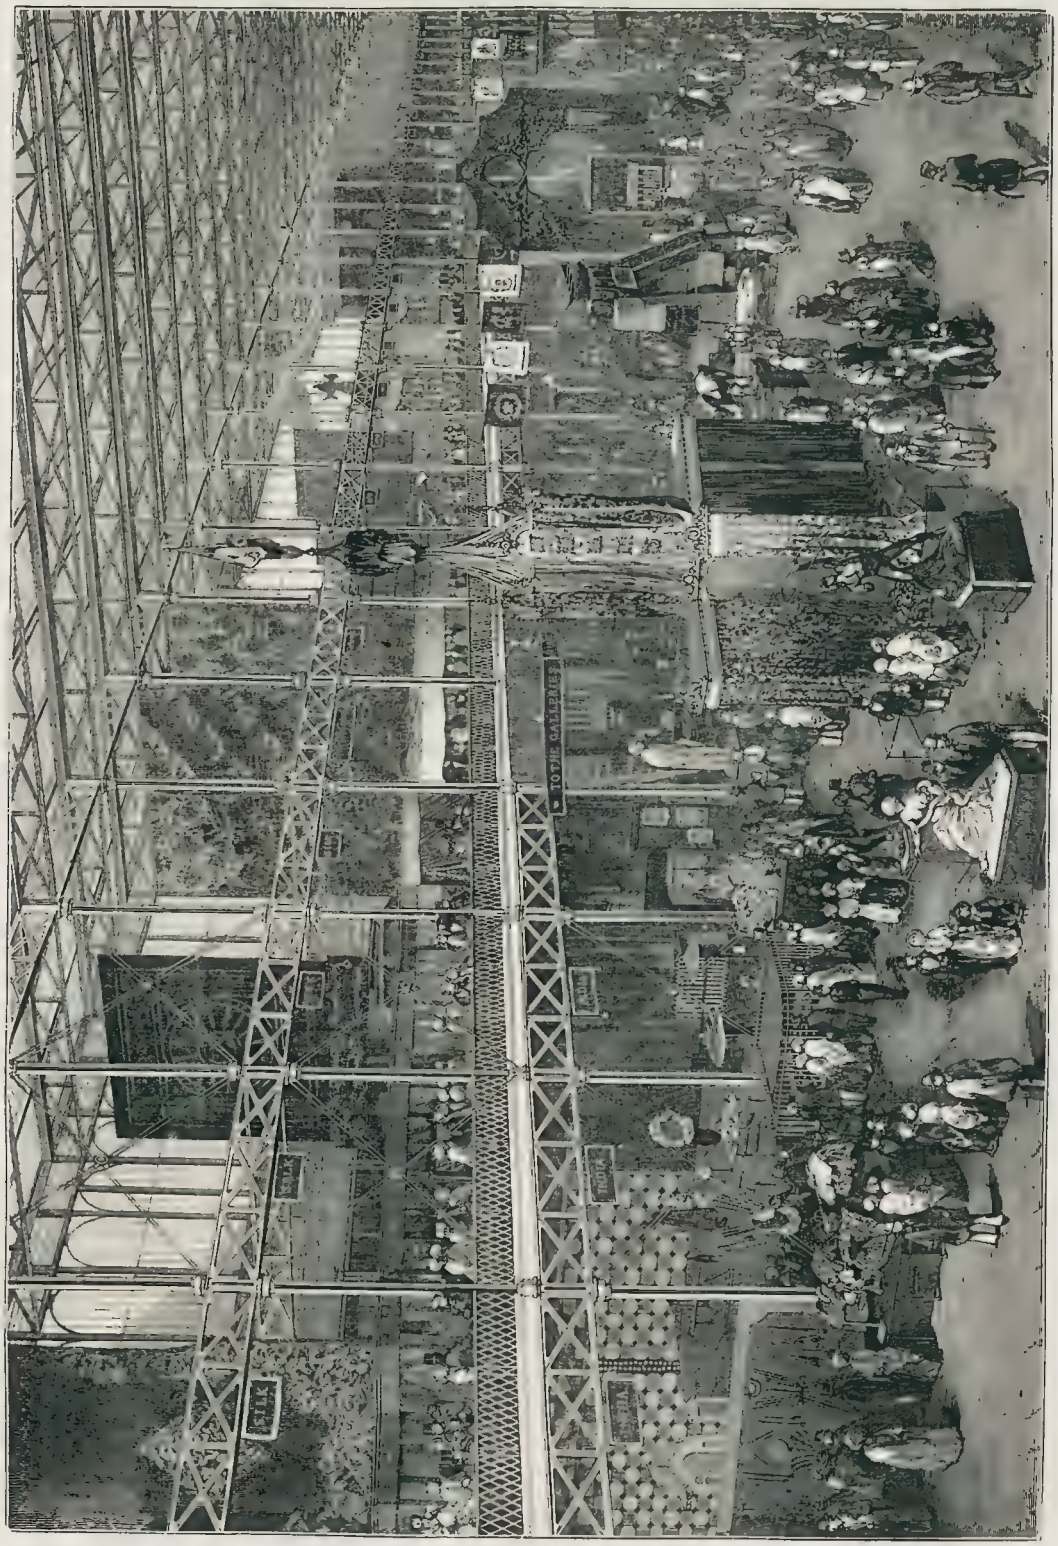
The inventor had in view, when he first proposed to remedy the defect already alluded to, the compensation pendulum of a clock, whose true length is preserved, notwithstanding the alternation of heat and cold to which it is continually subjected.

Thus Mr. Biddell introduces into the centre of the burner a vertical compound rod of about ¼ inch diameter, consisting of brass and steel, the cylindrical case being of brass, and the core within of steel. By the expansion and contraction of this rod, which is surrounded by the flame, a small lever and simple valve, in connexion with the bottom of the rod, is acted upon so delicately that the exact amount of gas required to preserve uniformity of flame is regularly preserved.





THE GREAT EXHIBITION.—THE EAST NAVE VIEWED FROM THE SOUTH-WESTERN GALLERY.—(FROM A DAGUERREOTYPE BY CLAUDET.)



THE GREAT EXHIBITION.—THE WEST NAVE VIEWED FROM THE NORTH-EASTERN GALLERY.—(FROM A DAGUERREOTYPE BY CLAUDET.)

MACHINERY IN MOTION.

(SECOND NOTICE.)

We this week resume our description of Mr. Gwynne's centrifugal pump, from p. 250. There is a circular opening in one side of the case rather larger than that in the piston, through which the suction-pipe passes. The inner end of this suction-pipe is furnished with a collar, by which it is secured to a corresponding projection in the side of the piston. It is requisite that this joint should be made quite tight, to prevent the admission of sand, grit, &c. The discharge-pipe (in the present instance placed vertically) is fixed on one side of the receiver. A hollow balancing-nut is fixed in an opening on the opposite side to that in which the suction-pipe is fixed, the object of which is to equalize the lateral pressure on the piston. The main journal of the shaft is attached to the hollow balancing-nut, passing through a proper stuffing-box and gland, to render the whole properly water-tight.

In cases of fire, a pump on Mr. Gwynne's plan, with a discharge-pipe of 9 inches diameter, will throw 4000 gallons per minute; and for raising water from mines with a piston of 48 inches diameter (the pump making 400 revolutions per minute), the water would be raised to a height of 120 feet

The proprietor invites practical men to apply any reasonable test to his direct-acting balanced centrifugal pump, so that they may be enabled to make a comparison with other machines intended for the same purpose.

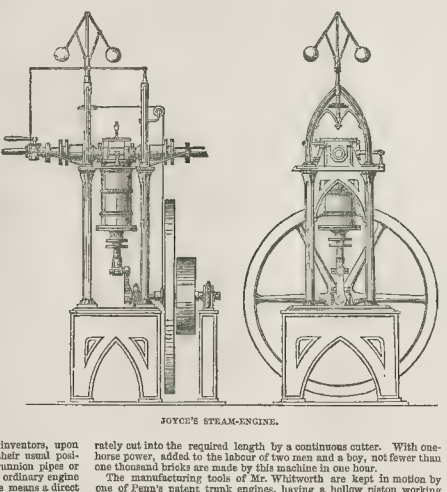
The general arrangement of Edwards' direct-acting engine (No. 12) is not very dissimilar to that of several other engines exhibited in motion. The fly-wheel and pulley are, as usual, on the crank shaft. From the pulley the motion, by means of a leathern band, is communicated to a second pulley, and so to the various American machines already mentioned.

We now come to the novel and ingenious engine of Messrs. Simpson and Shipton, which is worthy of especial attention. It is called by the inventors and proprietors, a "Patent Short-stroke Reciprocating Engine." The great object has been to unite, in as simple a form as possible, the advantages of the reciprocating and rotary engine, and thus obtain that kind of power which is equally applicable to engines required either for stationary, locomotive, or marine purposes. Thus, in the present instance, the piston and crank are combined, the piston being moved from top to bottom and from bottom to top of the steam-chamber alternately, as in the cylinder engines, while the crank still possesses all the properties of that in ordinary use. The principle of this engine is that of "an eccentric revolving in its own diameter." It has to overcome centres, as in the ordinary engine; the revolving motion, however, is obtained direct, instead of through the intervention of a crank. The steam-chamber is substituted for the ordinary cylinder. The eccentric, or piston, being keyed on to the shaft, a back plate is fitted into a recess in the steam-chamber, and is pressed against the piston, either by springs or by the admission of steam behind it. Thus, if any wear takes place in the periphery of the piston, the plate is intended to compensate for it. The piston is made steam-tight at both ends with rings of metal fitted with conical seatings cut open on one side so as to leave a lap-joint. The shaft is carried on vibrating rods, so as to vibrate the distance of the eccentricity of the piston. The power from the piston to the lower cranks is conveyed by means of connecting rods, which are always parallel, working in direct lines. Although the steam is admitted above and below the piston, as in ordinary engines, the valve is different, as it exhausts through the back, and is packed similarly to the ends of the piston, being worked by an eccentric lever. By the arrangement of this engine, the first motion may be attached direct to the main shaft; thus unnecessary gearing is dispensed with. The small space occupied by Messrs. Shipton and Simpson's engine, and the comparatively inexpensive foundation required for it, are among some of the numerous advantages which this singularly ingenious machine possesses. It is calculated at ten-horse power, and actuates all the cotton machinery of Messrs. Parr, Curtis, and Madely, of Manchester, including three self-acting mules, two roving frames, and three drawing frames. It also gives motion to two roving frames, and one power loom, of Messrs. Mason and Collier, of Rochdale.

The cotton machinery and long-line flax machinery of Messrs Higgins and Sons, of Salford, including a patent roving frame and double self-acting mule, and also their flax machinery, including a drawing-frame, a roving-frame, and a spinning-frame; are all driven by the new rotary engine of Messrs. F. and C. Davies, of Tipton. These engines, which they call "patent elliptic revolving engines," are calculated at six horse-power; and, although at first putting us in mind of the Birmingham disc engine, invented by a person of the same name, yet, upon examination, are found to be entirely different in action, as the disc in the present instance rotates only in one plane, whereas in the disc engine the disc rotates between two cones.

All the machinery which we have hitherto noticed occupying the western court of the Machinery in Motion department, is driven by the engines of Messrs. Hick, Mr. Edwards, Simpson and Shipton, and Messrs. Davie.

We now enter the large hall of the Machinery in Motion, which lies between the second-class Refreshment-Room and the north wall of the Building, and the first steam-engine we meet with is that of Mr. Joyce, of Greenwich, which he calls a "high-pressure pendulous engine." The cylinder is suspended by trunnions from the top, and the piston gives motion to a crank, on the shaft of which are the fly-wheel and pulley. By a band from the latter motion is distributed to various pulleys and shafts, by which a variety of different machines are set and kept in motion. The engine itself is of simple construction, and does its work well; but the frame, of cast iron, is far too light, and consequently very shaky when all the machinery in connexion with it is in motion. The principle discovered by Woolf, of introducing steam of a high pressure into a small cylinder, and afterwards allowing it to act expansively in a larger one, adding to its effective force by condensation, is in this engine applied in an extremely ingenious and simple manner. The cylinders are not placed before each other, as is generally done in the beam engine, but firmly bedded and jointed side by side, forming what might be termed a double cylinder, which cylinders the inventors, upon a principle entirely new in this country, invert from their usual position, and suspend them between the framing, the trunnion pipes or steam ways being placed at the end, or what in the ordinary engine would be termed the bottom of the cylinders. By these means a direct motion is applied to the crank, without the intervention of cross-heads, side-rods, or parallel motion; the piston-rod being attached to the crank pin, the cylinders vibrating with a pendulous movement on their bearings or trunnions, whilst the oscillation of the cylinders works the slides by means of a bar. These engines are capable of exerting a power of 50 per cent. more than the power at which they are rated. From the simplicity of the engine, there is no risk of derangement; and the friction of the working parts is diminished three-fourths, whilst the consumption of fuel is less than 5 lbs. per horse-power per hour, and there is a saving of one half the space usually occupied by the ordinary steam-engines. Messrs. W. Joyce and Co. first commenced manufacturing these engines in 1834; since which period they have been created in large numbers. The accompanying cuts represent a front and side elevation respectively of the engine.



JOYCE'S STEAM-ENGINE.

The first machine actuated by Joyce's engine is for working spindles intended to supersede bands or straps, invented by Leopold Muller. It consists chiefly of a horizontal shaft, having a series of vertical bevelled cog-wheels working into smaller horizontal wheels attached to the spindles.

Master's ice-making machine, which has now been in successful operation for many years, and by which are rapidly made ices for the second-class refreshment-room of the Great Exhibition, is the next we find at work in connexion with Joyce's engine.

The third in order is Milligan's patented power loom, made by Hodgson and Haley, by which any number of picks may be put into a given length of work—its taking-up motion constituting the chief point of excellence.

The fourth is R. Sutcliff's patent spinning frame of 12 spindles which make 5564 revelutions per minute. This machine is exhibited on account of its high velocity, and for the regularity in the tension or drag.

The fifth machine driven by Joyce's engine is the new power loom of O. Chalmers, for weaving table-cloths. We observed in the loom a damask table-cloth of a rich pattern, extending when completed to 3½ yards square.

The sixth is George P. Macinder's self-acting mule of 84 spindles, for spinning cotton-wool into yarn, with oscillating lever for taking in or putting up the carriage, as also a mode of putting down the faller from any of the twist pulleys by centrifugal disengaging catches.

The seventh is the patent worsted winding machine of 12 spindles, of T. Lucas Paterson; woollen, cotton, or linen yarn, from the hank are also wound upon the shuttle *cop* or *pirn*. It is exhibited on account of the saving of waste effected, and also as producing an "improved build of cop."

The eighth is a fine worsted damask loom, made by James Bairstow, and exhibited by Messrs. Taylor and Sons; the articles woven being all of English wove.

The ninth is Mark Smith's canvas loom, as also his fustian loom (Class 6, No. 22), three-shuttle gingham looms, and a small silk loom.

The tenth is Joseph Harrison's patent power-loom.

The eleventh, Hornby and Kenworthy's patent sizing or dressing machine; also two improved power-looms, exhibited by Kenworthy, and Kenworthy and Bullough, respectively—which have not only been described, but also illustrated in our pages.

Twelfth, and finally, an old power-loom, very curious on account of its being made and in general use more than half a century ago. It is exhibited for the purpose of illustrating the vast improvements which have been effected in the power-loom during the last 50 years.

McNaught's double-cylinder condensing engine, having 9-inch cylinders and 8-inch stroke, is shown in action in connexion with a machine for cutting out wooden bobbins, thirty of which are completed in each minute.

No. 24, Class 5.—Messrs. Lynch and Inglis, of Manchester, exhibit a one-horse portable engine of their own design, which works their wool-combing machinery: the cylinder is of 3½ inches diameter, with a stroke of 7 inches.

Among the numerous articles which have been admitted to the Building since the 1st of May, is a patent portable steam-pump, of W. E. Carrett, of Leeds, which is designed for lifting and forcing water in one continuous stream, at all pressures. It has a 4-inch cylinder and 7-inch stroke, and is worthy of an inspection on account of its novelty.

Messrs. W. Fairbairn and Sons supply power to the following machines by means of their vertical direct-acting steam-engine, having a 19-inch stroke, the cylinder being chiefly inclosed within the iron pedestal, as in the case of Mr. Hick's engine. Whether for its design, simplicity, or ease of action, it may be taken as one of the best samples of steam-engines sent to the Exhibition. The machines alluded to are the worsted machinery of Messrs. D. Berry and Sons, of Bowling, near Bradford, including altogether six frames; the woollen machinery of Mr. John Mason, of Rochdale, including a self-acting mule, and a patent condenser, or endless cording engine; as also a large power-loom.

Mr. Andrew Shanks exhibits in action his improved high-pressure engine, which actuates his screw-boiting machine, and also his detail planing machine.

No. 29, Class 5.—Messrs Hodge and Co. exhibit an oscillating direct-acting engine. The cylinder, hung in the middle, is of 6 inches diameter, with a 20-inch stroke. This engine drives the flax-dressing machinery of Mr. Plummer, of Newcastle (No. 74, Class 6); the patent power-loom (No. 56, Class 6) for weaving sail and other cloths, the novelty of which consists in the introduction of a stick to beat up the weft; and the brick-making machinery of Messrs. Randell and Saunders, of Bath, which has generally been seen in action day by day since the opening of the Exhibition, until within a few days, when it ceased to work, on account, we were informed, of the expenses attendant thereon. Surely a portion of the large funds at the disposal of the Commissioners might be appropriated towards keeping in action the machinery of those exhibitors who do not find it convenient to continue the daily expense. Messrs. Randall and Co.'s machine is constructed for the purpose of making rapidly bricks for various purposes, according to their patent form, as well as every description of tiles and piping. The clay being properly pugged, by means of two screws working together, is made to pass through a die at one end of a cylinder, through which it is forced by considerable pressure. The bricks thus formed are found to be of uniform texture and size, as the continuous band of clay is accurately cut into the required length by a continuous cutter. With one-horse power, added to the labour of two men and a boy, not fewer than one thousand bricks are made by this machine in one hour.

The manufacturing tools of Mr. Whitworth are kept in motion by one of Penn's patent trunk engines, having a hollow piston working vertically (cylinder 8 inches diameter, stroke 9 inches), communicating motion in the usual way by means of a crank to a fly-wheel and pulley of equal diameter, one on either side of the circular iron frame on which the machine is fixed. This engine is calculated at five horses power. The machines of Mr. Whitworth are—the patent duplex wheel turning lathe, the self-acting nut-shaping machine, with double cutters, to square two objects at the same time; a self-acting vertical drilling machine; a self-acting planing machine; a patent crank planing machine; a radial drilling machine; a patent slotting machine, of 6-inch stroke, to admit articles of two feet diameter; and a similar machine, with a 12-inch stroke, to admit articles of 3 feet diameter.

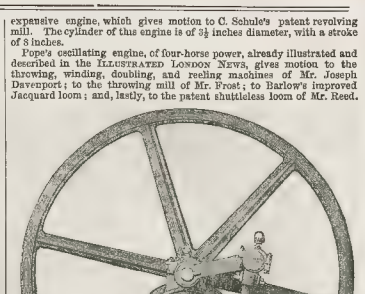
The well-known Butterley Iron Company exhibit an oscillating engine (No. 25, Class 5), the cylinder being suspended in the middle by hollow trunnions, through which the steam is admitted on one side and carried off on the other; the cylinder is 9 inches in diameter, and the stroke 18 inches in length. The attendant reports its power at 8 horses. The flax machinery of Messrs. Lawson is driven by the Butterley engine, including a silver roving frame, a carding engine, two heckling machines, one fine spinning frame; a twisting frame, a fine spreading frame, and a first and second drawing frame.

The same engine also actuates Parker's patent mathematical power-loom for weaving sail-cloth (No. 77, class 6), and also his perning machine, of ten spindles.

No. 37, Class 5.—Evans's high pressure oscillating engine—the cylinder of which is hung at bottom, on transverse hollow trunnions—is calculated at six-horse power. It drives Crawhall's vertical rope-making machine, by which the whole process of rope-making is entirely completed; and it is believed to be the only machine of the kind in the kingdom. Huddart's exquisite rope-making machinery fully described in the proceedings of the Institution of Civil Engineers—having lately been taken to pieces, and sold to different purchasers.

No. 45, Class 8.—Mr. E. Lloyd exhibits his patent double cylinder expansive engine, which gives motion to C. Schule's patent revolving mill. The cylinder of this engine is of 5½ inches diameter, with a stroke of 8 inches.

Pope's oscillating engine, of four-horse power, already illustrated and described in the ILLUSTRATED LONDON NEWS, gives motion to the throwing, winding, doubling, and reeling machines of Mr. Joseph Davenport; to the throwing mill of Mr. Frost; to Barlow's improved Jacquard loom; and, lastly, to the patent shuttleless loom of Mr. Reed.



STEAM-ENGINE —BY EVANS.

Maudelay's double cylinder direct-acting engine drives their improved coining press, the cylinders of which are of 5 inches diameter, with a stroke of 16 inches, the power being calculated at six horses. It also gives motion to the following beautifully executed models:—1st. A pair of direct-acting double cylinder marine steam-engines, patented by Joseph Maudslay and Joshua Field, fitted with paddle-wheels and improved feathering floats. On this plan Messrs Maudslay and Co. had constructed machinery for marine purposes since the patent was granted to them of an aggregate power of 19,130 horses, and some of them of 800-horse, collective power. 2nd. A pair of direct-acting marine steam-engines, with oscillating cylinders, patented by Joseph Maudsley, on which plan and construction this well-known firm have furnished engines of the aggregate power of 2100 horses. 3rd. A pair of direct-acting double piston-rod marine steam-engines, peculiarly adapted for the shallow rivers of India and other parts of the world; patented by Joseph Maudslay and Joshua Field for the Indus and Sutlej, and for the Rhone, of the aggregate power of 545 horses. 4th. A pair of marine side lever beam-engines, on which plan Messrs. Maudslay and Co. have constructed 103 pairs, of the aggregate power of 11,308 horses. 5th. A pair of direct-acting annular cylinder marine steam-engines, patented by Joseph Maudslay, fitted with paddle-wheels and improved feathering floats. Engines on this principle have been fitted to several of the fleetest packets in the Channel, and they have altogether completed twenty-three pairs of similar construction, of the aggregate power of 2280 horses. 6th, and lastly. A pair of direct-acting marine steam-engines for driving a screw propeller, so constructed as to occupy but little space; and when fixed in the vessel to be entirely below the water-line. Thus we find that this celebrated firm have constructed marine engines on their various plans amounting in the aggregate to a power of 35,183 horses.

The great engine manufacturing firm of Messrs. Bryan Donkin and Co., having satisfied themselves of the applicability of the celebrated disc engine, exhibit one calculated at six-horse power on their improved construction, which gives motion to their disc water-mill, and also to their disc pump: the engine is of large size, having a disc of 17 inches diameter, and the continued leakage of steam, which was one of the great objections to this class of engines when first brought out, appears to have been entirely remedied. It also actuates the circular planing machine, drilling machine, and slide lathe of Messrs. Smith and Co., of Leeds; and likewise the centrifugal sugar-drying machine of Messrs. Rotch and Co. As this disc engine gave rise to a strong controversy among engineers when it was first brought out, and, indeed, for some years after, it may be as well to advert briefly to the history of its appearance in the mechanical world. About twelve years ago, we were called in to examine and report on two engines of this construction erected at the Bromsgrove Alkali Works, another at Wednesbury, and a third at Birmingham. The result of our examination and experiments was, that in point of economy of first cost, and foundation, and also of space, it was unexceptionable; but that in point of consumption of fuel there was no thing gained by its use: the paucity and simplicity of its parts were great recommendations, but still leakage was found to be a great obstacle; and Mr. Davies, a very ingenious mechanic and original inventor, made several improvements in engines of this construction subsequently put up. Davies was appointed mechanical manager of a company formed to build these engines on an extensive scale, of which company Mr. Rufford, the celebrated banker, who has lately figured away in the papers, was the chairman, and it is believed that until very lately he still retained a large share in the property of the Birmingham Disc Engine Company. At the first meeting of the British Association at Birmingham, a paper was read on the subject of this disc engine, the use of which was strongly opposed by some engineers. The late Mr. Stephenson, Mr. Robert Stephenson, Mr. Charles Fox, and Mr. Josiah Parkes, all visited the British Alkali Works, for the purpose of examining this novelty in the engineering world. Mr. Bishop, who was formerly connected with the Birmingham and Gloucester Railway Company, paid great attention to the improvement of the disc engine; and some time since erected one of his improved disc engines at the *Times* office, in Printing-house-square, which still actuates the vertical printing-press of Mr. Applegath, by which eight copies of one side of the paper are thrown off at each revolution of the vertical cylinder.

From the time of Watt until the present day a good rotary engine has been considered a desideratum; and, perhaps, upon the whole, the improved engines exhibited by Messrs. Donkin and Co., and Mr. Bishop, come nearest to the requirements of engines in obtaining direct circular motion.

Messrs. Clayton, Shuttleworth and Co., of Lincoln, exhibit their six-horse oscillating engine, which gives motion to Appold's centrifugal pump, which is close to Messrs. Donkin's machinery: and, immediately adjoining Appold's machinery, is Bessemer's horizontal patent centrifugal disc pump. Mr. Bessemer is well known in connexion with many important practical inventions of the present day. The general principle of Mr. Bessemer's pump is the same as that of Mr. Appold's; the former of which, however, is fixed horizontally, while the latter works vertically. Mr. Bessemer's centrifugal pump consists of an iron case composed of two parts, which are connected together by a flange, the whole resting on a foundation of brickwork and masonry. One compartment contains the disc, while in the other is fixed the wheel-work by which the disc is put in motion. A suction-pipe attached to one side of the case communicates with the water to be raised. The disc, composed of two circular metallic plates, connected together by several intermediate radial leaves or fans, is fixed on a shaft, working in proper brass bushes. By means of elastic washers under the heads of the screw-caps, the escape of water is prevented. Motion is given to the vertical shaft by means of a horizontal oscillating engine of 10-inch cylinder, and 21-inch stroke, calculated at six horses' power. The quantity of water

raised in a minute to a height of four feet is very large, as it is represented by a weight equal to twenty tons.

No. 310, Class 6.—R Bradley and Co. exhibit an interesting model of a colliery in action, which is worked by a pair of small cylinders placed horizontally.

No. 418, Class 6.—Messrs. Robinson and Co. exhibit the largest and most powerful of the steam-engines in motion, being an oscillating engine, with the cylinder hung by trunnions in the middle, having a diameter of 18 inches, and stroke of 42 inches in length, calculated at 24 horses, which drives their large sugar-cane crushing machinery by means of motion communicated thereto by a series of cog-wheels. The cane is first placed in a proper inclined receptacle, and passes under and between large rollers of iron, by which the juice is expressed, falling into a proper reservoir, from which it is conveyed in suitable conducting pipes, to be collected for use; the residue of the cane is carried away by a series of laths connected with endless chains, also worked by the machinery attached to the engine.

Mr. Croskill, the famous agricultural implement maker, of Beverley, exhibits his oscillating engine, the cylinder of which is also hung in the middle: it is of 7 inches diameter, with a stroke of 11½ inches. This engine not only gives motion to various mills contributed by Mr. Croskill, but also actuates the tenoning, planing, and mortising machines of Mr Furness, which were partly brought into requisition in the construction of the Crystal Palace, and which have already been described and represented pictorially in the pages of this Journal. It also gives motion to Mr. Dakin's coffee-roasting apparatus.

It is generally allowed that the French know full well how to prepare coffee so as to make it quite palatable; but in our country we are only just learning the art of roasting coffee in a scientific manner. The desiccating process of Messrs. Davison and Symington is perhaps the most perfect mode of accomplishing this desirable object; but it is only now and then that we are fortunate enough to meet with coffee prepared according to their system, which consists in placing the berries in revolving cylinders, and subjecting the contents to an exposure for a given time to hot currents of air until all the berries are uniformly roasted: the currents of highly-heated air are driven by a fan at considerable velocity. The flavour of moderately good coffee, prepared by Davison and Symington's plan, is exceedingly uniform and delicate. Mr. Dakin's method has also made some stir in the world on account of the cylinders in which his roasting is carried on being either of silver or an alloy of that metal; and his apparatus is shown in motion among the Machinery in Motion, though, of course, the roasting is not permitted to be carried on there. Instead of exposing the cylinders in which the coffee is placed to the direct action of the fire, an outer cylinder is provided, the whole being placed within an oven. The cylinder, as already mentioned, is made of an alloy of silver, in order to prevent the injurious effects produced on the flavour of the berry by the use of iron. In the cylinder are proper grooves, to suit a long slide, by the removal of which the coffee is placed in the cylinder. When in action, on account of the close fitting of the slide, the cylinder is rendered nearly air-tight. The end-plates of the cylinder are provided with bosses, placed centrally, to which the shaft is secured. The shaft is made hollow, for the purpose of receiving a long taster, by which a portion of coffee may be removed from the cylinder while the whole is in motion, the shaft having a slit in it for the above purpose. The cylinder can be moved in and out of the oven at pleasure. Mr. Dakin attaches great importance to the particular temperature at which the hot air is admitted to the cylinder.

Middleton's vertical cylinder direct-acting engine, with cross-head and double crank, gives motion to Applegath's vertical printing-machine, by which the Exhibition Supplements of the ILLUSTRATED LONDON NEWS are printed weekly. Applegath's machine is of first-rate workmanship, and was constructed by Mr. Middleton, who supplies the power to work it. The same engine gives motion, when required, to a new folding-machine, which, by permission of the proprietor and exhibitor, Mr Ingram, stands within the wooden dwarf inclosure of the vertical printing-press.

M'Clure and Co.'s lithographic press, on the other side of the passage, on the eastern side of the inclosure, as above, is also actuated by Mr. Middleton's engine.

Contiguous to M'Clure's lithographic press, we find Messrs. Hopkinson and Cope's 2½-horse engine (5-inch cylinder, 14-inch stroke), with cross-head on the old plan, working the Scandinavian horizontal printing-press exhibited by Mr. Hopkinson, and also the perfecting machine of Mr. Napier.

Near to the above are the centrifugal hydro-extracting or drying machines of Messrs. Manlove and Co., which are driven by a two-horse vertical cylinder engine in connexion with bevelled cog-wheels, working into smaller wheels placed horizontally, and which give motion to two vertical spindles, on the bottom of each of which is a rigger, from which motion is communicated to the pair of revolving copper vessels, in which clothes, sugar, and other articles are rapidly dried by the centrifugal action of the machine. The process of drying sugar by this machine is merely to place the raw material in segmental cases of gauze wire into copper vessels, and subject the whole to centrifugal action, when the treacle is rapidly extracted, and most beautiful crystalised sugar is left behind, samples of which may be seen, and perhaps tasted, by those curious in such matters. At Bristol there are as many as forty machines of similar pattern in one establishment.

No. 4c, Class 5.—Messrs. Bennett and Co. well known for their metallic outside shutters, exhibit their patent concentric reciprocating engine, with double action, suited either for high or low pressure steam, which is worked expansively. This engine is without the ordinary gearing or tappets, having a fly-wheel on one side and large pulley on the other, according to the plan so generally adopted by the exhibitors of machines at the Great Exhibition; the piston (6½ inches by 3 inches) works in a semicircular passage, having a 12-inch stroke. This machine is calculated as of four-horse power.

Messrs. Barrett, Exall, and Andrews exhibit, in connexion with their biscuit-making machinery (described in the ILLUSTRATED LONDON NEWS of August 2), a small Brunel engine of 1½-horse power. This engine also gives motion to a model of their patent safety horse-works.

No. 41, Class 5.—Nasmyth and Co. exhibit their improved engine, working the piston vertically, and having fly and pulley as in common use, by which motion is communicated to the large printing-press of Messrs. Napier and Sons. The cylinder of Nasmyth's engine is of 7 inches diameter with a stroke of 9 inches.

Near to the above, Messrs. Rennie exhibit, in connexion with Bishop's improved disc engine—to which we have already alluded while describing Messrs. Donkin's contribution—a screw propeller, showing how very suitable this kind of engine is as an auxiliary power in sailing-vessels.

The envelope-folding machine of Messrs. Waterlow, which we have already described, is also actuated by Bishop's disc engine.

No. 42, Class 5.—Messrs. Collinge and Co. exhibit, on account of its simplicity, their portable direct-acting high-pressure engine, of 5-horse power, already described in the ILLUSTRATED LONDON NEWS, and standing near to their sugar-cane crushing machine and improved screw jacks.

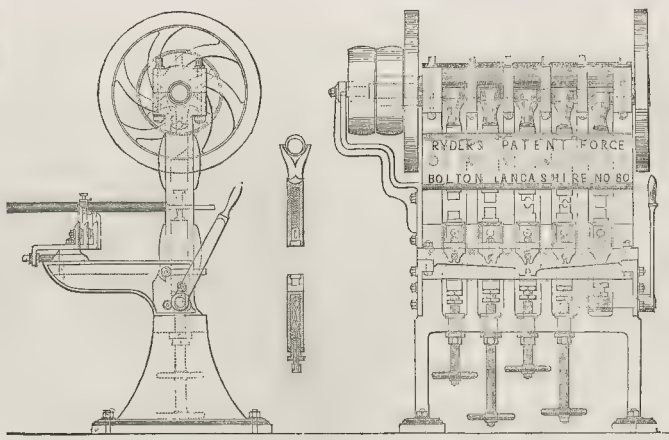
In connexion with his hydraulic crane, Mr. W. G. Armstrong exhibits a small engine with horizontal cylinder of about 1⅞ inches diameter, and 3-inch stroke, which is estimated at one-third of a horse power.

No. 11, Class 5.—Messrs. Hawthorn, celebrated as the makers of locomotive engines, have also, of late years, turned their attention to the manufacture of fixed engines, and we find an oscillating high-pressure engine of their construction—without slide valves, eccentrics, or gearing—giving motion to the pulverising sugar machinery of M. Herman, of Paris; which, with the machines of M. Flaud, placed in close proximity thereto, are the only machines from France exhibited in motion. Messrs. Hawthorn's engine has a cylinder of 2½ inches diameter, and a stroke of 3 inches in length.

507. M. Flaud, of Paris, exhibits a small direct-acting engine of five-horse power, to work his machinery for planing wood. It will be easily found, as being the first engine in action, starting from the east end of the large court occupied by the Machinery in Motion, which certainly appears to attract as large a number of visitors on each exhibition-day as any department of the great international display.

RYDER'S PATENT FORGING MACHINE.

THE forging machine of Mr. Ryder, of Bolton, is placed a little to the west of Appold's pump, and when in action attracts its share of wondering visitors. In consequence of fire not being permitted within the "wooden walls" of the Palace of Industry, this machine is not shown to full advantage; nevertheless, by the use of lead, instead of iron and steel, the materials usually brought into subjection by its mighty power, the use of the machine is demonstrated. In a case contiguous to the machine, various kinds of rollers are exhibited by Mr. Ryder for different purposes, such as mule and throttle spindles for cotton machinery, screw

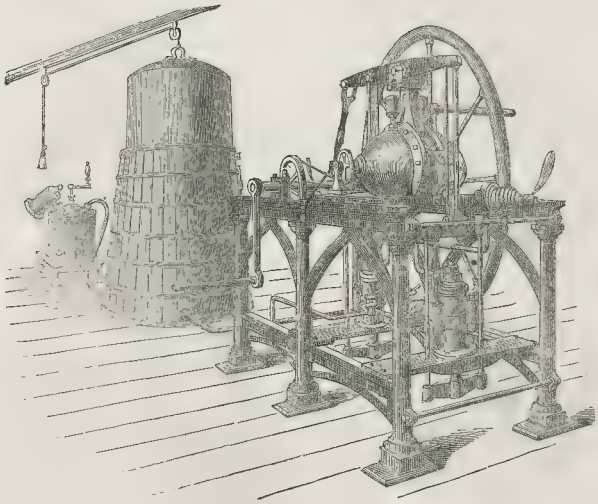


RYDER'S PATENT FORGING MACHINE.

bolts, and also round, half-round, square, flat, and "three-square" files respectively, all of which have been formed by similar machines. That shown in the Exhibition is worked by an oscillating engine having a 7-inch cylinder and 9-inch stroke: a horizontal shaft, which is caused to rotate by means of the crank, carries on it a metal pulley of 16 inches diameter, from which a band passes, when in ordinary use, to drive a fan of 17 inches diameter, but which, for the reason already stated, is not required to be used in the present instance. The fly-wheel is on the same shaft, a band from which passes to a 12-inch driving-pulley, running on a second shaft, by which five eccentrics are worked, and by which as many hammers are caused to fall at proper intervals, each of which is again lifted up by a spring; this operation is repeated 700 times in a minute. Under each hammer is an anvil, furnished with flat and other dies, on which the steel or iron to be operated on is placed—being kept in its proper position by a rest in front of each. The dies may be raised or lowered at pleasure, by means of vertical screws turned by circular open handles. The whole is mounted in a strong frame, and by means of bolts passing through the iron base plate is firmly secured to the joists of the floor.

SODA-WATER MACHINE. TYLER AND CO.

There are several soda-water machines exhibited in the Crystal Palace, many of them kept in active operation, and popping away right and left as they supply the demands of thirsty votaries. The principle



SODA-WATER MACHINE.—BY TYLER.

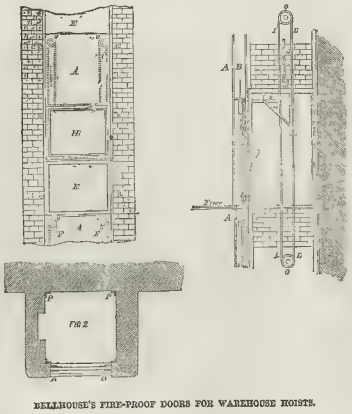
of all is generally the same—that of forcing a certain amount of carbonic acid gas, in combination with water, into strong glass bottles, which are then corked and securely wired. Sometimes the water is additionally medicated by the introduction of a certain quantity of alkaline matter previous to the impregnation with carbonic acid gas; but this is not always the case. The machine which we have engraved is that of Tyler, Hayward, and Co., which is adapted for two bottlers, and, acting on the continuous principle, is capable of making 300 dozen bottles a day. The condenser, seen in the centre of the upper frame, is of gun-metal, tinned or silvered inside; and, being separated by a partition in the middle, acts as two condensers.

BELLHOUSE'S FIRE-PROOF DOORS FOR WAREHOUSE HOISTS.

The recent fires in Manchester—especially those of George-street and York-street, and more particularly that of Westhead's warehouse, in Piccadilly—have caused every feasible scheme for the prevention of this disastrous cause of destruction in so vast a town, whose buildings are chiefly filled with stores of valuable produce, to be regarded with attention. In the manufacturing districts, generally, where the warehouses and factories are a considerable height, consisting of many stories, the ordinary staircase is generally superseded by the "hoist" or "lift," which is precisely the same thing as the well-hole of an ordinary staircase previous to the stairs being fixed therein, but with the addition of the hoisting or lifting apparatus. Mr. Bellhouse, who is an extensive builder in Manchester, has particularly turned his attention to a mode of preventing such well-holes from becoming, in cases of fire, large ventilating shafts, which naturally cause the fires to rage with greater fury. The means which he has adopted for this purpose, and a model of which will be found in the machinery department of the Exhibition (Class 5, No. 416 in the *official* catalogue), consists of iron doors sliding vertically in grooved frames of the same material, so that the communication between the different floors of the building and the well-hole may be entirely shut off in cases of fire.

The illustrations consist of an elevation (Fig. 1), plan (Fig. 2), and a section (Fig. 3).

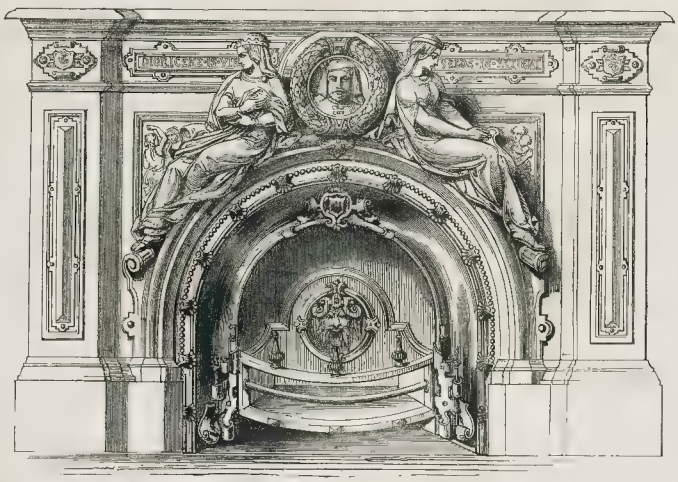
Hollow iron bricks (c c) are built into the brick walls of the well-hole as the building progresses; B B are side jambs of cast iron, having slides for the doors, the jambs being bolted to the hollow bricks; A A, stationary plates of cast iron bolted to the side jambs, which plates form the lintel in the case of one doorway and the sill of the next; E and E represent two sliding doors, the former opening upwards, and the latter downwards. The doors are moved either upwards or downwards by means of chains (F F), which are attached to the upper angles of the door



BELLHOUSE'S FIRE-PROOF DOORS FOR WAREHOUSE HOISTS.

(E E); the chains pass downwards, in grooves formed in the sides of the upper door (H), and over pulleys (F F), and are fastened to the upper side of the door H. Hence, in whatever direction the door H is moved, the other door (E) must necessarily have the reverse movement. The weight of the doors is so adjusted, that the excess of weight in the door H causes them both to close when left to themselves.

The slides or grooves in which the doors move are so arranged as to prevent them coming into contact with each other. In order to keep the doors open while the cradle is being loaded or unloaded, an apparatus of simple construction is attached to its interior. S is a bolt sliding to the left and right; T is a link connecting the bolt S with a point which slides perpendicularly in a groove as shown. If this point be moved upwards from the position shown, the bolt will be moved towards the left; and if the cradle is stopped at any particular place, and the doors open, the bolt will keep them in that position; but as soon as the cradle has to be removed, the bolt being withdrawn for this purpose, the balanced doors H and E are allowed to close. Let us take a case: the cradle has been left opposite to a door at the top of the well-hole, and a person at the bottom wishes to liberate the hoist, having first given notice by "Whishaw's telekouphonon," or speaking telegraph, of his intention; he withdraws the bolt S S, by means of the rope passing over the pulleys O O, at the top and bottom of the well-hole, and at the same time ensures the closing of the doors as already mentioned. By these self-closing arrangements, none of the apertures communicating between the apartments and well-hole need be left open, and the sliding doors are themselves fire-proof.



FIRE-PLACE, BY MR. JOHN THOMAS. STOVE, BY MESSRS. FEETHAM.

COLLINGE'S SCREW-JACKS.

Near to the sugar-cane crushing machine, as above described, are two screw lifting jacks by the same firm; the one consisting of a powerful screw turned in its nut by means of a lever, and capable of raising a load equal to from ten to twelve tons, while in the other a greater facility of motion is obtained by means of the introduction of a worm and wheel, instead of the ordinary lever, which in some cases cannot readily be applied In raising sunken buildings generally, these jacks are especially useful.

FIREPLACE. BY J. THOMAS

This is altogether a very classica production, in marble, the carving of the figures being exceedingly creditable as works of art. The grate is handsome and serviceable.

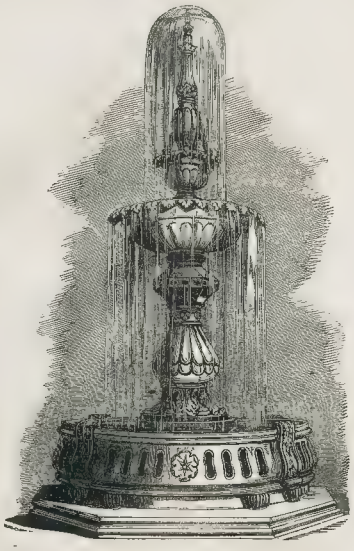
TWO PANELS IN CANNABIC. ALBANO

We introduced Mr. Albano's cannabic decorations to our readers in our Supplement of the 23d August. The two specimens which we now engrave—a panel of dead game, and a panel of fish, &c.—spirited productions in themselves, will illustrate the variety of designs to which this new material has been applied.

EARTHENWARE FOUNTAIN BY RIDGWAY AND CO.

Ridgway and Co., of Newcastle-under-Lyme, besides their general assortment of tea and coffee services in English porcelain, exhibit various earthenware fountains for gardens and conservatories, very pleasing productions, of which we present a specimen.

PANEL, FISH, &C., IN CANNABIC.—BY ALBANO.



EARTHENWARE FOUNTAIN. BY MESSRS. RIDGWAY AND CO.

PANEL, DEAD GAME, IN CANNABIC.—BY ALBANO.

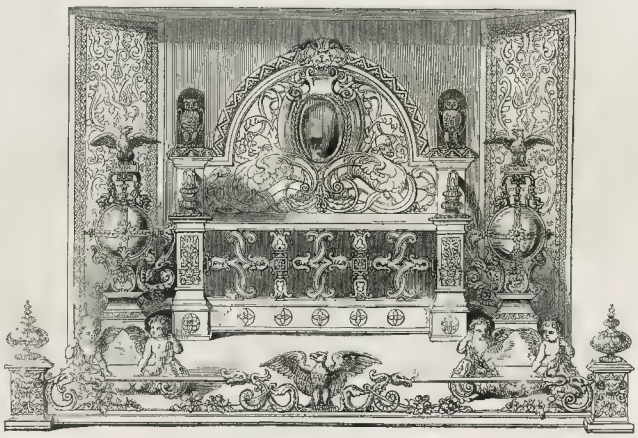
STOVE. BY FEETHAM.

Feetham, of Clifford-street, has several choice and curious works in the Elizabethan and mediæval styles; and not the least so is this very handsome stove, which is all of admirable workmanship, highly polished, and enriched with or molu. It is altogether a very carefully studied and creditable production.

STOVE. BY JOBSON AND CO., OF SHEFFIELD.

A very elegant production, after the new semi-spherical fashion which has peculiar properties of throwing out heat.

STOVE.—BY JOBSON AND CO., SHEFFIELD.



STOVE.—BY FEETHAM, CLIFFORD-STREET.

CHURCH MEDALS. BY J. WIENER.

M. Wiener, of Brussels, exhibits a collection of very beautiful medals, representing the principal cathedrals and other public buildings in Belgium. In the case of religious edifices, the exterior is given on the obverse, and the interior on the reverse of the medal; in the case of

CHURCH MEDAL.—BY J. WIENER.

other edifices, the reverse is occupied with a ground-plan of the building. We have engraved several of these little memorials.

The church of Notre Dame, at Tongres, is a very ancient foundation, which was devastated by the Huns, and rebuilt in the time of Charlemagne. The church of St Martin's, at Ypres, was founded early in the eleventh century. Both are very fine and interesting relics of antiquity. The Bishop's Palace, at Liege, is a most remarkable building of the middle ages, having been built by Cardinal Bishop Erard de la Marck, in 1533. It is now the Palais de Justice. The view given is of the interior court, the stunted columns of which have some resemblance to those of the Ducal Palace at

CHURCH MEDAL. BY J. WIENER.

Venice. They are the more curious, from the fact that each pillar is carved with a pattern different from all the rest.

CLARET-JUG, &c. BY REID, OF NEWCASTLE.

The claret-jug and bread-basket exhibited by Reid, of Newcastle, are in every respect highly creditable specimens of silver work, being elegantly formed, and richly chased and engraved.

ASTRONOMICAL TELESCOPE. BY A. ROSS.

This very fine telescope occupies a conspicuous position in the centre avenue of the Western Nave. The tube is 20 feet in length, and

CHURCH MEDAL. BY WIENER.

CLARET JUG, &C.—BY REID, OF NEWCASTLE.

TELESCOPE.—BY ALEXANDER ROSS.

the object glass 11½ inches in diameter. It is mounted on a stand, with equatorial movements and complete adjustment.

TABLE. BY LEISTLER.

This very handsome table, we think, com-

CHURCH MEDAL.—BY J. WIENER,

pletes our Illustrations of Leistler's furniture in the Austrian department. It is of a character with the other works, massive, yet elegant, bold and fanciful in device, and masterly in the workmanship.

BEDSTEAD. BY DOWBIGGIN.

The carved walnut-wood bedstead, with cornice, displayed by Messrs. Dowbiggin, must be classed amongst the most elegant and successful productions of its kind in the Exhibition The carving is rich and elaborate in design

CHURCH MEDAL.—BY J. WIENER.

without being obtrusive in the treatment, and the execution highly finished.

ORNAMENTAL SLATE TABLE-TOP. BY MAGNUS.

The various manufactures in slate, of which specimens are exhibited by Magnus, of Pimlico, are very beautiful in themselves, and are important as offering a new description of decoration for domestic purposes, which may be adopted with advantage. The enamelled slates represent various marbles inlaid after Florentine mosaic and other patterns; and the durability of the material, combined with the high polish it is capable of receiving, is a consideration very much in its favour. We engrave one specimen, an ornamental table-top.

ORNAMENTAL SLATE TABLE-TOP.—BY MAGNUS

SADDLERY AND HARNESS.

(CLASS 16. NORTH SIDE, WEST NAVE, NEXT TO FURS.)

We have already alluded in general terms to this subject; but the display of saddlery, although far from completely representing this important branch of British manufacture, demands something of a detailed notice, in justice to several exhibitors who have sent articles, not only excellent for workmanship, but novel in design. We will begin with

Saddles.—English saddles may be divided into at least six classes; that is to say, those used for riding on the road or hunting, for racing, for the infirm or lame, for military purposes, for ladies, for children, beside the cheap articles made for exportation. The ordinary English saddle differs from that of all other countries, in the circumstance that it is constructed for the every-day use of horsemen, who can ride without other help than the balance of the stirrup and the grasp of the legs and thigh, who do not need either high pummel in front or high spreading cantle behind. In this country it is presumed that all ordinary shaped saddles may be used for hunting, and in hunting it is indispensable that the horseman should be able to slip away from his falling horse with the greatest possible ease. It is the universal passion of Englishmen for the chase which has driven the old-fashioned and rather comfortable demi-pique saddle out of fashion, ever since fast riding to hounds came into vogue. We are also the only nation that rises regularly in the trot, and that motion requires a flat saddle. As the best customers of our saddles are hunting men, they have rendered universal a form which is the best for sportsmen, but very trying for foreigners. The demi-pique saddle, still in use in France, Spain, and South America, when well made, affords a very comfortable seat on long journies on an ambling or cantering nag; but a roll over in topping a gate or wall in a French saddle would be certain death by impalement.

The only concessions permitted to timid, invalid, or lame riders, are in the way of saddles padded so as to support the thigh and press against the knee. These are commonly called "Somersets." Several specimens of equal excellence are exhibited, on some of which a one-legged horseman might find great assistance. Mr. Phillips, a celebrated master of hounds in Wales, has only one; and there are all worth examination, because it is a mistake to imagine that all persons who ride know how to sit. There are a very considerable number of persons who begin to ride late in life, either because they are then, for the first time, able to afford it as an amusement, or because they take it up as pleasure, but as physic, by their physician's orders. Such persons will act much more wisely in purchasing a saddle well padded before and behind, and stuffed, than in running risks and making themselves ridiculous on a smooth plain hunting saddle. A great many attempts have been made to produce an elastic saddle, but with moderate success. Except for a very heavy man, an elastic saddle is a mistake. Steel springs, stretched webbing, and, lastly, caoutchouc cloth, have all been tried; but all the expedients for affording a soft seat have the same fault—after a short time the springs break, the webbing or India-rubber cloth stretches, and the saddle is spoiled. Good stuffing, covered with a thin waterproof cloth to protect it from the effect of a thorough wetting, will continue to form the best seat, until some mode is invented of removing worn-out bands. A saddle tree is exhibited, covered with vulcanized India-rubber, which would perhaps answer as well as anything of the kind.

The best "old gentleman's" saddle in the Exhibition is (No. 79) by John Weir, of Dumfries, which is made of one piece of buckskin, without flaps, wadded, but so edged with hogskin, that when mounted the rider's person covers all the white leather. It would be very comfortable and easy to sit for the fattest man and clumsiest rider on common roads. The arrangement of the stirrups under the flaps would make it somewhat safe for hunting. Cox, of Walsall (55), has a new registered stirrup, which, although very ugly, is a move in the right direction, and would be an improvement to Weir's saddle. The stirrup hangs from a single strap, always in the right direction for use, and so obviates the necessity of groping with your toe for the stirrup after dismounting, just as your horse is rising at a tough bullfinch. This form would be an improvement for ladies' stirrups, where the stirrup leather is fastened on the offside; but Mr. Cox's arrangement of an improved buckle without a tongue is quite inadmissible, as it would come most painfully against the leg of the horseman.

Mr. Ramsey, Hull (74), shows an elastic saddle, with very high testimonials; but in this, as in many other instances, without a dissection first, and a long trial afterwards, it is impossible to say anything positive.

Hudson (80) and Lennan (81), both of Dublin, display excellent workmanship in hunting and steeple-chase saddles: they are neat and well cut, good material, and light. The 8lb. steeple-chase saddle of the latter is as good as anything of the kind in the Exhibition. But if our Irish friends wish to do any business in London, they must begin by undercutting the preposterous London prices. Any man who goes with money in his hand to one of the best saddlers has to pay at least £2 extra, because other customers take four years' credit. Colegrave, Brighton (97), has a saddle fitted with springs, attached to the girth straps (a patent), to avoid the dangers of over-girthing. It must be expensive, soon out of order, and rarely necessary; good girths are much cheaper.

A much better thing of the kind is in No. 101: a saddle by Gibson, of Coventry-street, fitted with Reed's Patent Girth Regulators. Every one knows the awkwardness of having to take up the girths a hole or two on the hunting-field, on a hot fidgetty horse, after a sharp burst on a moist woolly day. The flaps of the saddle are probably covered with mud; and, whether you dismount or sit on, you get the benefit of a streak of clay on your hands, your breeches, or your hat, while pulling at the girth tongues. By Reed's Patent, a small lever on the principle of a ship's capstan winds catgut, to which the girths are attached on a metal roller. The idea is extremely good. The girths may be tightened at cover side, or even when cantering along, without lifting up the flaps of the saddle; but the mechanical arrangement might be very much improved, and, for that end, we direct the attention of our Walsall and Birmingham readers to it.

Thomas, of Stratford-on-Avon (76), sends flexible saddles, which are said to yield to the motion of the horse, and yet allow a free current of air between the back and the saddle. This is very desirable; but without a trial it is impossible to do more than direct attention to the promise.

Although there are plenty of good hunting saddlers, there are no other hunting saddles displaying any novelty among the few exhibited. It is to be regretted that the Walsall manufacturers have not made the class more complete by sending the good plain cheap saddles which they manufacture so largely for the foreign markets, at from 20s. upwards.

Racing Saddles.—Jackson's (96) is but for form, workmanship, and weight, nothing can exceed the one exhibited in No. 30 by Mr. Cooper, of York. The whole case is highly creditable; and the racing saddle has been pronounced by one of the leading members of the Jockey Club the best he ever saw. This is worth noting because the maker has spent the greater part of his life in itinerating from farm to farm in the Dales of Yorkshire, mending cart harness, and is almost self-taught as to fine work and taste. His Somerset saddle, also, is a piece of right good workmanship.

Side-Saddles.—Of these a goodly number are displayed, chiefly differing from each other in ornament. Several have Berlin wool-work or tapestry let into the seat and the near-side crutch. There is something pleasing to young ladies in the idea of turning their eternal fancy-work to some useful purpose; but the fashion will be of short duration, unless a mode can be found of cleaning the red, green, and blue worsted flowers without damage. The same objection, in a less degree, applies to white buckskin coverings on a saddle. It requires time and trouble to clean, and is only fit for those rich enough to have more than one. The greatest improvement in side-saddles consisted in the introduction of the third crutch, or, as it is sometimes called, the hunting horn-pummel; if this be well placed, the inside of nursing

the solution of problems for the material and moral amelioration of his kind, far behind in the race, and the Osmanlis name a term of reproach which their character and genius do not deserve, and which they may soon redeem from the scandal. We would willingly and gladly accept the prognostic, and hope speedily to see Turkey emulating the most eminent nations of Europe in the pursuit of every useful and refining science; but we cannot altogether confess our reliance on the event being realised by the literary and poetic class, on whose past performances such a eulogy has been pronounced. We would rather place our reliance on a new growth, which this novel encouragement may educe out of the people. The past pertained to the artificial, the ideal, and the restricted; the future, to be worth anything, must pertain more to the actual, the real, the practical, and the expanding. The appeals must be to common sense and understanding; and not as heretofore, addressed to the nation, in so over-laboured and over-polished a manner, that not one in a hundred of the population could guess at a meaning. Yet these men are of fine minds; and it is by a combination of the poetic and reason, such as they are, with the more modern school—that is to say, by running side by side the ideal and the real, the beautiful and the useful, the imaginative and the active forces of man—the greatness of the Ottoman Empire will be harmoniously and beneficially developed, and an immense progress be made in the social advancement and welfare of the entire Mussulman world. At any rate, we may congratulate them that the seed is being sown, and the fruits of this institution cannot fail to contribute to their improvement and happiness. There are Turkish ladies to be seen in the Crystal Palace, and driving in open carriages, openly about the streets of London; and, at the same time, the Sultan is hurrying on the Council of Instruction, to complete the establishment of his Academy of Science. These, indeed, are signs of the times; and if will, we presume, interest European readers to be told somewhat more about this remarkable novelty. The meetings are to be held monthly, in the college, which the "Valideé Sultane" has recently built and richly endowed for the purpose, of which the names of the corresponding members. Transactions are to be promulgated, foreign works to be translated or edited, and a valuable library collected.

Such is the broad outline; and it may serve as a curious example of the human mind, variously called into action, if we speedily some of the leading members, and the qualities which have recommended them to this distinction; for which, by the way, a knowledge of languages, especially Turkish, Arabic, and Persian, seems to be an essential requisite. From the translation of books on art and science into the vulgar or common Turkish, a universal benefit is reasonably anticipated: the honours and advantages divided into three degrees, according to the merits of their productions, are to be accorded to the members whosemploy themselves on such works: the third will receive the profits of his book and a remunerative grant of money; the second, the prize settled on that degree, and his name, inscribed in the book of the privileges of the Academy, will descend to his posterity; the first will enjoy all the preceding privileges, and have the additional honour of an Imperial medal.

From the list of the forty academicians, we copy the following as illustrative of the foregoing statement:—

The Grand Vizier Moustafa Rechid Pacha.

Arif-Hikmet Effendi, Cheik-ul-Islam, learned in jurisprudence and distinguished in literature.

Muterdjim Mehemet Pacha, Minister of War, and conversant with many languages, and author of many works on government.

Mehmet Pacha, President of the Council of State, and writer of many books on morals.

Aali Pacha, Minister of Foreign Affairs; a highly esteemed poet.

Emin Pacha, General-in-Chief of Arabistan, of a European reputation in mathematics and science.

Ismail Pacha, Minister of Commerce, Agriculture, and Public Works; a doctor and member of the Academy of Medicine of Paris.

Sami Pacha, Inspector-General of the European provinces, and conversant with many languages and literature.

Youssouf Kiamil Pacha, member of the Council of State, and a distinguished literary man.

Mechreb Zaadc Arif Efendi (the Cazisaker aforesaid), an Arabian poet, and one of the most eminent *ulemas* of the empire.

Tahsin Bey, Nakib (or grand judge of the nobles), learned in theological and mystical science

Fuad Efendi, Counciller of the Grand Vizier; a poet of great merit, and author of many literary and grammatical works.

Ziver Efendi, Director of the Imperial School of Medicine, and an esteemed poet.

Lehib Efendi, President of the Chamber of Accounts, author of many statistical works.

Redjal Efendi, director of the printing-houses and censure, and historiographer of the empire.

Ahmmed Véfik Efendi, without addition to his name; but we may state, from personal knowledge of the most accomplished individuals, not only in this list, but in the Turkish empire, and with few rivals in the European world.

Lieut.-General Ethem Pacha, a mineralogist.

Lieut.-General Ismail Pacha, a connoisseur in the fine arts.

Lieut.-General Dervich Pacha, author of scientific works on mathematics and physics.

The Grand Judge Hassan Efendi, a celebrated professor.

Emin Moukhis Efendi, a philologist.

Noureddin Bey, Dragoman to the Divan†; a philologist, to whom the two principal languages of Europe (English and French, we presume) are familiar.

Sali Efendi, another distinguished professor in medical sciences.

Elias Efendi, a judge of the second class, and a theologian.

Tahir Efendi, a poet.

Colonel Nouri Bey, a distinguished *literateur* and linguist.

Ahmmed-Djevdet, a grammarian.

Professor Chakir Efendi, a highly renowned scholar.

The few remaining names are not so marked; but these will suffice to show how such matters are managed in Turkey; and how poets, doctors, and authors (some of them of no great fame) are respected and rewarded by barbarians, as we call them; yet the example might be advantageously followed among wiser and more pretentious people.

A dozen of the corresponding members are also mentioned, among whom we noticed the "learned Davoud Pasha, Governor of the Sanctuary of Mecca;" Veli Pasha, Governor of Candia, conversant with many languages; several professors of the Grand University; Ebn-Sued, a able translator; Prince Vogorides; Messrs. Redhouse, Hammer, and Blanqui, and Dr. Stefanaki Carathéodory.

After all, what is the university even of living fame. We dare to say, that many of our own magnates, in literature and science, are as utterly unknown beyond their own spheres as these celebrities of the Ottoman Empire! The grand operation of national meetings, like this of the year 1851, if they can be, as they should be, repeated, will tend more to cosmopolitan union and prosperity than ten times ten thousand of the most eloquent treatises that ever were or could be written; and, as many extreme exertions of individual devotedness or government influence in different countries, without a common tie, or the transfusion of a common sentiment for the mighty and desirable common objects of peace, goodwill, and mutual brotherhood. Well did Burns, as it were, prophetically sing—

> Then let us pray, that come it may,
> As come it will for a' that,
> When man to man the world o'er,
> Shall brothers be an' a' that!

It is delightful to contemplate the actual efficacy and the probable results of this unparalleled assemblage of the Crystal Palace, in these two distinct, yet conjoined points of view; and on the mingled together, as of a similar nature and tendency, the intellectually elevated and the practically useful—the future possible, and the absolutely immediate. Let no man think the imaginative and the utilitarian unconguinal, and, far less, antagonistic interests. The inventive is as potent as the inductive, and they are destined to work both together for the good of mankind. In our last Notes, we deduced lessons of wisdom and love from the inspiration of flowers, and their exquisite mechanical resemblance; thus combining nature and art, and teaching that each was to be cherished for improvement and instruction. As Charles Swain has charmingly expressed it—

> Have not the flowers a language? Speak, young *rose*,
> Speak, Spanish *jessamine*, thy restless cell!
> Thy blooming loves, thy sweet regards disclose:
> Oh, speak! for many a legend keep'st thou well.
> Old tales of fragrance, knights who fell,
> And bade thee minister their latest sighs!
> Speak, greybaired *daisy!*—ancient *primrose*, tell!
> In vernal barge I ye sylvan harmonies!
> Speak, poets of the fields! rapt gazers on the skies

And this flows from Manchester, the great nurse of mechanical invention and industry! If it can be also sweet and redolent in poetry, as it is astounding in the noise of machinery, and almost appalling in the double-handed power of innumerable engines, does it not offer a pregnant model of the truth of our present theory, that there is no quality of mind imprinted by the almighty Creator on the human species that is not destined to contribute to the well-being of the whole. As we have quoted the Swain as an example of refining thought, so will we close this paper with a notice of the wonderful advance of ingenuity in the application of the scientific and useful. We have already the lightning speed applied to motion and the transmission of language again in combination of the real and the impalpable; and what will be thought of the same agency being adopted for the stoppage of motion and the cessation of speed! Yet so it is. Electric [illegible] is about to be introduced, not to accelerate railway trains [illegible] but [illegible] superior to all breaks, and the [illegible] of [illegible] for enabling the conductors to bring them softly and certainly to a stand-still whenever expediency or necessity requires that measure. The experiment has been successfully tried, and, we have little doubt, can be employed on the largest scale. Wheels can be instantaneously converted by the person in charge of the carriages into electro-magnets, the effect of which upon the railway line will be to afford an additional grip and power for ascending inclines, drawing loads hitherto intractable; and, when used on levels or descents, from the certain hold imparted to the train, bringing, as we have intimated, the headlong mass to a gradually diminished celerity and a well regulated stoppage within an, exceedingly short distance—a distance, in fact, as short as is consistent with absence of concussion and damage.*

MARTINUS SCRIBLERUS.

* The establishment of a model farm, *à la* Mochi, at Bucharest, with agricultural implements selected from the Crystal Palace, may be cited as another pregnant instance of progress.

PLUMMER'S PATENTED MACHINERY, USED IN THE MANUFACTURE OF FLAX, &c., NO. 74, CLASS 6.

The machinery exhibited by Mr. Plummer, of Newcastle-upon-Tyne, is highly interesting at the present time, when the culture of flax is likely to be carried on to a great an extent in the sister country. The whole process of flax-dressing was carefully shown to us by the obliging and intelligent person exhibiting the machinery on the part of Mr. Plummer; and it was not a little interesting to have been present when the great and illustrious Captain of the age received his lesson in the useful and important art of manufacturing flax.

In the first place the plant is shewn r- taken from the field, and subsequently in its various shapes and conditions, until completely manufactured for the market.

The first part of the process is to place the flax in cold water, and gradually to raise the temperature during twelve hours, until it reaches 90 degrees of Fahrenheit, at which temperature it is kept for 48 hours more. It is then taken out, and properly dried: when thoroughly dried, it is passed into the *crushing* machine, which consists of five indented rollers, rotating horizontally.

After undergoing the operation of crushing, by which all the fibres of the plant are broken up, it is taken to the *Scutching* machine, having a large disc of yellow pine 6 feet in diameter, which is made to rotate at a sufficient rate of speed to *scutch* the flax effectually. The discs attached to metal arms, and is divided on either side into six compartments, each containing two brushes, thereby working double. The brushes differ considerably in construction, the first is 3 inches long by 4 inches wide, consisting of wire ½ of an inch long, and of the description known as No. 22, Birmingham wire gauge. The second brush is of the same dimensions as that already described, but instead of wire is made of strong whalebone. The third brush consists of whalebone and leather alternately; and the fourth brush is made up of three and a half inches of wire and one part of whalebone. Thus, there are altogether 24 brushes. Two boys are employed in this part of the process—the one handing the material to the other who receives it, being first used

Heckling is the next part of the process. This is performed by placing the material into the double oscillating cylinder heckling machine, in which it is suspended from short moveable arms, to undergo the operation of heckling, which is effected by ten rows of needles and brushes, divided equally, so as to intersect each other throughout the distribution in the cylinder. Some of the wires, which project 1¾ of an inch, are placed six to the inch, while others are placed eight to the inch. The holders have checks of gutta percha, which are found to last out six of those ordinarily used. In front of the machine are three boxes or receptacles for three descriptions of tow, which passes down from the cylinders by means of an endless chain or series of round wooden bars.

The whole of this machinery is kept in motion by one of Hodge's four-horse engines

Mr. Plummer also exhibits good samples of "all long" flax canvass, made from flax dressed by his patent machinery, and manufactured by Agnes Scott.

There are also exhibited slips of canvass 1 inch wide, whose strength has been tested to 490 lb. for the warp, and 560 lb. for the weft.

TO CORRESPONDENTS.

FAN—The only arms to the name of Paxton registered in the Heralds' College are, we believe, those granted May 13, 1806, to the family of Paxton of Watford-place, Herts, and Middleton-hall, county of Carmarthen, which family derived descent from ancestors resident at Berwick and on the Borders. The arms to which we refer are, "Sem. two chevrons, one above the other, az. in pale, three mullets of the second. *Crest:* An eagle's head erased argent, charged on the neck with two chevrons or, between a pair of wings az. Motto of the first: "Deus ex Fide." The Sir William Paxton, of Middleton-hall, M.P. for Carmarthen, was younger brother of Archibald Paxton, Esq., of Watford-place, Herts, who died in 1817

AN AMATEUR, R WILSON, F G M, Edinburgh; SNOWFIRE.—Wandle's Cases may be ordered at any nine works; and the plants may be had of Loddidge, Hackney; or Veitch, Exeter

J W P.—We believe that there is no positive law against an uncertificated bankrupt acting as a trustee; but, no doubt, a court of equity would prevent such a person from so acting, if applied to by the cestuis *que trust*

AN INQUIRER.—A marriage license in the diocese of Exeter may be obtained from the Bishop's proper officer there, and the cost of it is known. Such license is only available in the parish where one of the parties to be married has abided for fifteen days prior to the grant of the license. This, of course, does not apply to the special license of the Archbishop of Canterbury

F M.—Impaled coats of arms may be used by the husband and wife on seals.

H Y Z—One-third to the widow; the residue among the children

H H, A SUBSCRIBER.—The question relates to a private affair; a solicitor should, therefore, be consulted

A Z—By the 15th Geo 3, c 51, and the 48th Geo 3, c 68, s 1, *all* bills and notes for sums under 20s are void

R P—The ordinary marriage license is that of an Archbishop, or Bishop in ordinary, which permits the marriage to take place under certain statutable restrictions, such as confining the ceremony to the parish where one of the parties has abided fifteen days prior to the license. The special license is that of the Archbishop of Canterbury, when he exercises his power which he has of granting special licenses to marry at any convenient time or place.

G L—The widow, in the case of their being children, is entitled to one-third of her intestate husband's personal property. Under ordinary circumstance, administration will, in preference, be granted to her. The widow has also a right to the third part of the real estate of inheritance which her husband may have had in possession during the marriage, unless this right, which is called dower, be barred by one of the many impediments to it which the law provides. We believe the law on these subjects is the same in Kent as elsewhere in England

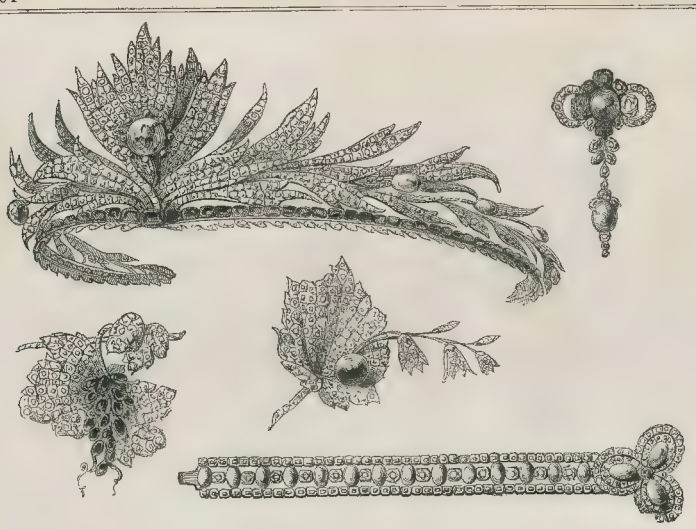
A SUBSCRIBER.—The Marquis de la Force, who commanded the Huguenots, at Rochelle, was, we believe, the same person who was afterwards made a Marshal of France and a Duke. [illegible] the House of Commons, Dukes and Marquesses de la Force, are, "Az. three *Bezants* palewise or langued armed and crowned gu."

A BACHELOR.—Yes, such entailed property will be subject to legacy duty. See the 36 Geo 3, c 52s. 19

M L, Preston.—If a letter, bearing two penny postage stamps, be too late for the regular London post hour of half-past five, the addition of one halfpenny will enable you to get your letter off until six o'clock. In this case three postage stamps are of more use than two. Linkshid is a city and county of itself, although locally situated within the county of Dublin. The Scots Greys are the 2d Regiment of Dragoons

A LADY.—The proper style of a Marquis is "Most Honourable," of a Duke, "Most Noble." The latter is likewise styled "His Grace"

VIATOR, North Shields.—Lady Caroline Stanhope, sister of the Earl of Harrington, married Edward Ayshford Sanford, Esq, of Knowstead, county of Somerset, on the 21st of June, 1841. Sir Rainald Knightley, Bart, died before, viz. Nov 4, 1817, to Henrietta, daughter of Sir William Leighan Bard, which lady died Augr 24, 1835. [illegible] Sir Rainald Knightley, Bart, is married to Julia, second daughter of Sir [illegible] Hare, Bart



GROUP OF JEWELS.—BY BOLIN, ST. PETERSBURGH.

JEWELLED FIGURE OF BRITANNIA.—BY E. H. AND D. GASS

This brooch is of very elegant design, in the cinque-cento style. Under the portico of a Gothic arch, the figure of Britannia, holding with her right hand a trident, and her left resting on a rudder, stands on a shell, emblematical of her sovereignty over the seas. Beneath the shell is a winged dragon, representing the evil spirit of anarchy being expelled from peaceful Britain. The figure of Britannia is composed of upwards of 400 small brilliants, of old English cut, of the remarkable size of 250 to the barat; the comb of the helme and rudder are set with small rubies; the two pieces on either side of the figure are cut from a single piece of carbuncle. The remainder of the brooch, with the dragon, is partly enamelled, and partly set with brilliants. The whole contains nearly 1000 stones, and the workmanship is of the most admirable character.

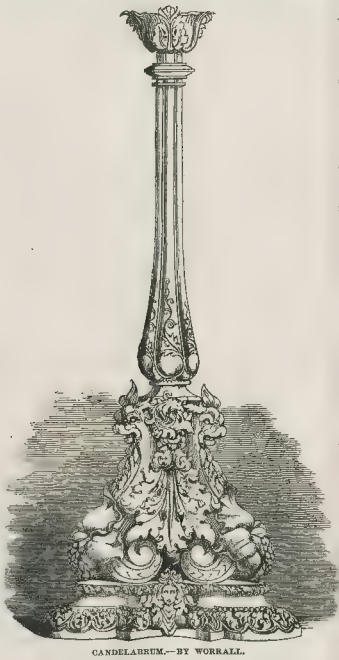
GROUP OF JEWELS. BOLIN AND AIN.

The group of jewels displayed by Messrs. Bolin and Ain, of St. Petersburgh, and which we have engraved, is justly an object of general admiration, both with artists in this line, and the general public. The principal piece is a diadem, containing 1800 brilliants, weighing 260 carats, and 1750 rose diamonds, in all 3600 diamonds, 11 opals, and 67 rubies. The diamonds are all of the first water, the opals some of the most beautiful we have ever beheld—the large one in the centre being, perhaps, remarkable for its rich and varying hues: the rubies are all well matched in colour, a matter very difficult to attain with this stone; the workmanship is of a high order; there is no silver employed in the mounting, all the stones being set *en griffe*. This, though a distinction which perhaps only a working jeweller will understand, deserves to be mentioned. The value fixed upon this diadem is £4800.

CANDELABRA IN THE RUSSIAN DEPARTMENT.

In a recent Supplement we gave Engravings of the magnificent malachite doors and vases in the Russian court: the candelabra, of varied forms, are equally objects of admiration in this department. They exhibit a splendour of material, bronze gilt, a *grandiose* character of design, and a masterly finish, which one might almost pronounce it to be impossible to excel. The largest one, by Chopin, of St. Petersburgh, which stands about 15 feet high, and is intended for 81 candles and four candle lamps, is valued in the Catalogue at £633 6s. 8d.

GROUP OF RUSSIAN CANDELABRA.



CANDELABRUM.—BY WORRALL.

A very creditable design for a candelabrum, very effectively carried out

London: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by William Little 198, Strand, aforesaid.—Saturday, September 6, 1851.—Supplement.

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS

VOL. XIX.] FOR THE WEEK ENDING SATURDAY, SEPTEMBER 6, 1851. [GRATIS.

THE GREAT EXHIBITION.

In order to clear away some of the mass of Engravings which our Artists have made of objects in the Great Exhibition, we this week present our readers with an extra Supplemental Sheet, which is little else than a picture gallery of industrial products. The objects embrace almost every variety of manufacture, furniture, plate, porcelain, grates, cutlery, and other hardware, house decorations, lace, damasks, carpetings, life-preserving apparatus, &c., besides some few specimens of sculpture and *certè*. We shall notice some of the principal groups here, reserving a few occasional lines for individual subjects in the course of the subsequent pages.

In SCULPTURE we have first to remark upon Mr. E. B. Stephens' group of "Satan Vanquished by St. Michael." This composition which stands on the left hand in the South Transept, is not without merit, though it certainly does not attain that high poetic character which we look for in works of this class. The subject is severely treated; the Archangel stands erect, without any attempt at attitudinising, whilst the enemy of man, whom he has just overthrown, crouches in the dust beneath his feet. There is a total absence of human passion in the expression of the face; a point in strict accordance perhaps with the heavenly nature of the personage represented, but which, on the other hand, would impose upon the artist the necessity of realising the supernatural dignity attaching to him—a task in which he has not been successful. A word with regard to accessorial details. It is certainly recorded that the Archangel brought down a chain from heaven to bind the serpent; and in a work of sculpture commemorative of the event, some reference might properly be made to it, as being by no means unimportant: but, at the same time, we could have wished that the said chain had not been made quite so much of, and in such hard angular outline as Mr. Stephens has employed; that it had been at most faintly indicated as encompassing the prostrate evil spirit, and not held up in triumph, in the hand of the Archangel. All such efforts at perfectionising petty details are unworthy of art, and betray a want of confidence in its higher resources.

Geest's group of the "Massacre of the Innocents" is treated as a religious allegory, rather than as an historical event, and is of a class of art better adapted for an altar-piece than a public exhibition-room.

As a *caprice* of art, of which the "Fine Art Court" is not a little proud, we must pay our respects to Luke Limner's "Shakspeare's Shield," or rather table-top, for to that useful purpose is it destined. The centre is an illustration of "All the world's a stage," over which mankind is passing from infancy to old age. In the original, the back scene is graduated from light into darkness, whilst through a crevice is seen a glimpse of celestial bliss. Folly prompts the ways of the world, whilst good and evil genius play. The centre is surrounded by a border of roses and thorns, and the seven stages are divided by the tree of life, in various stages, from the germ, bursting the ground, to the withered trunk, all but extinct; and crowned by hour-glasses, through which the sand runs out.

We have several specimens of lace, both of foreign and British manufacture. Of the former, Brussels maintains its old position of superiority; but that of Switzerland is very beautiful, and the manufacture is now becoming important there, employing a great number of hands. The embroidered window-curtain from Switzerland is extremely elegant. The original is suspended from the pillar immediately in front on entering the Swiss department. It contains a panoramic view of a Swiss village. This, and other contributions of like character, have been sent in by J. T. Sutter.

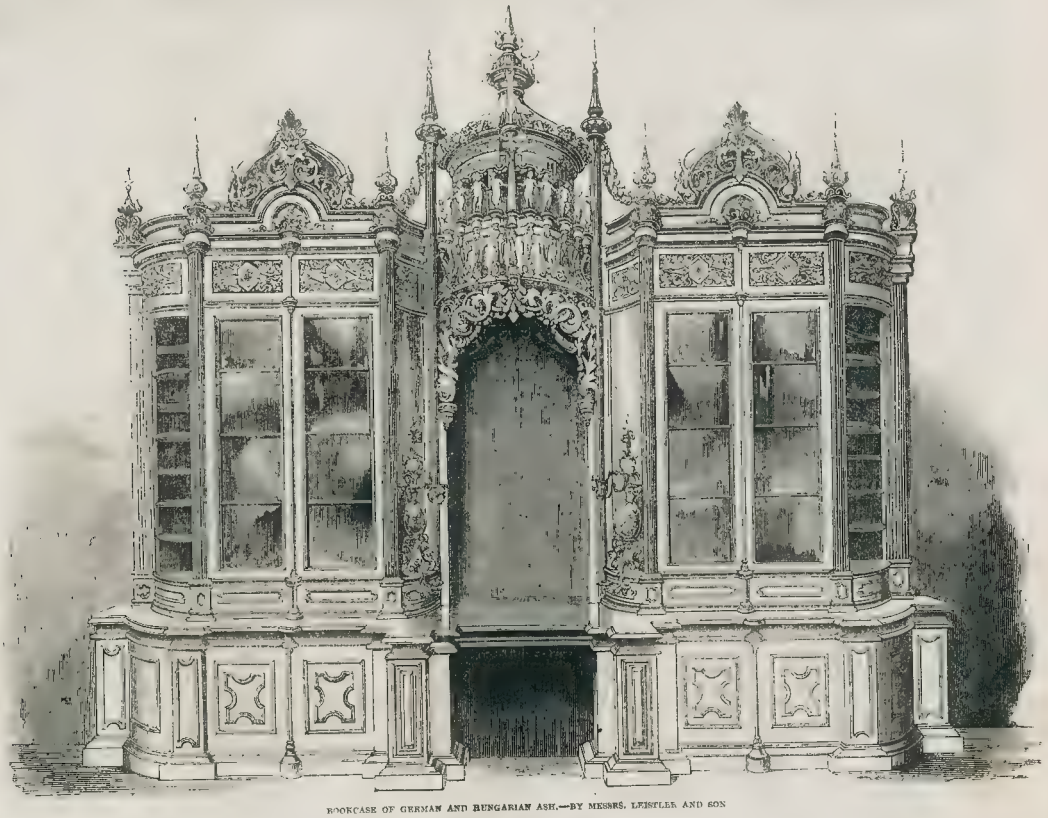
Urling and Co. exhibit a white lace scarf, worked in imitation of Brussels point, the straight lines in the border, and the date 1851 in the centre, embroidered in gold, surrounded by the rose, thistle, and shamrock; the whole is worked upon a fine clear net, for which this house obtained a patent some thirty years since; the body of the scarf is composed of a variety of British plants and flowers, tastefully arranged, and very clearly defined. For similar specimens exhibited at the Society of Arts in 1849, Messrs. Urling and Co. obtained the prize medal, presented by his Royal Highness Prince Albert.

Haywards (Biddle and Co.) have several magnificent productions in Honiton lace, two of which we have engraved. The one represents the arms of her Majesty and Prince Albert, encircled with wreaths of palm and olive branches; around which the rose, thistle, and shamrock are entwined; the whole being enclosed in a border of oak. The other is a very pretty berthe, of a light foliage pattern.

Recklass and Hickling have, also, a very handsome display in this line.

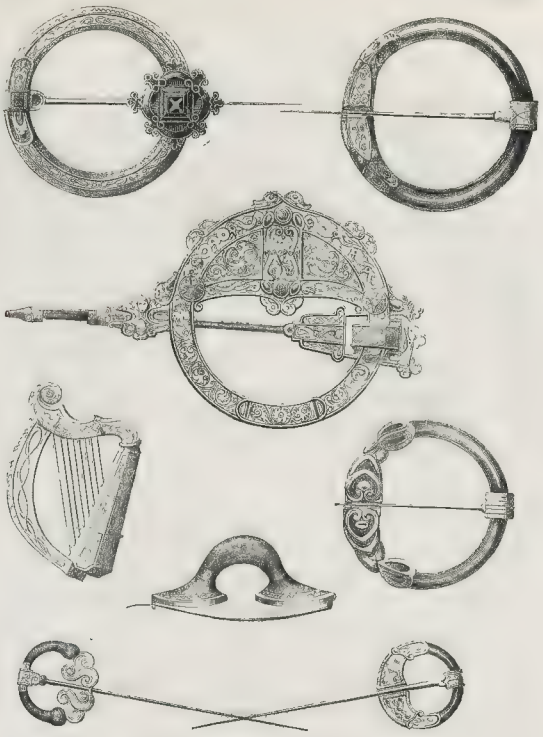
Pelling and Co., of Belfast, exhibit several very elegant examples of embroidery or sewed muslin work, the designs being bold and effective, with a certain amount of originality when seen in the fabric. There is a departure from the ordinary types in vogue for this kind of work, and the designer has taken a freer range than usual. The work is of a very excellent character, and the arrangement of the lines and masses tells well when seen in the fabric.

Amongst the works of furniture, the stately carved bookcase, by Leistler, claims especial attention for its elaborate and ambitious design and the careful workmanship bestowed upon it.



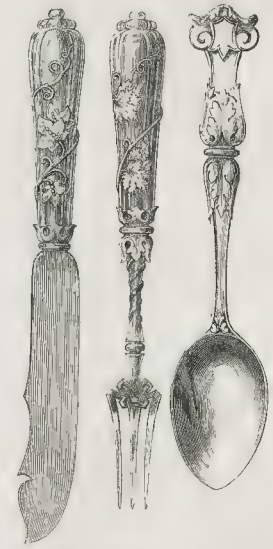
BOOKCASE OF GERMAN AND HUNGARIAN ASH.—BY MESSRS. LEISTLER AND SON

JEWELS.—BY LEVY FRINS, ANTWERP



IRISH BROOCHES.—BY WATERHOUSE, DUBLIN.—(SEE "LADY'S GLANCE," AUG. 23.)

IVORY CHESSMEN.—BY STAIGHT, OF WALBROOK.

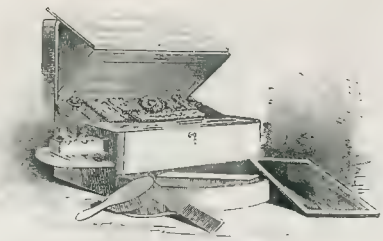


KNIFE, FORK, AND SPOON.—BY LIAS AND SON.

SILVER SOUP TUREEN.—BY ODIOT.

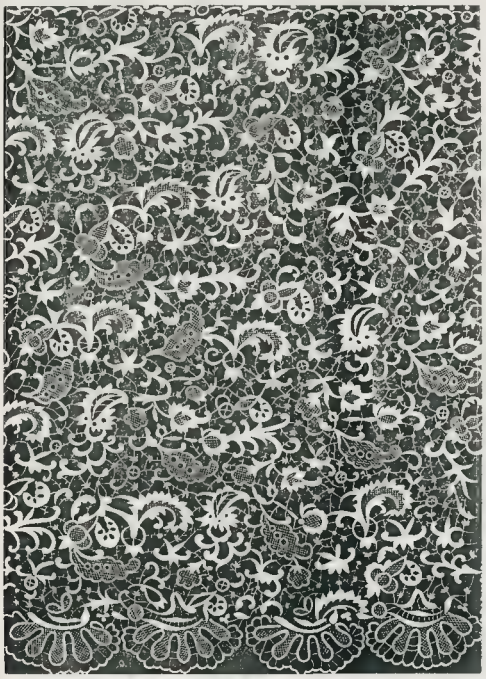
The silver soup tureen, by Odiot, is extremely elaborate in design, embracing almost every variety of vegetable and animal life; the execution and finish are of the highest class.

SNUFF-BOX OF BOG OAK.—BY WATERHOUSE, DUBLIN.



DRESSING-CASE.—BY MEATH.

SILK PATTERN.—BY MR. BOYD, SPITALFIELDS.



LACE FLOUNCE.—BY JAMES FORREST AND SONS, DUBLIN.

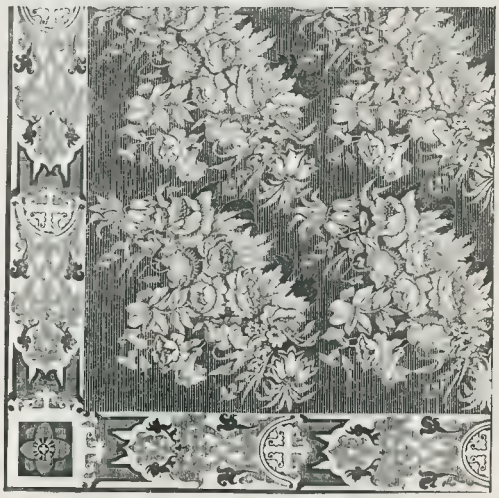


TABLE-COVER IN SILK AND WOOL.—BY W. BROWN, HALIFAX.

LACE LAPPET.—BY JAMES FORREST AND SONS, DUBLIN.

BIJOU PATTERN.—BY CORNELL, LYELL, AND WEBSTER, ST. PAUL'S CHURCHYARD.

LACE LAPPET.—BY JAMES FORREST AND SONS, DUBLIN

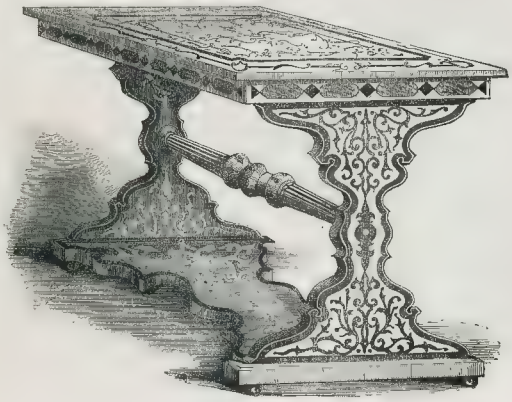
PAPIER MACHE VASES.—BY MESSRS. WALTON AND CO.

These vases, in *papier maché*, by Messrs. Walton and Co., are generally of classic form; the devices varied and elegant, and the colouring extremely rich.

PATENT CANNABIC MANUFACTURE.—BY ALBANO.

This is another and a very successful sample of the application of the patent Cannabic, which we mentioned in our Supplement of the 23rd of August.

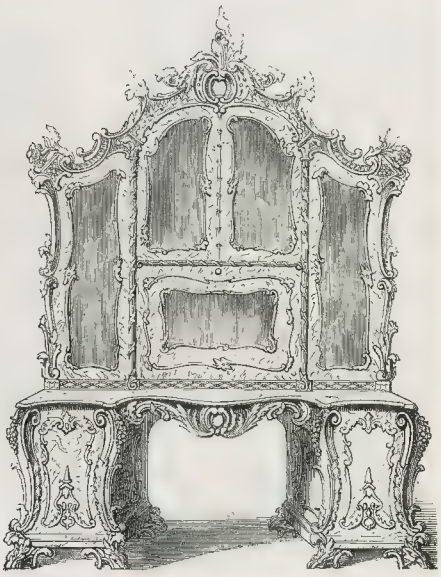
The patent slate tables, &c., by Magnus, claim attention for their substantial quality and rich appearance.



SLATE TABLE.—BY MAGNUS.

DAMASK.—BY R. C. M'CREA AND CO., HALIFAX.

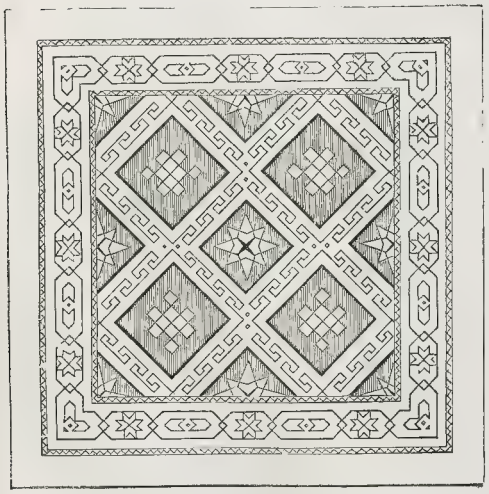
ORNAMENT FOR CEILING.—BY JACKSON, RATHBONE-PLACE.



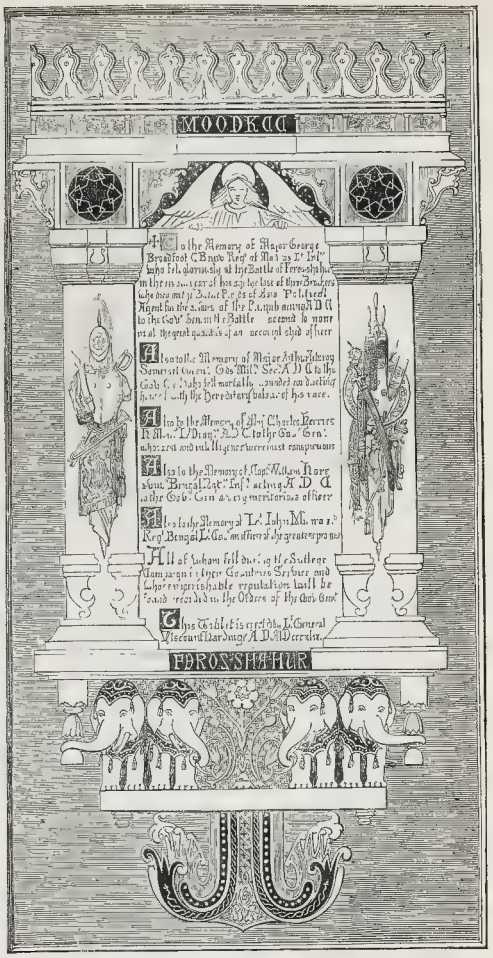
MONOCLEID CABINET.—BY SOPWITH, NEWCASTLE.

FRAME FOR PRINT.—BY MORANT, BOND-STREET.

PART OF A TABLE-TOP, ENAMELLED SLATE.— BY MAGNUS.



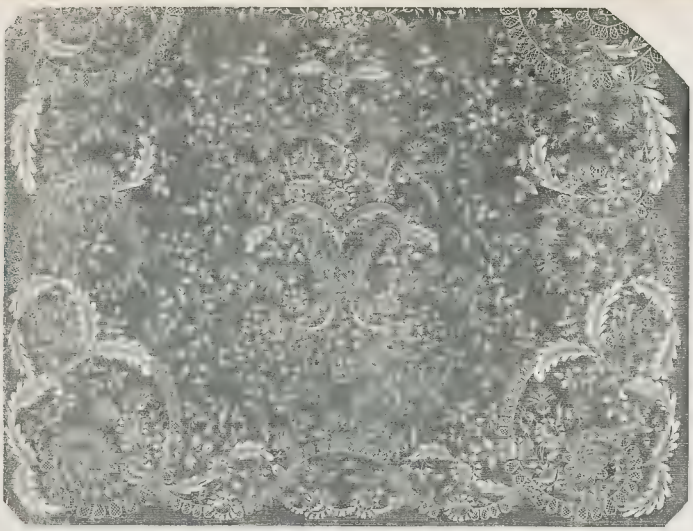
RUSSIAN PARQUETRIE, OR ORNAMENTAL, INLAID FLOORING



MONUMENTAL BRASS TO THE MEMORY OF THE OFFICERS WHO FELL IN THE CAMPAIGN ON THE SUTLEJ.—BY MR. J. W. ARCHER.

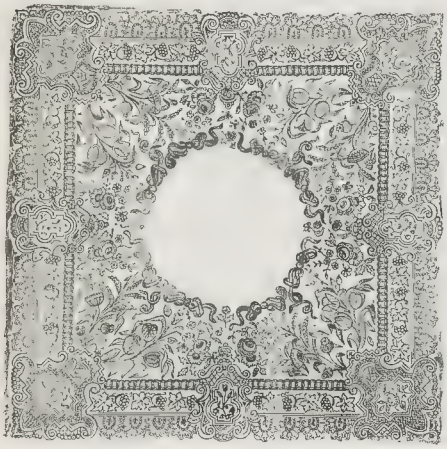
Sopwith's Monocleid Cabinet (engraved on the preceding page) is a very serviceable and well-made piece of furniture. It is made of black walnut wood – the upper panels being of silvered plate glass, ornamented throughout with carved gilt mouldings This cabinet contains a great number of drawers and partations, so arranged as to be especially serviceable for the keeping of various papers sorted, and the whole of them are opened by one turn of the key.

DESIGN FOR HANDKERCHIEF.



PORTION OF LACE SCARF.—BY RECKLESS AND BICKING.

LACE FLOUNCE.—BY C. L. BOY, BRUSSELS.



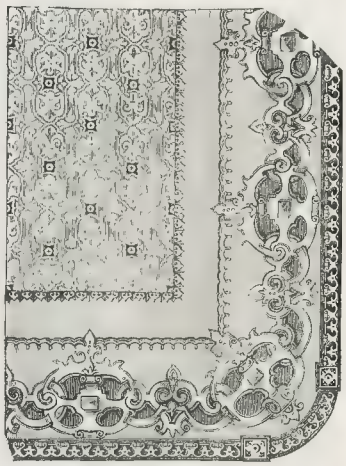
BRUSSELS LACE HANDKERCHIEF.—BY E. REALLIER.

BRUSSELS LACE.—BY A. DUCPETIAUX AND SONS.

QUILT.—BY SUDWORTH.

BRUSSELS LACE.—BY DUHAGON AND CO.

LACE.—BY MESSRS. BIDDLE, OXFORD-STREET.



PAPER PATTERN.—BY MESSRS. TURNER AND SON.

All the worlds a stage, And all the men and women merely players.
Exits and their entrance; And one man in his time plays many parts,
His acts being seven ages.
Then the whining school-boy with his satchel
And shining morning face, creeping like snail
Unwillingly to school.
Sighing like furnace, with a woful ballad
Made to his mistress' eyebrow.
Full of strange oaths, and bearded like the pard
Jealous in honour, sudden and quick in quarrel, &c.
Into the lean and slippered pantaloon,
With spectacles on nose, and pouch on side, &c.
Last scene of all
That ends this strange eventful history,
Is second childishness, and mere oblivion, &c.
First the infant,
Mewling and puking in the nurse's arms.
H.S. LEIGHTON, ENG.

SHAKSPEARE SHIELD.—BY LEIGHTON (LUKE LIMNER).

DAGGERS.—BY GUEYTON.

"ARCHANGEL MICHAEL AND SATAN."—BY STEVENS.—(SEE FIRST PAGE.)

MASSACRE OF THE INNOCENTS."—GEERTS.

PORTION OF A LOOKING GLASS.—BY PONSONBY.

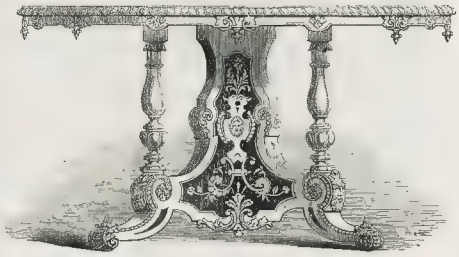


TABLE AND TOP.—BY BANTING, ST. JAMES'S-STREET.

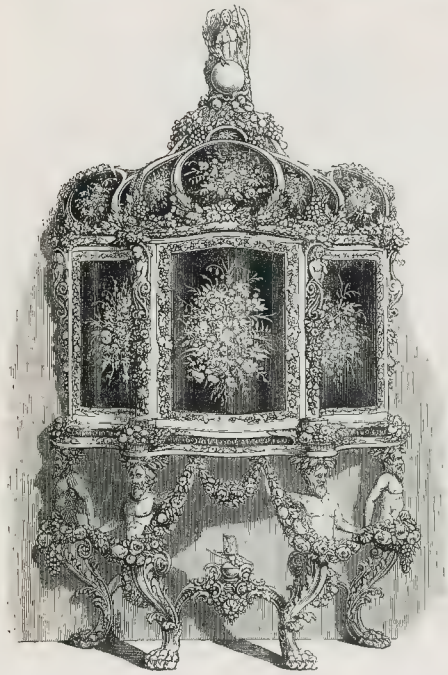
The circular marquetrie table, by Banting, must be set down as one of the handsomest and most successful works of the kind in the Exhibition. The design is picturesque and elegant and the workmanship is of the highest class.

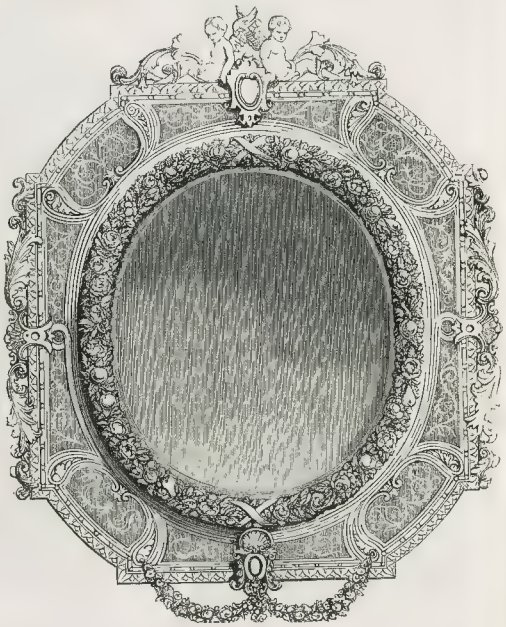
The cabinet by Stevens, of Taunton, is of a showy, fanciful character, of no particular style. It has evidently been a "labour of love;" the material, walnut wood, grown near Taunton, in Somerset; the panels of raised embroidery, and very pretty they are, by Miss Kingsbury, also, doubtless, of the same parish. After all, there is something pleasing and instructive in these original efforts of provincial handicraft.

SILVER TEA-SERVICE.—BY DODD.

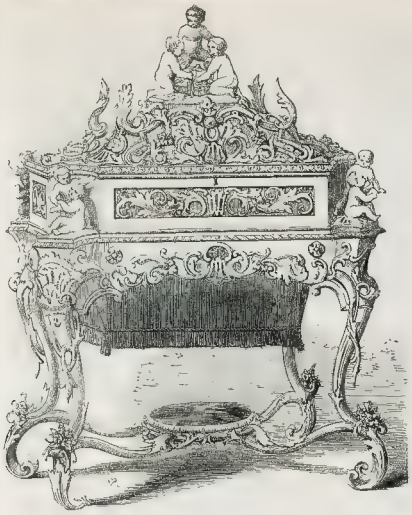
SILVER TEA-SERVICE.—BY DODD.



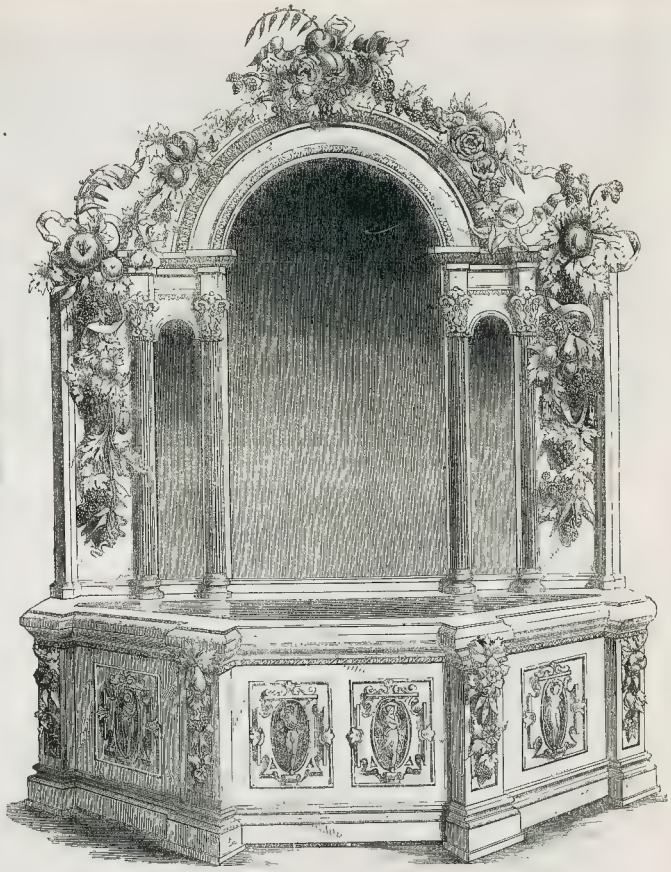
CABINET.—BY STEVENS, TAUNTON.



CARVED AND GILT FRAME, WITH ENGRAVED AND CHAMFERED GLASSES.—BY CHAMOUILLET.



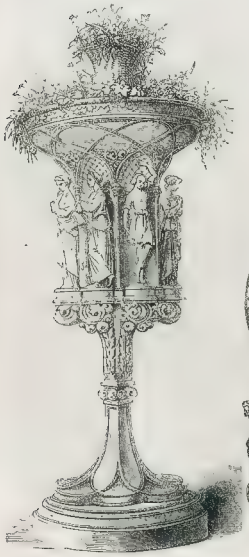
LADY'S WORK-TABLE.—BY WHITE AND PARLBY.



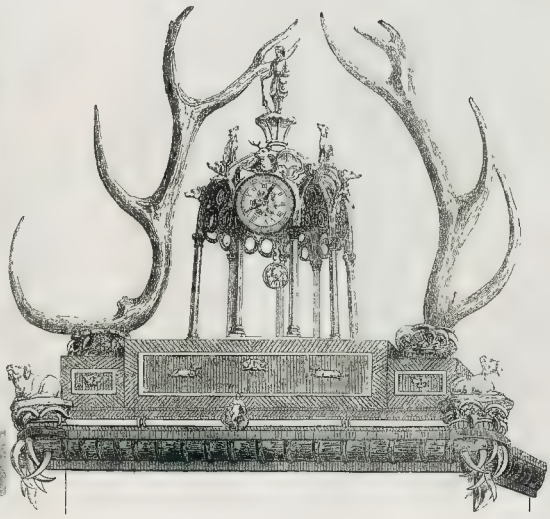
SIDEBOARD, GUTTA PERCHA COMPANY. (SEE PAGE 317)

LAUTUIL IN OAK.—BY JEANSELME.

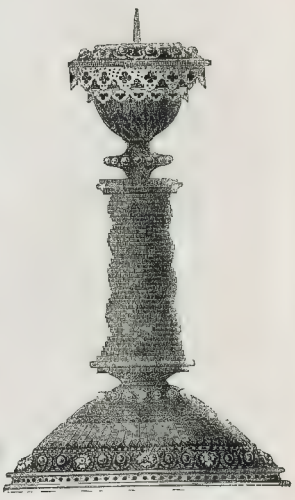
BRACELET.—BY LATELTIN AND PAYEN.



FLOWER-VASE.—BY JOHANN GASSER, VIENNA.

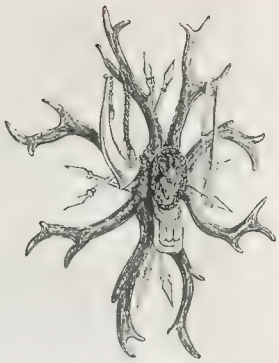


TOP OF A WRITING-BUREAU.—BY H. F. C. RAMPENDAHL, HAMBURGH.



CANDLESTICK IN WOOD AND IVORY.—BY W. D. KEMPHILL, M.D

LACE BELTHE.—BY BIDDLE, OXFORD-STREET.—(SEE FIRST PAGE.)



TROPHY ON HORN BUREAU.—BY F. H. C. RAMPENDAHL, HAMBURGH.

The writing bureau, by Rampendahl, of Hamburgh, is of characteristic appearance, the materials being chiefly horn, and the devices having relation to the chase.

SILK PATTERN.—BY SOPER, SPITALFIELDS.

SILK PATTERN.—BY HILL, SPITALFIELDS.

The candlestick by C. French (see next page) is very tasteful and original in design.

Bradford, of Clonmel, has a goodly assortment of steel-mounted daggers, in ivory and buck-horn handles; razors with carved handles, which exhibit excellent workmanship.

Houldsworth's damasks, the silk patterns by Soper; and the table-cover designed by Mr. Webb, are all highly creditable contributions in textile fabrics.

END OF LACE SCARF.—BY LEVING AND CO. (SEE NEXT PAGE.)

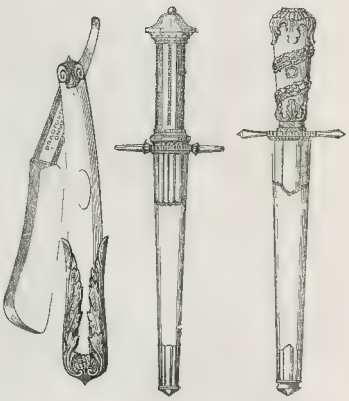
DAMASK.—BY MESSRS. HOULDSWORTH.

BLACK LACE.—BY VAN LOO, BRUSSELS.

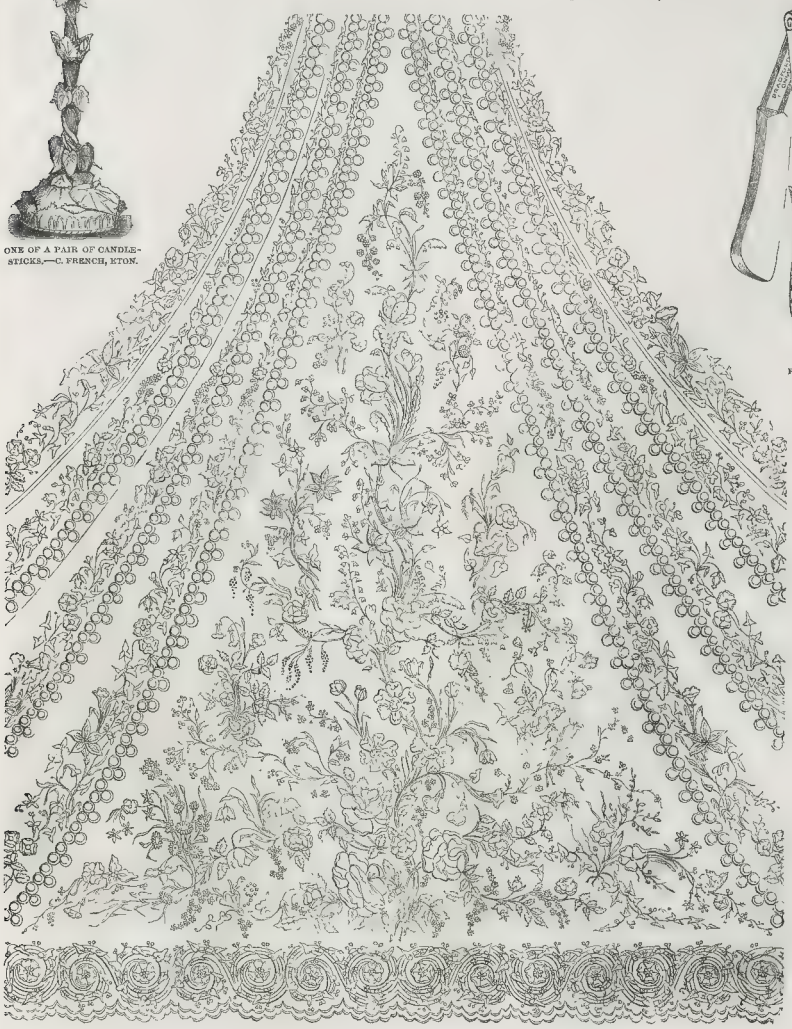
SILK PATTERN.—J. BOYD, SPITALFIELDS.

ONE OF A PAIR OF CANDLESTICKS.—C. FRENCH, ETON.

The glass-frame and side-board (engraved on page 313) exhibited by the Gutta Percha Company, is intended as a specimen of what may be done in their material upon a large scale, as a substitute for wood carving, &c. We must be excused from investigating its beauties as a work of art; as a piece of serviceable furniture, however, we have our misgivings about it, or any thing of the kind composed of this treacherous material. The card affixed to this sideboard announces that it is intended to exhibit the capabilities of this material for ornamental purposes, "particularly the long-sought-for desideratum of a non-fragile pendant." Unfortunately, although this highly-decorated structure in gutta percha is carefully surrounded by a cordon, and has yet experienced no wear and tear—we discover symptoms of dislocation in part of the "pendant" foliage, and something like a "split" in a pear of no ordinary dimensions.

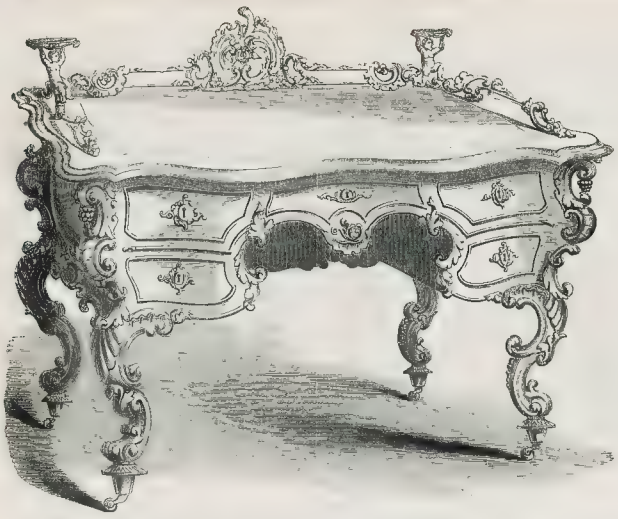


RAZOR AND DAGGERS.—BY BRADFORD, CLONMEL.



FRONT OF DRESS.—BY PELLING AND CO., BELFAST.—(SEE FIRST PAGE.)

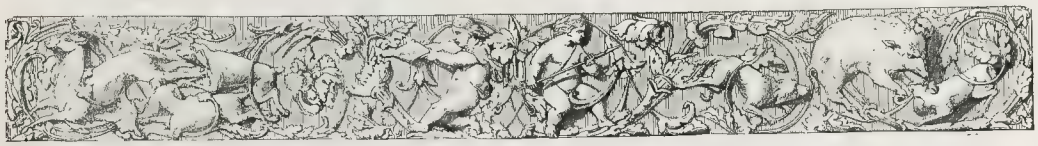
BR SHEET LACE.



ROSEWOOD WRITING TABLE.—BY C. B. HANSEN, COPENHAGEN.

WICKER SCREEN.—FROM HAMBURGH.

KEY.—BY FRETHAM.



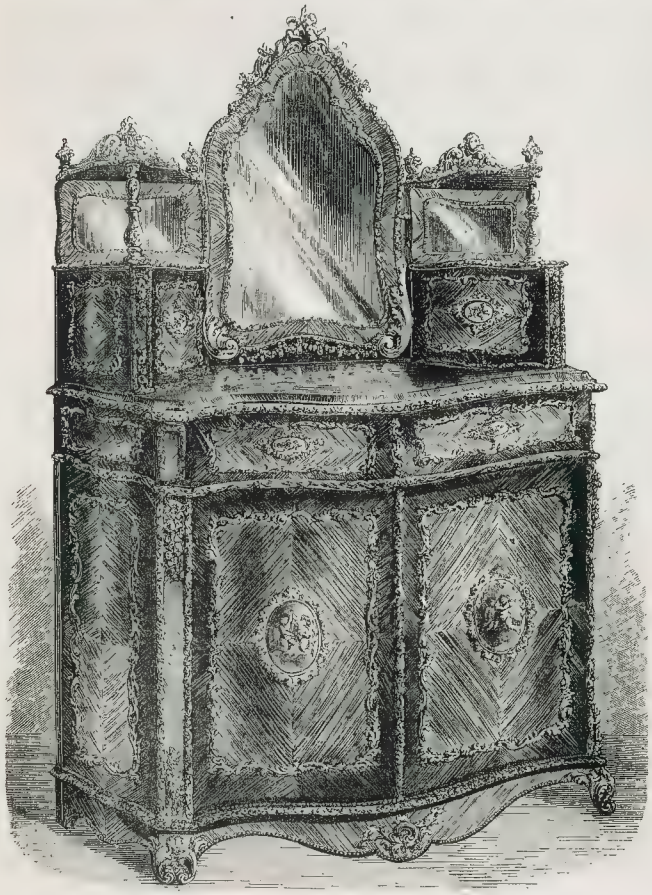
BAS-RELIEF.—BY MM. HARDOUIN.

The rosewood writing-table, by Hansen, of Copenhagen, is a good piece of workmanship of the Louis XV. period. Florange's toilet, in the Louis XVI. style, is very showy, with painted medallions and or moulu ornaments. The wicker screen, from Hamburgh, is a light and simple contrivance; the frame, of wicker-work, covered with silk.

The carved ornaments by Hardouin, of Paris, are extremely spirited in design, and executed in a free and masterly style.

Ponsonby's looking-glasses justly hold a high rank, for the excellence of the material and the taste in which they are turned out. The one we engrave is extremely pretty.

On the opposite page, Morel's silver looking-glass frame claims attention, as one of the most elegant pieces of boudoir furniture imaginable. Bailey's chandelier is of Gothic form, gaudily gilt, and painted in various colours.



TOILET, IN ROSEWOOD AND TULIP-WOOD.—BY FLORANGE, JUN.

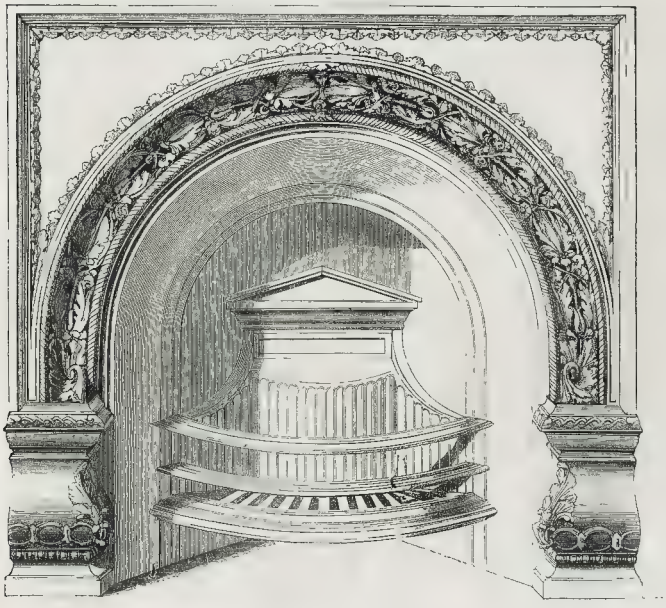
LOOKING-GLASS.—BY PONSONBY.

TOP OF LOOKING-GLASS.—BY BELLEMIE'D.

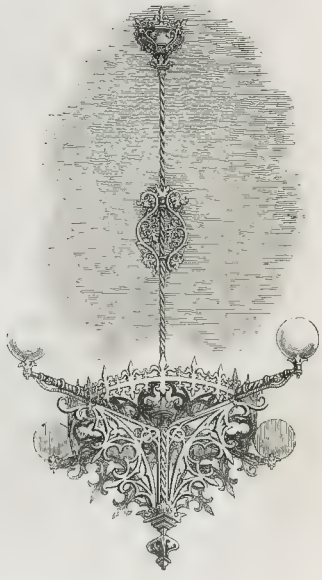
GOLD EMBROIDERY.—BY ABRAHAM.—(SEE NEXT PAGE.)

GROUP OF CHINA.—ROYAL CHINA MANUFACTORY, MEISSEN, SAXONY.

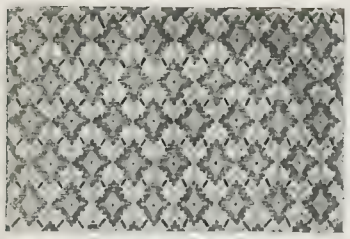
SILVER LOOKING-GLASS FRAME.—BY MOREL, NEW BURLINGTON-STREET.



STOVE.—BY MESSRS. HOOLE AND CO., SHEFFIELD.



CHANDELIER.—BY BAILEY AND SON, GRACECHURCH STREET.



TAPPET PATTERN.—BY SCOTT, CUTHBERTSON, AND CO.

DAMASK.—BY J. W. WARD, HALIFAX.

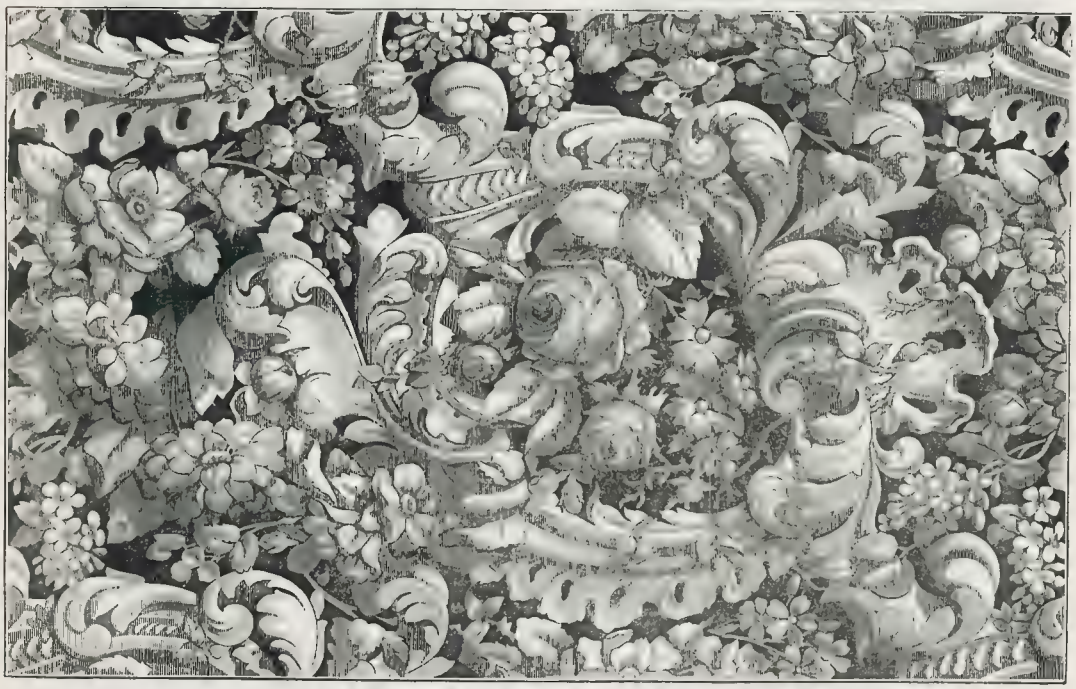
CARPET PATTERN.—BY SEWELL AND CROSS, OLD COVENTRY STREET, SOHO.

QUILT PATTERN.—BY MARSDEN, OF BOLTON.

The gloria and corner devices for a communion table, on the previous page, by Rebecca Abraham, is a fine specimen of embroidery, being wrought in gold threads, plates, pearls, spangles, &c., and containing upwards of 22,000 stitches.

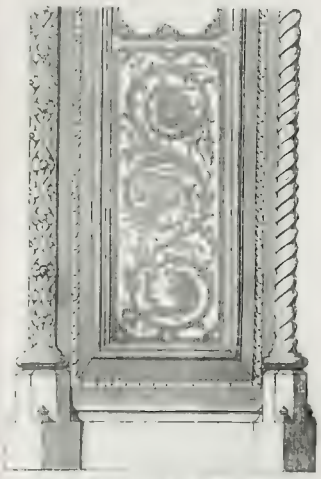
Bright's and Sewell and Cross's carpetings, and the furniture damasks by Ward, and by Brown, of Halifax, we have already mentioned with the praise to which they are well entitled. The specimens of these and other fabrics in these two pages are all of merit.

Jenkes's stove is extremely pretty.



PATENT LOOPED [illegible] CARPET.—BY E. BOAK AND [illegible]

PATTERN, SWISS SILK.—CANTON DE ZURICH.



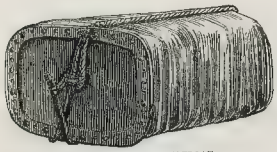
PATTERN ON STOVE.—BY JEAKES, RUSSELL-STREET

DAMASK.—BY BROWN, HALIFAX.

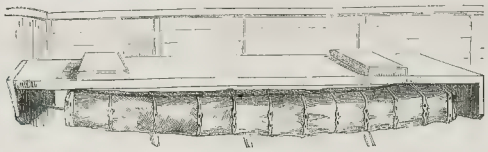
COVERLET.—BY C. STAFFORD WARD, ST. CARL,

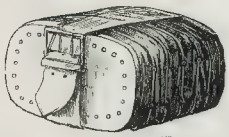
PRESERVATION OF LIFE AND PROPERTY IN CASE OF SHIPWRECK.

In class 8, eastern division of the Great Exhibition, bay P, are various articles, as illustrated below, patented by R. W. Laurie, who has granted a sole license for the manufacture and sale to S. W. Silver and Co., 66 and 67, Cornhill; 3 and 4, Bishopsgate-street, London; and St. George's-crescent, Liverpool, clothiers, outfitters, and contractors, where the articles may be seen and tested. The prices are very moderate, the disc body-floats being from 7s. 6d. each, and the mattresses from 9s. each, upwards. They consist of

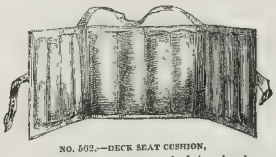


NO. 1.—CANVASS BOAT-FLOAT,
Which, distended under the seat of boat, as shown below, will prevent the possibility of the boat sinking.

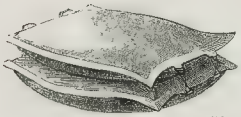


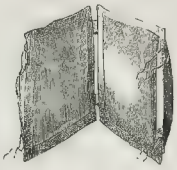


NO. 2.—DISC BODY-FLOAT,
Which, being distended round the person, becomes a preventive to sinking in the water, and is applied in an instant.



NO. 502.—DECK SEAT CUSHION,
Which becomes a life-preserver by being placed round the body, and may be applied in an instant.

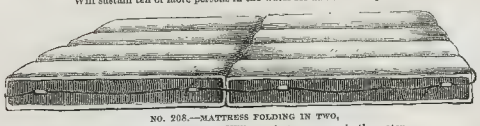




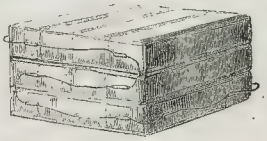
NO. 402.—DOUBLE PILLOW,
Which, when opened and placed round the body, will sustain six persons in the water.

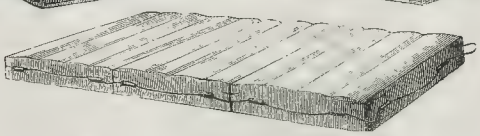
NO. 100.—EMIGRANT'S MATTRESS.
Will sustain six persons in the water.

NO. 104.—ORDINARY SHIP MATTRESS.
Will sustain ten or more persons in the water for an indefinite period.

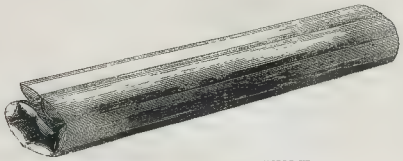


NO. 208.—MATTRESS FOLDING IN TWO,
For convenience of carriage. Will sustain ten persons in the water.

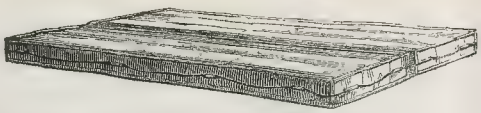




NO. 212.—MATTRESS FOLDING IN THREE,
For military purposes, and will sustain ten persons in the water.



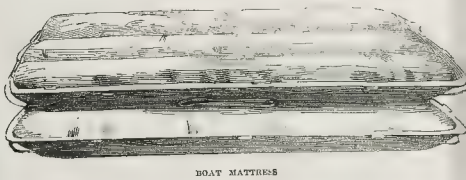
NO. 270.—HAMMOCK-BED, WHICH ROLLS UP.
Will sustain eight persons in the water.



NO. 250.—MATTRESS DIVIDING LONGITUDINALLY.
When opened, as shown in figure below, will sustain ten persons in the water.

N 280.—HAMMOCK AND BED IN ONE.
Will sustain six persons in the water.

NO 300.—BOAT MATTRESS,
As used for preserving life, forming a double mattress for sleeping on, as shown below; and will sustain twenty persons in the water.



BOAT MATTRESS
As used to sleep upon.

NO 600.—PORTMANTEAU,
Forming a life-preserver.

London: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by William Little, 198, Strand, aforesaid.—Saturday, Sept. 6, 1851.—SECOND SUPPLEMENT GRATIS.

THE ILLUSTRATED LONDON NEWS

No. 516.—VOL. XIX.] FOR THE WEEK ENDING SATURDAY, SEPTEMBER 13, 1851. [SIXPENCE.

THE INVASION OF CUBA.

THE Western World is in a ferment. A captain of banditti, one General Lopez, the same pirate or buccaneer who some time ago invaded Cuba with a band of congenial spirits, composed of the refuse of the American Union, and who, upon that occasion, unfortunately escaped with his life, has repeated his achievement, and landed in Cuba at the head of a force, which is variously estimated at from 500 to 700 men. Anticipating support from a revolutionary party supposed to exist in the island, and being provided with means and men by certain persons in the slave-holding states of the Union, Lopez has for many months been preparing for his enterprise. He and his followers and abettors made no secret of their intentions. A regular enlistment was organised at New York, New Orleans, and in other cities of the Union, and money was raised by means of bonds payable upon the conquest and annexation of Cuba, which illegal securities were as openly bought and sold as railway or dock shares in the markets of the Union. Nothing similar has been known in the world since the days when the Norwegian Kings set out on piratical expeditions to the more favoured climates of the south, to harry and to pillage, carrying fire and sword, and delivering up whole countries to the plunder of their buccaneers.

The American Government, as on the occasion of the previous enterprise of Lopez and his desperadoes, denounced the proceeding, and warned those who embarked in it that they would forfeit all right to the protection of the law, and that they were, and would be considered pirates. It told them plainly that they were mere robbers and murderers, and that the Cuban authorities would be justified in treating them accordingly. The warning was unheeded. Supported by the lax public opinion of the immoral and slave-holding South, and incited, not alone by the love of plunder, but by the very greatness of the attempt, which only required success to become immortal in history, Lopez and his men made their descent upon the peaceful and unoffending Cubans. By this time it is probable that not one of the band is left alive to tell the tale of what befell them. The authentic intelligence which has reached the Spanish Embassy in London, leads us to believe that they have fallen victims either to the summary vengeance of the outraged people of Cuba, or to the equally summary and inexorable process of military law. However this may be, fifty of them, caught apart from their comrades, or conrogues, have been publicly executed by the Spanish authorities, in the great square of the Havanna, under circumstances which rendered the act peculiarly memorable, as well as awful. A large section of the slave-holding party and populace in the southern states of the Union choose to designate this act of severe justice as an act of murder and atrocity. They state that the blood of American citizens has been cruelly shed, and are loud in their outcry against the Spanish authorities, forgetting the provocation given, and the slaughter which these fifty men and their comrades landed upon Cuba to commit. They appeal to every evil passion of the vilest mob, they incite animosity in public and in private, by meetings, by placards, by the press, and by all the agencies at the command of political agitators. The result is a perfect frenzy of ill-blood—a madness of the crowd—that has become contagious, and is rapidly spreading through the cities of the Union, infecting the middle and upper as well as the lower classes, and threatening the most dangerous consequences, not alone to the peace of the American continent, but to that of the whole civilised world. In the United States the central government is particularly weak, and the power of mob clamour particularly strong; and it is, unfortunately, but too probable that the fate of these fifty men—and in a still greater degree that of Lopez and his banditti, supposing them all to have perished—will appeal so strongly to the sympathies of the vast mass of the population in the hot South, as to urge the government, in spite of itself, to acts which may embroil the United States in a war with Spain. That such a war would be confined to these two belligerents, is not likely; indeed, it is scarcely possible. Whatever the Americans may think of the matter, Europe cannot, will not, and dare not allow Spain to be dismembered, to be robbed of her most precious possessions, and to fall a victim to the cupidity of the slaveholders of America. Great Britain could not hold aloof from such a struggle, unless she wished to be despoiled of

THE KAFFIR WAR.—DEFEAT OF THE TAMBOOKIES BY THE CAPE TROOPS, ON THE TABAKMHAKA MOUNTAIN.—(SEE NEXT PAGE.)

Canada and the West Indies, and would tamely consent to become a second or third rate power, to be overshadowed by the growing greatness of America. And even if Great Britain would consent to degrade herself, Europe could not consent that Spain should be sacrificed. The independence and integrity of the Spanish kingdom are necessary to the well-being and security of every state in Europe; and the war, thus begun, would, in a short time, involve all civilised powers in its dreadful vortex.

The present rulers of America have every motive for wishing such a war to be averted; but what makes the aspect of affairs so serious, is the utter absence of moral feeling which characterises the war party. Reason appeals to them in vain. Swollen with pride and insolence—strong in the youth of their vigorous Republic—accustomed to success—familiar with lawlessness—and ready on all occasions to make themselves both judges and executioners in their own cause—and by no means inclined to set limits to the gratification either of their cupidity or their revenge, to which evil passions they give the high-sounding name of ambition and glory, this party sets at defiance all those ideas of international right and equity which are prevalent in Europe. They are the highwaymen of nations, and their code is that of Turpin or Jack Sheppard. By their pressure upon the politics of the Union, they have annexed Texas, and have invaded and despoiled Mexico. California is the golden harvest which they last reaped. They are now only prevented from attempting to annex Jamaica, and from invading Canada, by the fear that, as yet, Great Britain is too strong to be safely attacked. They have no other objection to these achievements than that of present inexpedience or danger. They have already tried to involve England by exciting rebellion in Canada, and by making an unjust claim to the Oregon territory. They loudly proclaim that they bide their time, and that the day must soon come when all the European powers must be driven from the American continent and from the neighbouring isles. Mexico has been too easy a prey for them, and has been sufficiently humbled for the present. They aspire to nobler prey, and to more difficult enterprises. Cuba is a richer booty, of which the possession would not only gratify their insatiable lust for extension of territory, and the glorification of the go-ahead spirit so characteristic of that unscrupulous population, which adds the impulsiveness of southern to the energy of Saxon blood, but would tend to strengthen the slave interest, and to gain a domestic victory over the Northern States. Unless great tact and courage be shown on the part of the American Government, this greedy, restless, unscrupulous, and wicked party will inevitably lead the Union into a war with Spain. Such a war would be even more disreputable than that which was recently waged with Mexico; and no greater calamity could happen to the world at this time than that it should be commenced, and be successful.

We trust, however, that, ominous as things appear, this thunder-cloud will yet burst without doing serious mischief; and that, whatever may result, the instigators of the Cuba invasion will discover that a war with Spain for the possession of Cuba would be a war in which Spain would have Great Britain and France for her allies—allies more powerful than the justice of her cause. The American Government has done its best to counteract the evil spirit of its people, or, we should say, that portion of its people who indulge in the idea of conquest and annexation, and whose insolent and boundless ambition not only dreams of the expulsion of the English and Spanish from America, but casts a longing eye from San Francisco over the Pacific to Japan and China. But the American people must not be judged of by what Mr. Isaurite calls the *filibustieros*. The men of the Northern States have ideas more in accordance with those of Europe; and they not only abhor the slavery which prevails and is cherished as a domestic institution in the South, but they detest the rapacious and aggressive spirit which dictated some of the past wars of the Union, and which will force it, unless checked, into wars still more disgraceful, and possibly not so successful. The United States are not quite so united as to render them all powerful for mischief against their neighbours. Their own house is divided. Their Nemesis only sleeps, and is not dead: the blast of a war with Spain, or any other European power, could not fail to awaken her.

THE CAPE OF GOOD HOPE.

Intelligence of interest and importance to the 1st of August has been received this week from the Cape. The events since the last monthly mail may be classed under three heads; viz. a combined movement of the troops upon the Amatola Mountains; a subsequent irruption of the Kaffirs into the colony, and destructive ravages committed by them; and, finally, a reprise experienced by the British residents in the Orange River sovereignty, in attempting to suppress the sanguinary contentions among the native tribes of that province.

With respect to the first-mentioned occurrence, our previous accounts from the Cape stated that Sir Harry Smith was preparing, on the 21st of June, for an important movement, by which he entertained a hope of being able to bring the war to a close. The movement in question proved to be a simultaneous advance of the several divisions of the army (in all about 3000 men) upon the enemy's strongholds in the Amatolas. These operations occupied six days, from the 24th to the 30th of June, and resulted in the defeat and dispersion of some large bodies of the enemy, and the capture of upwards of 2000 head of cattle.

Under the second head, we learn, that the troops had hardly withdrawn from the Amatolas, when the Kaffirs and Hottentots descended from their fastnesses, and poured into the colony in overwhelming numbers. The whole country between those mountains and the village of Somerset was overrun by the hostile bands. At one time that village was himself surrounded by the enemy in the vicinity of a body of several hundred Kaffirs, under the chief Macomo. In answer to pressing demands for aid, Major-General Somerset, who had been engaged in another successful patrol in the Amatolas, was directed to proceed against the invaders within the colony. He accordingly removed his head-quarters from Fort Hare to Fort Beaufort, and has been, down to the date of the last advices, engaged in scouring the country in that quarter, and endeavouring to check the ravages of the enemy. In this object he has been only partially successful, the numbers and activity of the marauders being so great as to render the incessant and arduous exertions of his troops insufficient to restrain them. The efforts made by the colonists to defend their property have also been in a great measure unavailing. The wide tract of country between the Bavianns and Kat Rivers has been completely devastated; the dwellings of the inhabitants have been burnt, and, according to an estimate that has been formed, about 20,000 merino sheep, 3000 head of cattle, and 300 horses, swept away within the past six weeks. Several of the farmers have been killed in defending their homesteads; and many, desperate of relief, were withdrawing into the interior of the colony. Not a few, it is said, have determined to cross the northern boundary, and "trek," or emigrate, beyond the limits of the British dominions.

The difficulties of the Commander-in-chief have been much increased by the refusal of most of the colonial volunteers of the "Levies" to continue in the field after the expiration of their six months' term of enlistment, which expired at the commencement of July.

Under the third head of advices received, we are told that the British Resident, Major Warden, in interfering to check the quarrels among the native tribes, which were causing much bloodshed and devastation, has suffered a reprise, accompanied with great slaughter of his native allies. The defeat was experienced by a detachment of Major Warden's force, while assisting the chief of the Barolongs, Maroko, in an attack upon his enemy, Moletsane. The latter was strongly posted on a mountain, near the mission station of Platberg. The assailing force, consisting of 55 Cape Mounted Riflemen, with about twice that number of mounted burghers, and 700 or 800 Barolongs, advanced in three divisions, two of which were suddenly surrounded by overwhelming numbers of enemies, including 300 mounted Korannas, and were obliged to fight their way back to their camp. The Cape Corps and Boers accomplished their retreat without loss, but it is reported that more than a hundred of the Barolong warriors were slain. Major Warden on the following morning retired to a former camp, about twenty miles from Boom-plaats, in the Caledon valley, at the date of the latest accounts (July 14), in endeavouring to assemble a large force, principally of natives, in order to resume offensive operations. He expected to be joined by the chief of that nation by the 20th inst., and, with a force of more than 3000 men, but all the regular troops at his disposal were about 170 men, chiefly of the 45th and Cape Corps.

THE ILLUSTRATION.

The sketch engraved upon the preceding page is the defeat of the Tambookies on the Tambookie Berg, near Makai's Neck, on the north-eastern boundary of the colony. The mountain consists of thirteen or fourteen layers of horizontal rock, forming a succession of steppes to its summit, which is crowned by immense vertical crags, which, seen in a dim light, resemble some enormous castle.

A rugged track, used as a waggon road, crosses the Neck between the two peaks shown in the Sketch, and is sufficiently steep to cause any moderate pedestrian to halt often before he reaches the table land above. Nothing but the excitement of the fray could have lured our burghers up the sides of the hill; and it is fortunate for them that the enemy did not cast away his ordinary weapons and roll down masses of rocks upon his assailants. Had this been resorted to, scarcely a man could have escaped.

The accompanying private letter from an officer in command of one division of burghers, conveys a good idea of the engagement

"Bush River, Tambookieland, Monday, 14th April, 1851.

"We arrived here on Saturday, and yesterday marched with about 600 men against the enemy. We found him strongly posted on a high and rocky mountain, to the southward of Mackay's Neck. The Kaffirs fought bravely from behind ledges of rock, from which we drove them in succession, while as fast as we drove them from one they took possession of another, till they were finally driven out completely. About thirteen of the enemy were killed; some say twenty, but it is impossible to tell the exact number. One of our people, a man of Beadle's, was dangerously wounded by the thrust of an assagai, and one of the Fingoes slightly, but none were killed. Several of the deserters from the Cape Mounted Rifles were among the enemy, and fought right well—it is only a pity that they were not engaged in a better cause. This mountain, I have since ascertained, is 3000 feet high; that is, 8000 feet above the level of the sea. Fancy what the ascent must have been; I never was so fatigued in my life. But returning was even more difficult. The descent was so precipitous that we were obliged to help each other down, and where the ground was smooth to slide. We left the camp about dawn of day, and returned about eight o'clock in the evening almost famished. To-day more men come to Maseru, and probably will attack him in his stronghold to-morrow, having been joined by W. Shepstone with 400 Fingoes, which increases our force to 1200 men. The fight yesterday took place about six miles from the White Kie, which we crossed at the trader's station."

FOREIGN AND COLONIAL NEWS.

FRANCE.

Everything in the political world at present in France presents a most anomalous aspect. Under a Republic, we have this week promulgated in Paris an ordinance from the Prefect of Police which could only find a parallel in Austria or Russia. It directs all foreigners resident in the capital to present themselves at the Prefecture of the Seine, and obtain an official permission to remain, under pain of expulsion. The reason assigned for this extraordinary measure is, that foreigners, especially German and Italian refugees, have abused the hospitality granted them, by mixing themselves up in political schemes and conspiracies, hostile to the internal and external safety of the State.

The document is as follows:—

"Paris, Sept. 8.

"We, the Prefect of Police, taking into consideration Art. 5 of the decree of 12 Messidor, year VIII.; and the law of December 3, 1849, concerning the residence of foreigners in France; considering, also, that a certain number of foreigners, abusing the hospitality vouchsafed to them in France, engage in culpable manœuvres against the internal and external safety of the state; feeling, moreover, that it is incumbent on us to prescribe measures necessary to neutralise such proceedings, order what follows:—

Art. 1. Henceforward, every foreigner arriving within the department of the Seine for the purpose of residing there, or exercising any profession or calling, shall be bound to present himself, within three days after his arrival, at the Prefecture of Police, to obtain a permission to remain. This provision is not applicable to foreigners travelling for their pleasure or business, without any intention to reside, and provided with a passport from their Government *en règle*.

2. Foreigners at present residing in Paris, and not placed in the position alluded to in the last paragraph of the foregoing article, shall be bound to appear, within a delay of a week, at the Prefecture of Police (1st division, M. Bureau) to show regularise their position.

3. Any foreigner who shall contravene the preceding provisions shall be expelled from the French territory.

"P. Carlier, Prefect of Police.

"Approved of

"Léon Faucher, Minister of the Interior.

The greater number of the English resident in Paris, who feel that the order is not directed against them, it is generally thought, will not submit themselves to the annoyance of calling day after day at the Prefecture, amidst the thousands of foreigners summoned to obtain the *permis de séjour*; and, so far as they are concerned, the order will probably be disobeyed. It is also supposed, that the police have only issued it for the purpose of the more readily expelling certain persons, whose addresses are well known, and who will not venture to present themselves at the Prefecture, lest they should undergo interrogatories which would be very unpleasant to them.

The *Messager* says, that several foreigners long resident in Paris have suddenly quitted the city, in order to escape the probable interference of the Government, arising from their correspondence with the democratic committees sitting out of France. According to the same journal, the democratic plot occupies the constant attention of the Cabinet, and Ministers had sent several notes to the Helvetic cantons, complaining of Switzerland being the hotbed for political refugees of all nations. Forty out of the foreigners lately arrested, supposed to be implicated in a conspiracy against the Government, have been set at liberty, upon the understanding that they are to quit France with the least possible delay.

The last of the communal general, the result of whose deliberations remained to be known, has voted for the revision of the Constitution. The number of councillors-general throughout France, those of the Seine excepted, is 2753. The numbers that have voted for the revision in 68 councils is 1369, and no more. The number of revisionists in these 68 councils is 1384, and that of the non-revisionists, 617

The *Evènement* has been seized for an article headed "A Confession," and a prosecution is directed against the responsible editor and M. F. V. Hugo, the writer of the article, for exciting to hatred and contempt of the Government of the Republic.

M. Léon Faucher is appointed, *ad interim*, to the Ministry of Agriculture and Commerce during the absence of M. Buffet. M. Rouher replaces M. Buffet in the function of Minister of Public Works, *ad interim*, during the absence of M. Magne.

The prolongation of the Rue de Rivoli from the Rue de Rohan, as far as the Place de l'Oratoire, has been opened to carriages.

It is commandant of the French squadron at the Antilles has received orders to assist the Caban Government in resisting the piratical adventures of General Lopez and his lawless band.

PORTUGAL.

We have advices from Portugal to the 6th instant. The alarm relative to the yellow fever at Oporto seems to have passed away, the disease which created the alarm, if it was the yellow fever, having assumed a mild character, as if unable to maintain its virulence in a European climate. The accounts, however, of the matter by the present mail are somewhat confused and uncertain.

The action entered by M. Ferrao, the late Minister of Finance, against the individual who charged him with having corrupt y received the public money some years since, has been tried, and resulted in M. Ferrao honourably acquitting himself in the estimation of the judges, to his character. It is expected that the Queen will immediately decline him to resume his office in the Cabinet.

Count Thomar, and his brother Jose da Silva Cabral, had united their influence to oppose the present Ministry. Accordingly, the Duke of Saldanha could need not be alarmed at anything they can do, their combined party being at a low ebb at the present time.

The Government is in great want of money; and all sorts of schemes are resorted to in order to raise it.

UNITED STATES.

The accounts this week from New York are to the 30th ult.

The excitement created throughout the Union by the news of the military execution of the Cuban patriots, Armas, Crittenden, and others, which we noticed last week, has resulted in a serious riot, on the 21st of August, at New Orleans, where the mob attacked the house of the Spanish Consul, who was compelled for safety to take refuge in a back garret. In the consul's office they destroyed papers, desks, furniture, and property of all kinds. They also broke down the sign, which they carried in triumph to a meeting in La Fayette-square. Minute-guns were fired from cannon taken from the arsenal, and coloured lanterns, as they are termed in the American journals. The Spanish paper *La Patria* came in for a large share of popular indignation, in consequence of some remarks it had ventured on the subject, and was prevented by the mob attacking the office of that paper, broke in the windows and doors, and threw the press, cases, type, and furniture into the street; in fact, they destroyed everything before them. The mob also came into collision on the part of the police. After demolishing the *Union* office, the rioters proceeded to the cigar store on the corner of St. Charles and Gravier streets, broke in the doors and windows, and destroyed a large stock of cigars and tobacco, which were very valuable. Nearly all the cigar shops kept by Spaniards were destroyed, as also three or four Spanish coffee-houses.

On the 28th the Spanish Consul resigned and left the Spanish residents of New Orleans under the protection of the English and French Consuls. The letter-book of the Spanish Consul was seized by the mob.

Many outrages were committed on Spanish citizens throughout the States.

At New York, and the northern and eastern cities, the most serious aspect hitherto to the Cuban affair is said to be the stopping and boarding the mail steamer *Falcon*.

The government had dispatched the United States frigate *Saranac* to Havannah, to inquire into the circumstance of the capture and execution of American citizens at that place, and also into the circum-tances under which the United States mail steamer *Falcon*, while on her way up the coast of Cuba from Chagres, was fired at three times by the Spanish steam boat *Habanero*, and was obliged to heave to, when she was boarded by the Spanish officers under pretence of searching for invaders. The Government (say the journals) continue to take the most stringent measures against the violation of the law by Americans in engaging in an expedition against Cuba.

The last accounts from Havannah are to the 18th August, at noon, by the *Empire City*, arrived at New Orleans—two days later than before. The accounts of the fate of Lopez and his troops are very contradictory nothing can be relied upon. One account states that Lopez had been victorious in all his engagements, and proceeded on though his intentions were not stated. Another rumours his defeat and capture. It is said that the *Empire City* brought the bodies of Colonel Crittenden and Captain Kerr, who were shot at Havannah, to New Orleans, but it was unknown.

BRAZIL.

Advices to August 14 from Rio de Janeiro, and to July 26 from Buenos Ayres, indicate the commencement of the hostilities so long pending between Brazil and Buenos Ayres. The intervening state of the Banda Oriental is, at once, both the cause and the battle-field of the contest between the two powers; the Monte-Videan Government, at the instigation of Rosas, the Dictator of Buenos Ayres, refusing to redress some grievances of Brazilian subjects, arising out of border feuds.

The details of the hostile movements are, that Count Caxias, with a Brazilian force of 15,000 men, had entered the Banda Oriental, and had either formed, or was about to form, a junction with Urquiza, who had also entered the Oriental territories, at the head of 4000 troops from Entrerios. The declared object of this junction is the expulsion of Oribe from the presidency of the state of Monte-Video, to accomplish that, Admiral Grenfell is directed to co-operate with the Brazilian naval force already in the Plate, and under his command, with the military operations of the army on land. Oribe, though suffering from severe indisposition, had placed himself at the head of the Uruguay soldiery, said not to exceed 6000 men. His principal hope is therefore on such assistance as Rosas may be able to send him; and any help from Buenos Ayres it will be Admiral Grenfell's duty to intercept and prevent. Rosas had, it is moreover reported, some difficulty in procuring any competent officer to undertake the command of his auxiliary force. Under these circumstances, the odds appear largely against Oribe being able to maintain his position. Great expectation is expressed that the hostilities will not be of any lengthened duration.

With the expulsion of Oribe, who has denied its reclamators all redress, the Brazilian Government will be satisfied. It has no ambitious views of conquest towards Monte Video, and has not entered into any engagements with Urquiza to aid him in the combination that has been entered into by him and the chiefs of the other provinces of the Argentine Confederation and Paraguay against Rosas for the purpose of his overthrow: and Admiral Grenfell has been specially instructed to respect in all his proceedings the commerce and property of neutrals in the Plate. The principal theatre at Rio was burnt down on the 9th ult.

WEST INDIES.

Accounts have been received this week from Jamaica to the 11th, and St. Thomas's to the 20th of August. The latter place, on the 18th, experienced the fall of a hurricane. It commenced at daylight, and from 9 A.M. to 2 P.M. it blew with terrific fury from N.E. to S.E. by E., doing great damage to the wharf under the town. One schooner was capsized at her anchors, two or three vessels went on shore, and others drove with both anchors down. The strength of the hurricane passed to the southward of St. Thomas. The next mail will bring, probably, disastrous accounts.

From Jamaica we learn that in Savannah-le-Mar, where there had been nearly 400 deaths from cholera, although the violence of the disease had greatly abated, there were still a few fresh cases.

Several cases of cholera had broken out at Newcastle among the troops. Whether any of them had proved fatal, was not known.

From the other islands there are only important item of intelligence is that of a frightful eruption of the long dormant volcano of the Pelée Mountain, in Martinique, which took place during the night of Tuesday, August 5th. Like the great and memorable eruption of the St. Vincent Soufrière in 1812, the phenomenon at Martinique is described as having been accompanied with "a noise similar to the approach of thunder, still nearer and nearer, with a vibration that affected the feelings and hearing." It appears, however, that, beyond a layer of grey ashy particles of calcined earth, and pyrilla, found in the morning upon the streets, houses, and shipping, as having been thrown forth by the volcano in the night, the people of St. Pierre were, up to our accounts, uninformed of the effects of the phenomenon.

ARRIVAL OF AN AMBASSADOR FROM PERSIA IN ENGLAND.

The *Esmeralda*, Captain Evans, arrived at Southampton on Saturday. Amongst the passengers was his Excellency Skeikh Khan, an ambassador from Persia to the Court of St. James's. As an event of importance from the court of Teheran is but rarely seen in this country, considerable interest is attached to the arrival of his Excellency. He is a fine handsome man, about forty years of age. He was dressed in the costly and picturesque costume worn by the highest ranks in Persia. The sleeves and collar of his coat were ornamented with gold embroidery; the clasp of his girdle was studded with diamonds, and a brilliant star was suspended on his breast. He wore the high conical cap of his country. He was accompanied by a dragoman and a servant. An extensive suite accompanied him from Persia to Turkey, nearly the whole of which he took leave of at Constantinople. On arriving at Southampton, the ambassador claimed the courtesies from the Government authorities usually accorded to the accredited representatives of foreign countries. Unfortunately, owing to the Custom-House authorities had received no notice of his anticipated arrival, nor any Treasury order to pass his baggage, consisting of about 250 packages, with nit examination. His Excellency stated that Sir Stratford Canning, at Constantinople, was aware of his mission to England, and had engaged to acquaint the English Government with it. Of course, all the courtesy which the authorities at Southampton could show the ambassador was consistent with their imperative duties was shown him, and telegraphic announcements to the Government departments in London were sent by them, stating the arrival of the ambassador, and soliciting immediate instructions as to his future movements. His Excellency left Southampton for London by an early train, apparently displeased with his reception in Southampton, and leaving at his baggage in possession of the Custom-House authorities. At the railway station in Southampton a native of Indian, the servants paid him every respect, and the superintendent of the station gave him a *coupé* for himself and secretary. After their departure, orders were received from the Government to allow him all the rights and privileges accorded to ambassadors of the highest rank.

His Excellency is staying at Crawley's Hotel, Albemarle-street, until a proper residence is selected for him for the Persian embassy. He is a Musulman, belonging to the great Mahomedan sect of Ali, and is remarkably strict in his observances. Every evening, while on board the *Esmeralda*, he prostrated himself and said prayers for about two hours. He had a number of ornaments in his possession, adorned with jewels and precious stones. One of these ornaments contained an emerald as large as a small plum. Most of these had been presented to him by the Shah of Persia to mark the favour and esteem in which he held him. Amongst the treasures he has brought to this country are some beautiful rugs and carpets. He has also presents for the Queen of England. Amongst his baggage were two immense trunks filled with jewels, which he would not suffer to be placed with his ordinary baggage. He was three months travelling from Persia to Southampton. He made a prolonged stay at Constantinople. About four years ago, it appears, an individual was sent from the Shah as attaché, in some degree, of the Persian nation, but for some cause or other he was not received. The political relations between this country and Persia have always been managed hitherto by ordinary diplomatic agents resident at the seat of government of commercial relations between England and Persia, on the part of the latter by a duly accredited ambassador high in his Sovereign's favour, can scarcely fail to be of advantage to this country.

KOSSUTH.—The United States steam frigate *Mississippi*, the largest steam frigate in the American navy, while on her way to Constantinople to receive Kossuth, the Hungarian chieftain, and convey him to America, ran ashore, on the night of the 13th inst., on the Island of St. Jacob's Castle, in Smyrna Bay, close to the light-house. The *Eurana*, British steamer, happened to be passing at the time, and with three other vessels attempted to tow her off, but were unable to do so. Fortunately, the tide was low at the time, and the *Mississippi* had run ashore, that some portion of her keel was literally high and dry. It is probable that she is not off yet; and if she has experienced rough weather she will have been in a perilous position, which he would not suffer to be placed with his ordinary baggage. RAILWAY ACCIDENT.—On Monday evening, about half-past six o'clock, a serious collision took place on the Great Northern Railway by which a large number of passengers were seriously injured, although no deaths are likely to be the result. An excursion train from Yorkshire was due at the Hornsey station about the above o'clock. Shortly before it arrived at Hornsey, however, it was found necessary to detach the engine from the train, so as to cause a stoppage of about ten minutes. When the train reached Hornsey, a luggage train, during which interval another train, coming in the same direction, dashed into it with such violence as to throw several carriages off the rails. A scene of great alarm and confusion followed, which, after subsided, and was instantly given to the passengers in the carriages overthrown, many of whom were severely injured. The following is given as the list of the parties injured:—The Rev. W. Snell, aged 56, of Fleet, near Holbeach, in Lincolnshire, concussion of the spine, and a consequent injury to the whole of his lower extremities; lying at the Railway Hotel, Hornsey. Mrs. Sarah Reynolds, of Tyler-street, Hitchin, Herts, contused leg and broken rib. Sarah Reynolds (her daughter), contused face. Henry Reynolds (her son), ancle injured, and contused leg and arm. Mr. Jackson, surgeon, of Lincs nshire; head injured, and otherwise hurt. Mr. Fulkes, of 9, Upper Southwick-terrace, Connaught square, Hyde-park; contused face; James Blow, stonemason, of Wisbeach; cap o knee injured. There are many others also, who suffered seriously in the train

FATAL RAILWAY CATASTROPHE.

A terrible event occurred on the Buckinghamshire Railway on Saturday evening, by which six persons lost their lives, and many were injured. Excursion trains left Oxford on Monday and Tuesday morning for London, with the understanding that passengers should return at stated times as late as Saturday. On that day the excursion train left the Euston station for Oxford. It consisted of fourteen carriages, drawn by one of Stephenson's six-wheel patent engines. Some of the carriages were unoccupied. There were, however, about 200 passengers in the train.

The train left London at a little before 5 o'clock, and approached the Bicester station at a rapid rate at about 7. On passing the "points," the engine became disconnected from the tender, went off the line to the right knocked down the further gate-post by the side of the turnpike road, and, having crossed the line on a level, and approached close to the porch of the station-master's house, which in all probability would have been forced down, but for one of the rails becoming imbedded round the wheels of the engine, and the perverse manner in which it became imbedded in the sand. The three carriages next to the tender, following the engine, went off the line to the left—knocked down the opposite gate-post to that razed by the engine, and went on with a tremendous crash. The scene was terrific. The cries of the suffering passengers and of the parties who were waiting at the station were appalling. One of the carriages went over on its side into the turnpike road, another was completely over, and the iron work crushed it in, and from the turf the bottom was torn off. One of the carriages went over near to the telegraph post, but fortunately did not injure it, and thus the instantaneous communication of the dreadful event was not prevented.

From the station being so near the town, the event was soon known, and the excitement became intense. Many of the inhabitants forthwith hastened to the spot, and assisted to the utmost of their ability. The last carriage which never became disconnected from the rest of the train, and the passengers in the other carriages escaped with bruises only. The event was fraught with terrible consequences, but unfortunately these also became great: telegraphic messages were also sent to the locomotive department at Wolverton for assistance; and in about an hour, Mr. Bedford, the inspector, arrived with a staff of assistants, and the necessary implements, and from the assistance afforded in righting the line, &c. The rails were torn up, and the line became impassable. Endeavours were forthwith used to assist the sufferers. Some had been thrown out from the other carriages, others were unable to do so, and some were, it was evident, dead. The work of extrication lasted till morning. Mr. MacConnell, the head of the locomotive department at Wolverton, and Mr. Cumming, from the Euston station, were at the scene as soon as possible. Mr. William Acton, surgeon, of 60, Upper Anne-street, London, and Mr. F. G. Wyatt, of 11, Queen-street, Oxford, a student of King's College, were passengers in the train. They immediately gave their advice, and on the spot rendered their services to the sufferers. The resident surgeons were also soon in attendance, as were also professional gentlemen from Oxford and Winslow. Alderman Browning, of Oxford, one of the directors of the Buckinghamshire Railway Company, was with other gentlemen, on the spot during the night. Every arrangement was made for the comfort of the sufferers. Several who were only slightly hurt proceeded to their destination; but the injuries made to ten of the passengers were of so serious, that they were forthwith removed to the King's Head, the Nag's Head, and other inns. The line was, ere daylight, made passable, but the engine and the carriage on the road had much damage inflicted. The engine was a new one—the plague was with all the crash and the sawing to release passengers, cut to pieces.

The following persons were killed on the spot:—Corporal Noon, No. 63, of the 7th company of Royal Sappers and Miners, the son of a builder at Oxford, on leave from Kensington barracks. Mrs. Sheldon and infant child, of Ashley-place, Oxford; Elizabeth Easley, a young woman of about 18, from 2, Draper's-place, New-road, London; Carrier, a lad of 14, son of the engine-driver who had charge of the engine at the time of the accident. The following were seriously injured:—James Luckett, a young man of about 24, who was on his way to Oxford (since dead); Davis, a Life Guardsman, and his daughter; Mr. and Mrs. Barrington, from London; Mrs. Bailey, from London; Mr. Bolton; Mr. Smith, on his way to 1, Clarendon-place, Oxford; a female of the name of Collis, from 83, Moorgate-street, London; and Mr. Daniel Sheldon, brother-in-law of Mrs. Sheldon who was killed.

It is necessary, in order to explain how the accident took place, to state that the Buckinghamshire Railway is a double line from Bletchley to Winslow. A little beyond the latter place the road diverges—one line to Buckingham, Brackley, and Banbury, and the other to Bicester and Oxford. To approach Bicester, there is only a single line of rail, but, about 200 yards before below the locking-office, there is a "siding" or "turn-out" on to the down platform; and into this "siding" all down-trains stopping at Bicester are turned by means of "points," which are always what is called "right" to the line of the siding. The points are kept in this position by mechanical means, consisting of heavy weights, and a through-train cannot pass the station upon the main line from Winslow to Oxford unless the policeman forces the points open and keeps them in the same position until the train has passed.

At the coroner's inquest, which has not yet been concluded, the engineering evidence adduced on Tuesday and Wednesday had special reference to the state of "the points."

William Carrier, the engine-driver, was questioned on the matter by the Coroner. He said: As I passed the points I saw the policeman take hold of the points' lever.

The Coroner: Supposing the handle of the points not to have been touched, what would have been the condition of the rails?—Witness: Right for me to go on to the siding on the left hand of the station. The natural way of the rails coming from Bletchley is to go on to the siding and into what is called the down station. In order to pass the points and go on to the main line, it is absolutely necessary that the police should be present and hold fast during the passing of the train. Our train went along the straight line, and not along the siding. Before we got to the points the policeman moved the handle. He must have moved it, for us to pass at all along the straight line. I saw no one but the policeman at the points.

The Coroner: Can you say distinctly that it was the same person as in the habit of attending the points?—Witness: I can.

Do you think that the whole of your engine got clear of the points along the straight line?—I can't say. Our engine is a six-wheeled engine. The wheels are coupled, and I think the middle wheels have flanges. The hind wheels have flanges. Don't know the distance between the front wheels and the driving wheels.

Coroner: After you found yourself on the straight line, what first drew your attention?—Witness: A sudden jerk as I stood on the foot-iron, when we got over the points. When I felt the jerk I had my hand at the reversing lever, intending to reverse the engine, but the jerk prevented me. Towards the last I then saw the large cross the road. I could tell by the jumping of the tender that it was more to the left of me than it should be. The moment afterwards the engine jumped off the rails to the right, and went towards the turnpike road. I felt myself in a very peculiar way, in some way as if I had been lifted in a boat by a wave. The engine passed one gate post and knocked another down, and then came to a dead stop within a few feet of the station master's house. I did not see that the rails till afterwards. I was not thrown from the engine; but the stoker fell from it just as it stopped, and he was slightly hurt in the back.

The Coroner: As an engine-driver, can you form any opinion of the cause of the deviation of the train?—The Witness: My firm belief is, that at the time I came to the points they were open, and the engine passed on to the straight line; that the points, from some cause which I cannot explain, were immediately afterwards closed, allowing the carriages off the straight line on to the siding. By so doing, I believe, at the speed at which we were coming, it would naturally draw the carriages off the siding towards the straight line. The force of the tender that it was more to the left of me than it should be. The moment afterwards the engine jumped off the rails to the right, and went towards the turnpike road. I felt myself in a very peculiar way, in some way as if I had been lifted in a boat by a wave. The engine passed one gate post and knocked another down, and then came to a dead stop within a few feet of the station master's house. I did not see that the rails till afterwards. I was not thrown from the engine; but the stoker fell from it just as it stopped, and he was slightly hurt in the back.

The Coroner: As an engine-driver, can you form any opinion of the cause of the deviation of the train?—The Witness: My firm belief is, that at the time I came to the points they were open, and the engine passed on to the straight line; that the points, from some cause which I cannot explain, were immediately afterwards closed, allowing the carriages off the straight line on to the siding. By so doing, I believe, at the speed at which we were coming, it would naturally draw the carriages off the siding towards the straight line. COMMENCEMENT OF THE NORWEGIAN RAILWAY AT CHRISTIANIA.

that contract I am called upon to act as arbitrator between the parties. This position involves great responsibilities, and would have been to me insufferable, had I not felt that both interests were actuated by the most honourable and liberal intentions. The Norwegian Government may rest assured that I am deeply sensible of the high trust which they have placed in my hands, and that it will be exercised, if occasion may require it, with the strictest impartiality. I may perhaps err in judgment, but my appreciation of the compliment they have thus paid me will always protect me from erring intentionally.

Mr. Frolich, a member of the corporation, then proposed "The health of the English capitalists, Messrs. Ricardo, Peto, and Brassey."

Mr. Peto replied in the following terms:—Gentlemen, in acknowledging the honour you have done my colleagues and myself, permit me to express my great regret, that one of them has been prevented the honour and pleasure of accepting your hospitality, by the necessity of his presence in Italy at the opening of a railway there, and that the other was compelled to remain in London by legislative engagements. The undertaking so auspiciously commenced to-day is fraught with benefit to your country and my own; it will in its completion place your fatherland a century in advance; it will develope your natural resources, and bring our nations into close contact; and though as capitalists we necessarily look to self-interest as the first motive in action, we are not insensible that there are other motives than mere money value. Our countries have a common sympathy; you have a Sovereign whom you affectionately regard, who not only commands your loyalty but reigns through your love; you have a constitutional country, whose interests are entwined round your sympathies, and whose advancement is the mainspring of all your actions. We, too, have a Queen who reigns paramount in our devotion and regard. We, too, have a country and constitution whose well-being is our constant care; and we cannot forget there are historical incidents which bind us closely; and the cordial reciprocity of to-day makes us feel that the sentiments of your hearts are in unity with mine, and that, were they audibly expressed, your response would be, "Were we not Norwegians, we would be Englishmen." But unless a weekly communication be established, by means of steam-vessels, with London, our proceeding of to-day is but one step in advance. It is a movement the value of which will be but half felt. I see before me, if properly followed up, the practicability of placing the centre of Norway as near to our capital as was the city of Edinburgh before railways and steam-vessels were known; and if you place Christiania and London within 60 hours of one another weekly, for every 10 visitors you now have you will then have a hundred. Your Sovereign and your Storthing must feel that a direct instead of a circuitous traffic with us is all-important to our common interest, and then let me assure you that your splendid mountain scenery, your lovely lakes, your stupendous water falls, will bring all my pleasure seeking countrymen, to whom the other parts of the continent are a beaten track, to your shores. And it is not, commercially and politically, an object worthy your effort, and one I feel assured you will prosecute with all your native energy and intentness of purpose? In carrying out our engagements as capitalists, the parties we employ are those we have known and acted with for years. They will not supplant your industry by the introduction of others, but attempt rather to direct your own industry in the execution of those works that to seek foreign aid. And this undertaking, which will so ultimately promote your increase of capital and comfort, will, in its transition to completion, aid your industrious workmen. I should here do injustice to my own feelings, were I not to refer to the open, frank, and candid manner in which the capitalists have been met by your Government, and especially by the chief of the department of the interior: he has not only given us his confidence, but commanded ours. We see, under his fostering care, not only the construction of new and splendid roads progressing in your country, but I found on my arrival a letter, showing how thoroughly all, even the minutest matters, have his judicious regard; he called my attention to the [illegible] and medical care of the workmen we employed, and accompanied this [illegible] with practical and excellent suggestions, that all I had to do was thankfully to adopt them all.

The healths of Mr. Bidder, Sir T. Acland, and the Consul-General (Mr. Crowe) were then given and responded to, and the meeting shortly afterwards broke up.

THE RESIDENCE OF THE BRITISH ENVOY, AT KHATMANDHAM, NIPAL.—(SEE PRECEDING PAGE.)

"TAM O' SHANTER," THE CRACK RACER OF BUENOS AYRES

THE BUENOS AYRES AMATEUR RACES.

(From a Correspondent.)

WELL knowing the readiness with which you give space to "sporting intelligence" from all parts of the world, when British residents, remembering their national sports, succeed in adapting them to the country they may happen to be located in, I send you an account of the Buenos Ayres Foreign Amateur Racing Society's Autumn Meeting, and some remarks on the horses, and the mode of breaking and racing practised by the natives of the country.

The horse of Buenos Ayres has little or no care taken of him, except in and about the city. He is bred wild, and grows wild. Attached to every *estancia* are from 500 to 6000 of the horse breed, which roam over the *campo*, attached only to certain districts where they were born by instinct. The mares are scarcely ever used, and are left in their natural state—wild and untouched, except when they were lassoed to be branded. Thousands of these animals live and die without again being approached by man. The system of breaking in the horse is, when horses are required for the use of the *estancia* or for sale in town, a *yeguada*, or troop, is driven into a *corral* (a pen or stock-yard, formed of strong stakes). Certain colts or horses, usually of four to five years old, are selected, when two or more *gauchos* enter, one of whom throws his lasso round the neck of a colt, and another casts his round the legs, and, with a sudden jerk, while he is bounding round the *corral*, the snorting and sometimes screaming animal is thrown to the ground, occasionally with a leg broken, and, as frequently as not, lamed in the shoulder. He is then secured with lassoes until a thong is made fast round his under jaw, and reins attached. A *recado* (the country saddle) is next put on his back; the *domador*, or horse-breaker, mounts, the lassoes are loosed, and the wild animal turned into the open *campo*, plunging in the most furious manner to rid himself of his rider falling in this, he usually breaks into a gallop, and, when we first, is brought back, unsaddled, and tied to a *palenque* (posts for the purpose), where he remains without food for twenty-four hours, and then again mounted; then tied up for another twenty-four hours, mounted again, and then collared to a tame mare, and turned out to feed. He is again brought up in a few days and undergoes the same course; after which he has to take his turn of work on the *estancia*. In a month or two the bit is substituted for the thong round the under jaw, and he is attached to the *tropilla* of tame horses. He is never cleaned; and, at most, if he has been rolling in the mud, sufficient space on his back is scraped with the back of the *gaucho's* long knife to admit the *recado*. When he has done his day's work, the *recado* is taken off, the bridle slipped, and he is free to join the *tropilla* to which he is attached, and feed in the open *campo* till next required. The animals themselves are small—on the average, under 14½ hands, though there are many which reach 15 hands to 15 hands 1 inch, and there are tolerably strong-boned animals among them. They are exceedingly enduring, frequently travelling thirty leagues per day without any other feeding than that they gather from the surface of the *campo*.

The proportion of fast horses is comparatively small, and they are usually found among those of about the average height, some of them being remarkably fleet in distances of from 300 to 800 yards, the general range of the country races. Those horses which run longer distances are fewer in number.

The style of racing among the natives is quite different from that of Europe. They never run more than two horses together, ride bare-backed, and rarely get away under ten to fifty false starts. They lay their horses close to each other, the legs of the riders touching, each rider seeking to gain some advantage. It is not considered a start till both riders strike their horses, which they will not do till each thinks his horse has put his "best leg foremost." This done, each rider endeavours to get his leg before the others, and so prevent his passing. They frequently kick each others horses with their heels in such a way as to impede the stride. Horses are occasionally brought to their knees by one of these kicks, which are given with extreme dexterity. The horses display extraordinary sagacity in their running, watching each other as closely as their respective riders do. They are trained to start on the instant, and pull up on the instant. They will then stand perfectly still, and, when turned, will walk back to the starting-post at the slowest possible pace; then again stand until turned and placed in contact, when they start with a bound, to be pulled up again within 50, 80, or 100 yards. I have known two whole days to be occupied with these *partidas* or false starts, before the horses have finally got away.

The usual feeding for horses in training for racing is about 20 lb. to 22 lb. of grain and bran *per diem*; say about 12 lb. to 14 lb. barley, 6 lb. of Indian corn bruised, and 2 lb to 2½ lb. bran, and a small quantity of green clover.

It was only about eighteen months ago that the foreign residents of this city turned their attention to the sport; and it was much feared by the proposers, that racing on English principles could not be carried out. An essay, however, was made with much success, so that a subscription was entered into, ground secured, and a permanent grand stand, calculated to accommodate about 1000 persons, half with seats, erected in a position commanding a complete view of the course. The course itself is a circular one of nearly a mile and a quarter. The circle extends to the brow of two hills, with a hollow crossing the course in the centre, so that the only level ground is the run home on the brow of one of the hills, a distance of about 300 to 350 yards. The other portion of the course is divided into two decided slopes, and two very stiff hills of about equal lengths, forming an exceedingly trying course. I state this feature especially, that a fair estimate of the speed of our horses may be made by taking the nature of the ground and the weights into consideration.

The meeting took place on the 26th of March, and was graced by the presence of his Excellency the Governor's popular daughter Donna Manuelita Rosas, and all the beauty of Buenos Ayres. The day was magnificently fine, and the sport highly satisfactory, commencing at half-past twelve o'clock with—

The PURSE, value 1500 dols., added to a handicap sweepstakes of 100 dols. each, h. ft.; gentlemen riders. Once round and a distance (one mile, 2 furlongs, 25 yards). Nine horses entered.—Souter Johnny (11 st. 4 lb.), 1. Blue Bell (10 st. 12 lb.), 2. Betting even on Souter against the field. The horses got away well together at a good pace, Souter, Pegasus, and Blue Bell contesting the lead, until rising the hill at the back of the course, when Souter took up the running. He was never after headed, and won cleverly. Time, 2 min. 35 sec.

The TRIAL STAKES, value 1600 dols., added to a sweepstakes of 100 dols., h. ft., for horses which never ran at any previous meeting of the society, was spiritedly won by Beeswing.

The AMATEUR STAKES of 100 dols. each, h. ft., with 1000 dols. added from the fund, was cleverly won by Chiefsfain.

The BUENOS AYRAN PLATE of 2000 dols., added to a sweepstakes of 100 dols. each, h. ft., open to all horses; gentlemen riders. Once round and a distance (1 m. 2 fur. 25 y.). 11 horses entered. Tam-o'-Shanter (12 st. 4 lb.), 1. Moonshine (10 st. 7 lb.), 2. This was the race of, perhaps, the greatest interest. The gallant old horse (some fifteen years old), Tam-o'-Shanter, the victor in five previous races on this course, and who has never yet met his match, was expected to be tackled this time by Moonshine (Ladron, a mere pony, was not even expected to make a show). It was well known that the old horse lost half his training time, owing to lameness. Both horses were tall, powerful-looking animals, and came to the scratch in good order. Betting closed at 4 and 5 to 1 on Tam. There was great excitement when the horses came on the ground; and when the starter's flag was lowered, and the three sprang away at a slashing pace, exactly abreast, it was excessive. At the turn, Moonshine showed half a length in advance, the old horse and the pony being together. In the hollow all three were together again, the pony being about a neck in advance at the commencement of the first hill; then all three together again. About half way round the pony began to give way, and the two cracks continued their course without the advantage of a head to either. Down the last hill, and up the last slope—and a stiff one it is—they went, and not a pin to choose. Moonshine then got a taste of the whip

PLEASURE-BOAT OF THE RAJAH OF JOHORE.—(SEE NEXT PAGE.)

and spur—the "old horse" one lift with the bridle, and the struggle was terminated; for Tam shot ahead, and won amid tremendous cheering. Time, 2 min 33 sec.

The ARTHUR HANDICAP SWEEPSTAKES of 100 dols. each, h. ft., with 2000 dols. added from the fund; gentlemen riders. Once round and a distance (1 mile, 2 furlongs, 25 yards). Six horses ran.—Tam-o'-Shanter (13st.), 1. Sonter Johnny (11 st. 4 lb.), 2. Though the old horse showed a little lame, the offers of his friends to back him found no response. Rover sprang off with the lead at a rattling pace, and was followed down the hill by Jack-o'-Lantern and Count Nugent, Sonter, the old horse, and the grey a little behind. Rising the first hill, Rover gave place to Jack-o'-Lantern, and the old horse came up with the Count, Sonter, and Rover; half way round he came up with Jack, and kept him company to part way up the last hill, when Jack was obliged to give place to the old horse. Sonter Johnny came up with Jack at the top of the hill, and a very pretty race ensued, though it was evident the old horse was being held hard. He was declared the winner by a length. Time, 2 min. 33 sec.

The ARGENTINE CUP, value 1200 dollars, added to a sweepstakes of 100 dollars each, half forfeit, was cleverly won by Rambler.

The HELTZE SKELTER STAKES, 50 dollars each, h. ft., with 500 dollars added from the fund, for beaten horses of the day, was won by Chloroform by a short head.

That a fair comparison of the speed and powers of the horses of this country with those of England may be made, the preceding severity of the course as well as the weight carried it, should be taken into account.

It will be observed from the foregoing, that Tam o'Shanter, carrying 12 st. 4 lb., ran this difficult course of 2 miles 2 furlongs 25 yards in 2m. 33s.; that within one hour and a half after this he again ran, carrying 13st., over the same distance, and won, without being pushed, in 2m. 33s. In what space of time might such a horse, carrying 8 st. 7 lb., the average weight in England for good horses, be calculated to run over such courses as those in England, the most difficult and severe of which is child's play to that run over here? Or in what space of time would an average horse, four or five years old, do the same distance, carrying 12 st. 4 lb., over the most difficult course in England? Such estimates will be found very useful to our infantine sporting world; as some calculation of the improvement to be made from a cross of these horses with the blood horse of England may be made. As yet there has been no such cross produced here: but now that foreigners have taken so decided a step forward in the turf "*à la Anglais*," breeding is likely to be looked to.

That your readers may form a correct idea of the crack racer of Buenos Ayres, we subjoin an accurate Portrait of Tam o'Shanter. He is a remarkably built horse; exceedingly high in the chine and hind-quarters, and correspondingly hollow in the back; very long fore-arm, and short cannon. The depth in the perpendicular from the fore-arm to the junction of neck and shoulder is the same as the length of the fore-leg. Hind-quarters powerful. He stands 14 hands 3 inches.

INDIAN PLEASURE-BOAT.

THE Engraving of the Rajah's Pleasure-Boat, engraved upon the preceding page, is interesting in illustration of yacht-building, which, since the performances of the *America*, have excited so much attention. This Indian boat is extremely fast; and, from the mode of sailing in use among the Malays (standing on the weather gunwale), can carry a very large press of canvass.

The term "wave principle," often used, is little understood except by those who have studied naval architecture as a science, although all the fastest ships, whether propelled by sails or steam, in this country, in America, and many other states—even in Brazil—have adopted the principle. According to the old principle, it was considered that vessels should be built with the water line nearly straight, the run of the vessel a fine line, and that there should never be a hollow line, except a little in the run of the ship; and that there should on no account be any hollow line in the bow, but that the water lines should be either straight or rather convex. Some years ago, at the request of the British Association for the Promotion of Science, Mr. Scott Russell, the present Secretary to the Royal Yacht commission of the Great Exhibition, and the late Dr. Robinson, of Edinburgh, undertook a series of experiments, with the view of ascertaining the form which would enable a vessel to move most quickly through the water. These experiments lasted for years, and established a set of facts which were reduced into new rules the majority of which were decidedly the reverse of the old rules of ship-building. They began by upsetting the old rule, that the length of a vessel should be four times its breadth, as they found that this greater the speed required, the greater should be the length, and that the vessel should be built merely of the breadth necessary to stow the requisite cargo. The second great improvement was, that the greatest width of the water line, instead of being *before* the middle, should be *abaft* the middle of the vessel—in fact, two-fifths from the stern, instead of two-fifths from the bow. The next great improvement was, substituting for broad, bluff, or cod's-head bow, hollow water-lines, called wave-lines, from their particular form; and, also, instead of the old fine run abaft and cutting it away, you might, with advantage, have a fuller line abaft, provided it was fine under the water. By these improvements the form of the old vessel was nearly reversed. All the fast steam-boats, accomplishing from 15 to 17 miles an hour, are built on this principle; and it will be found, too, that the main points have been attended to in the construction of the yacht *America*, as well as of the *Titania*.

CALENDAR FOR THE WEEK.

SUNDAY, September 14.—Thirteenth Sunday after Trinity.
MONDAY, 15.—Mr. Huskisson killed, 1830, on the Manchester and Liverpool Railway.
TUESDAY, 16.—George I. landed in England, 1714.
WEDNESDAY, 17.—Siege of Gibraltar ended, 1782.
THURSDAY, 18.—Laurence Sterne died, 1768.
FRIDAY, 19.—Battle of Poictiers, 1356.
SATURDAY, 20.—Battle of Newbury, 1643.

TIMES OF HIGH WATER AT LONDON BRIDGE,
FOR THE WEEK ENDING SEPT. 20, 1851.

Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday

NATIONAL ILLUSTRATED LIBRARY.—

BOSWELL'S LIFE of JOHNSON. Vol. III. Now ready, Vol. III. of this popular Series, illustrated with Portraits of Johnson's most celebrated contemporaries, and with topographical and other sketches of the principal scenes.

Vol. IV. will be ready with the MACHINE, on the 30th instant.

The following Volumes of the Series have already been published, price 2s. 6d. each, handsomely bound, and copiously illustrated with Wood Engravings by the most eminent artists:—

The MORMONS: a Contemporary History.
The BOOK of ENGLISH SONGS.
The ORBS of HEAVEN; or, the Planetary and Stellar Worlds. By D. O. MITCHELL, M.A.
Several other Volumes, original and selected, are in preparation, including Hue's Travels in China, Tartary, and Thibet; Mackay's Memoirs of Extraordinary Popular Delusions, &c.
London: Offices of the NATIONAL ILLUSTRATED LIBRARY, 198 and 227, Strand, and to be had of all Booksellers.

Characters by Mr. Oxberry, Miss Wells, Mr. Wilkinson, Miss Rainford, Mr. Cormick, Miss Rose, Mr. Vincent, Miss Woolgar, Mr. Hemmings, Miss Lee, Mr. Hemmings, Miss Lee, Mr. Hemmings, Miss Lee

trian Government is in the market, it would appear, for a new loan. We put it to our readers, whether there is much security in a Government that cannot trust its own people to express their opinions, or meet in public, and that only maintains tranquillity by means of a stupendous army, the expense of which is enough in a short time to drain the resources of a state a dozen times as powerful?

COURT AND HAUT TON.

THE COURT AT BALMORAL.

Her Majesty and the Prince Consort are enjoying their residence among the mountains of Aberdeenshire in the true spirit of the highland sportsman. Her Majesty takes daily sallies in the neighbourhood of Balmoral, frequently extending her drive throughout the most beautiful districts for several miles. The proximity of Abercaldie, the residence of her Royal Highness the Duchess of Kent, to Balmoral renders the Royal residence particularly agreeable to her Majesty, who makes frequent visits to her illustrious parent.

The notes of the week are thus simply recorded by the *Court Newsman*:—

On Thursday, the 4th inst., his Royal Highness went out deer-stalking. Her Majesty and the Princess Royal rode with his Royal Highness to the forest. In the afternoon the Queen and the Prince of Wales visited the Duchess of Kent at Abergeldie.

On Friday, the 5th, her Majesty, the Princess Royal, and the Princess Alice again went to Abergeldie. The Prince Consort went out deer-stalking in the morning.

On Saturday, the 6th, the woods in the neighbourhood of Balmoral were driven for deer. In the afternoon, her Majesty and his Royal Highness Prince Albert, accompanied by the Princess Royal and the Princess Alice, drove to Birkhall, and afterwards visited the Duchess of Kent at Abergeldie.

On Sunday, her Majesty and his Royal Highness Prince Albert attended Divine service in the parish church of Crathie. The service was performed by the Rev. Dr. Macfarlane, Principal of Glasgow University, and one of her Majesty's chaplains in Scotland. Mr. Henry Hallam and Principal Macfarlane dined with her Majesty and the Prince Consort in the evening.

On Monday, her Majesty drove to the Pass of Ballater, accompanied by the Princess Royal and the Princess Alice. His Royal Highness Prince Albert enjoyed the sport of deer-stalking during the morning.

On Tuesday her Majesty drove to Invercauld in an open carriage. The Queen was attended by the Marchioness of Douro and the Hon. Miss Byng. His Royal Highness Prince Albert went out deer-stalking.

The Marchioness of Douro has relieved the Countess of Desart as Lady in Waiting on her Majesty.

Lord John Russell has left Balmoral for the south. The noble Lord visited the Earl of Minto, the Right Hon. Fox Maule and Hickleton Hall, the seat of the Chancellor of the Exchequer, *en route*, arriving at Pembroke Lodge on Thursday. We believe that the Earl of Carlisle will succeed the Premier as the Secretary of State in attendance upon her Majesty.

APPROACHING MARRIAGE IN HIGH LIFE.—We understand that a matrimonial alliance is arranged, and will very shortly take place, between the Marquis of Chandos, M.P., only son of the Duke of Buckingham and Chandos, and Miss Harvey, only daughter of Robert Harvey, Esq., of Langley Park. The ceremony, we believe, will take place in Scotland.

The Lord-Lieutenant of Ireland and the Countess of Clarendon, who have lately lost their infant daughter, are suffering deep anxiety in consequence of the protracted illness of their youngest son, who is in a state of great debility.

We understand that Lord and Lady Edward Fitzalan Howard are about to proceed on a Continental tour. Her Ladyship has lately been suffering from indisposition.

CHURCH, UNIVERSITIES, &c.

PREFERMENTS AND APPOINTMENTS.—The following appointments and preferments have been recently made:—*Dearmer's Herald*: The Rev. Michael Lloyd Agabon to Emly; the Rev. J. B. B. Clarke to Wellington district, Somerset; the Rev. R. C. L. Guyon to Bruton district, Somerset; the Rev. F. Berkeley Portman to Taunton. *Rectors*: The Rev. L. Stitreff Dudman to Pitney, Somerset; the Rev. J. L. Hilliard to Cowley, Middlesex; the Rev. Edward Holland to Cumerton, Somerset; the Rev. A. Nugee to Witley, with the vicarage of Wynersing, Hants, the Rev. F. Marmaduke Rowden to Stanton Fitzwarren, Wilts; the Rev. J. F. Wyvill to Barnardiston, Suffolk; the Rev. Thomas Linkham to Holy Trinity, with St. Mary Guildford, Surrey; the Rev. Robert Eden to Antingham, with North Walsham, Norfolk; the Rev. Richard Perrian to Sidbury, Devon; the Rev. Thomas Knowles to Ruston, Lincoln. *Vicarages*: The Rev. J. Fawcett to Knaresborough, Yorkshire; the Rev. J. S. Vaughan to Stockland, Bristol; the Rev. Sydney East to Northover, Somerset; the Rev. Richard Wickham to Lyme Regis.

THE BISHOP OF GLOUCESTER AND BRISTOL.—From the latest accounts received from the Continent, it appears that the health of the Lord Bishop of Gloucester and Bristol has much improved, and his Lordship hopes to be able to commence the visitation of the diocese in the early part of the present month. He has been joined by Mrs. Monk and the members of his family.

DIOCESAN SYNODS.—The Committee of the Consultative Meeting at Derby, which was appointed on the 8th day of October, have issued a circular, reminding the clergy and laity interested in the subject of Diocesan Synods, that they are now preparing the business of that meeting, and will be glad to receive communications suggestive of topics for discussion.

TESTIMONIALS.—The following clergymen have recently received testimonials of esteem and affection:—The Right Rev. Robert Eden, Bishop of Moray and Ross, from his late parishioners at Leigh, Essex; the Rev. Robert Ford, curate of Leigh, Essex; the Rev. Thomas Mayor, from the parishioners; the Rev. David Dale Stewart, late of St. Bride, Liverpool, from the congregation; the Rev. T. F. Sutton, on retiring from St. Jude's, Manchester, from the congregation; the Rev. William Mercer, of St. John's Maritime Church, Dover, from a portion of his juvenile congregation; the Rev. Neville Jones, perpetual curate of St. George's, Bolton, Lancashire, from the teachers and scholars of the Sunday-schools; the Rev. J. Williams, incumbent of Trinity Church, Yeovil, from members of his congregation; the Rev. A. B. Russell, late curate of St. Cuthbert's, Wells, from the congregation, on his departure.

PREACHING IN THE OPEN AIR.—The Rev. J. K. Marsh, minister of Brimington, has lately commenced out-of-door preaching, on Brimington-common and other places in his parish. The same practice is also observed in different parts of the county, by some of the clergy, who adopt it as the best and indeed the only means of addressing such of the parishioners as absent themselves from church on the Lord's-day. The neglect of public worship is, we believe, very general in the mining districts, whilst open-air preaching, or the ecclesiastical description of the Sabbath becomes fearfully prevalent amongst the working classes.—*Derbyshire Courier*

HER MAJESTY has intimated her willingness to act as patron of the Colonial Church and School Society, an institution formed expressly for sending to the colonies clergymen and other religious teachers stedfastly attached to the doctrines of the Reformation. The Archbishops of Canterbury and York have also intimated their adherence to the society.

CHESTER AND HOLYHEAD RAILWAY.—On Thursday, the half-yearly meeting of this company was held at the Euston station; S. M. PETO, Esq., in the chair; when a dividend of 3s. 1d. was declared on the Preference shares, leaving an arrear of interest upon them amounting to £18,000. The chairman, however, expressed his full conviction that by the end of the year their revenue would be amply sufficient to meet the whole of the debenture and preference interest, and have something in hand.

STEAM COMMUNICATION WITH THE WEST COAST OF AFRICA.—The Admiralty have advertised for tenders for a monthly mail line of screw-steamers to and from the west coast of Africa. The ports to be touched at are Goree, Bathurst, Sierra Leone, Monrovia (Liberia), Cape Coast Castle, Accra, Whydah Badagry, Lagos, Bonny, Old Calabar, Cameroons, and Fernando Po. The whole coast of the slave coast will thus be included; and it is understood that the object of the line, which, in the first instance, of course will carry scarcely any passengers or letters, is to promote the extinction of that traffic, not only by cultivating intercourse with the natives, but by making it the interest of the slave-dealers themselves to convey from point to point. The vessels are to be of an average speed of eight knots, and the contract is to be for five years. The Cape of Good Hope steamers sail at the same time; but the proposed line will obviate that necessity, which has been found a serious hindrance, and the route of those vessels will therefore be altered, so that, instead of visiting Sierra Leone, they will call at Ascension on their way to and St. Helena on their homeward-bound passage. The amount of cargo likely to be supplied by the various points on the new African route may be expected steadily to increase, and at last to become important. Ivory, palm oil, camwood, gold dust, &c., would at first be the chief articles; but Liberia has already forwarded specimens of cotton of good quality, which may eventually be produced to a large extent; while at the same time the accounts of the increasing trade of the people of that republic with the natives of the interior promises a steady augmentation in the imports of our manufactures.

The two convicts who escaped last week from the convict establishment in Dartmoor, have been apprehended at Zeal, on the northern boundary of the moor.

A most destructive fire had taken place at Concord, N. H., in the United States, on the night of the 23th ult. Three newspaper offices were entirely consumed. The total loss was estimated at 125,000 dollars, mostly insured.

Mr James Hudson, now her Majesty's Minister at Rio de Janeiro, is appointed her Majesty's Minister at Florence. Mr. Henry Southern, now Minister at Buenos Ayres, is to succeed Mr. Hudson at Rio de Janeiro. Captain the Hon. Robert Gore, R.N., now Chargé d'Affaires at Monte Video, is appointed in the same capacity at Buenos Ayres. The Hon Frederick Bruce, now Chargé d'Affaires in the Republic of Bolivia, is to succeed Captain Gore at Monte Video.

It has been decided by the Government authorities, that all preserved ginger from Hong-Kong be charged with the high rate of duty on importation into this country.

THE ILLUSTRATED LONDON NEWS.

COUNTRY NEWS.

HER MAJESTY'S VISIT TO LIVERPOOL.—At a special meeting of the Liverpool town council, held on Tuesday, the Mayor stated that a communication had been received from Colonel Phipps with regard to objects which her Majesty [illegible] during her visit to Liverpool, on the 14th and 15th of October next. Her Majesty proposes, in the first instance, to go to the landing-stage at ten o'clock, and to proceed on the river in her own boat, the *Fairy*, for the purpose of inspecting the docks. She hopes that an hour and a half may be considered sufficient for that object. She will then return to the landing-stage, and proceed to the inspection of some of the buildings named in the programme, without leaving her carriage. She will then return to the town-hall to receive an address, and to partake of a strictly private luncheon. Her Majesty will afterwards proceed on her route to Worsley by the railway. At the request of the Mayor's statement there were loud cries of "Hear, hear," and "No St. George's Hall." His worship added, that he trusted the council would nominate such committee as might be necessary to carry out the arrangements for the proper reception of her Majesty.

IMPROVEMENTS TO THE APPROACHES OF WINDSOR CASTLE.—The long-talked of extensive improvements in the approaches to Windsor Castle have been commenced this last week, by order of her Majesty's Commissioners of Woods and Forests, after the plans and under the direction of Mr. Page, the Government architect. The massive iron gate, stone buttresses, and palisades connected with the lodge at the Long Walk entrance to the Great Park-street, have been removed, and the lodges at the entrance to the Long Walk taken down. Two magnificent gates are to be erected here, the one leading to the Castle for the exclusive use of her Majesty and the Royal family, and the other for the use of the public in passing and re-passing to and from the Long Walk. The design of these gates has been completed some time since by Mr. Page, and is very handsome. The ornaments include the arms of every British monarch, from the time of the Norman conquest. The gates are to be constructed on a new self-acting principle, and by which they will be made to open and close as the carriages approach and depart, without the assistance of the gate-keeper. The high road to Old Windsor by Frogmore has been stopped, the Hops Inn and all the buildings in that neighbourhood taken down, and henceforth the road will be used only as a carriage drive for the Queen and the Royal Highness the Duchess of Kent. The old wall enclosing the Home-park by Frying-pan-walk will be immediately pulled down, and several vistas have already been made by the felling of trees in the avenue leading in the direction of the keepers' lodge by the old Waterloo-gates. The park paling on the Frogmore side of the Long Walk will be taken away and replaced by an invisible fence. The alteration will add much to the beauty of this matchless avenue. The Royal property deer-skirting Frogmore Lodge, and known as Shaw Farm, consisting of about 500 acres of arable and meadow land, will shortly be given up by its present tenant, Mr. Charles Steward Cantrell, to Prince Albert, for the consequence has been a rapid rise in the price of provisions. Flour, which purpose of being converted into a model farm by his Royal Highness, and the old dairy at Frogmore will be removed thither. Several sales have recently taken place of the materials of houses purchased by the Crown on the Castle side of Thames-street, for the purpose of their being pulled down; and the few which now remain between the hundred steps and Castle-street will be sold and pulled down in the course of a fortnight. Orders have been given by her Majesty and his Royal Highness Prince Albert, that all the improvements to be connected with the improvements of Windsor shall be carried out without further delay, and the Royal borough, which for so many years has displayed the aspect of desolation, will, in a short time, assume its wonted cheerful and pretty appearance.

SCENE IN A BAPTIST CHAPEL.—At the Cambridgeshire Petty Sessions, on Saturday last, a man named Dowman was charged with disturbing and disquieting the congregation of a Baptist chapel in the village of Coton (about three miles from Cambridge). It would seem that the congregation of the chapel are not celebrated for their erudition, and in a pub le-house on the East-road, Cambridge, a conversation arose over some potations as to how easily they could be duped; and eventually it was agreed between some parties, whose names were freely stated, that an imposit on should be attempted, and several wagers were laid upon the result. It was arranged that Dowman, who is a travelling hawker from Colchester, and who was considered the best hand at recitation, should personate a Baptist minister, and he, being dressed for the part, and having got various specimens to prevent recognition, proceeded to Coton with his confederates, on the 16th May, introduced himself to the deacon, and presented a letter (with a fictitious signature), saying that he was engaged in preaching the Gospel in Lincolnshire, and was on his way homewards; the appointed preacher made way for him, and he ascended the pulpit, gave out a hymn, engaged in prayer, and then, taking his text (Ezekiel, xl. 33), proceeded to read from Cowley, Middlesex, instead of Coton, as he ought to be Baxter's Saint's Rest." The congregation, being used to extempore discourses, evinced symptoms of disapprobation, and at last the mock preacher fairly broke down, declaring the audience to consist of a "parcel of fools," and on addressing the large congregations. Mr. Bradfield, the regular preacher, then rose, and cautioned his congregation not to part with any money, as he knew nothing of the party who had addressed them. Information was given to the police, and Dowman, the latter "impostor" resounded on all sides, and Dowman had to make his escape to a fly, in which his confederates were waiting for him. Dowman was met in Cambridge next day by Mr. Bradfield, and, a little violence ensuing, the process was eventually issued. The magistrates sentenced Dowman (who let judgment go by default) to pay a fine of £10 and the costs, which was made up among the confederates, so that planned this ill-fated fraud.

RETURN TICKETS.—A man was travelled from Bristol to Swindon on the Great Western Railway, by means of a return ticket which he had purchased at a low price from an exonarionist not returning to London, and on [illegible]m, a few days ago, the magistrates declared that he had rendered himself liable to three months' imprisonment; but, as it was the first offence of the kind brought before the bench, they had inflicted a mild punishment, in the hope that it would prevent its re-occurrence as a warning.

FATAL COLLIERY ACCIDENT.—Aberdare adds another to the fearful list of colliery accidents, of late so numerous in the mineral districts, and by which valuable lives have been lost to a melancholy extent. On Thursday week (last week) fourteen colliers were in the act of descending Mr. Naxon's plance pit, called the Werva, in the vicinity of Cwm Bach, when the chain attached to the carriage broke, and they were all hurled to the bottom of the pit, a depth of 180 feet. They were all subsequently brought up dead, and dreadfully mangled.

ROBBERIES IN LEEDS.—On Monday evening last, Mr. Alderman Hesper, of Leeds, was robbed of his gold watch and chain by three men, who attacked him near his own house, at Wortley. One of the Alderman's assailants held him up against a wall and half strangled him, whilst the other two divested him of his watch and appendages. Several other robberies of a similar character have taken place within the last few days. On Friday evening week, Mr. Johnson, a clerk in the Great Northern Railway Company's office, was attacked in a similar manner while walking in Queen's-place, a public thoroughfare in Leeds, and robbed of a silver watch and gold chain. On the Saturday night, a young man, named John Mitchel, was attacked in the Turk's Head-yard, Briggate, and robbed of about £4 in gold and silver. These frequent and daring street robberies have put the police quite on the qui vive; and if they are equal to their duty, before long some of these audacious street robbers will be apprehended.

ANOTHER FATAL RAILWAY ACCIDENT.—An accident, attended with loss of life, occurred on Wednesday morning, on the Midland line of railway. About seven o'clock a luggage train for Mansfield, which should have started at half-past six o'clock, left the Nottingham Railway station, and when the seven o'clock passenger train for Derby to be delayed a short time, until it was supposed there would be a clear course. On arriving at the point where the Mansfield branch diverges from the main line, the engine driver of the latter perceived that some empty carriages which stood in a slip line, preparatory to joining them to the train and carrying them forward to Mansfield. The guard thought he should be able to get away before there could be any danger, but the passenger train came along. There had been sufficient time for the goods train to get on to the branch line; and, as no signal to the contrary had been given, concluding that a collision was inevitable, he jumped from the engine, and immediately afterwards the train ran into the waggons. The driver escaped unhurt; but the stoker, a smart young man, was found near the tender on the ground in a state of insensibility, with his thigh, chest-bone, and ribs broken. He was immediately conveyed to the Nottingham Hospital, and taken to the General Hospital, where he died in an hour and a quarter afterwards. None of the passengers were injured.

DEATH BY ASPHYXIA A few days since, two men, named Red and Turner, plumbers, were sent to cut off a portion of a pipe connected with the pump at the King's Arms Inn, St. Sidwell's, Exeter. To do this, they had to descend a well 60 feet deep. Red let himself down first, and, not returning as soon as was expected, Turner went down after him; he, also, did not return; and then a third man was let down with a rope round his waist. The experiment had been nearly fatal, for the well, which had been recently opened, was filled with carbonic acid gas, and this poor fellow, on his return to the surface, was found to have been nearly suffocated. Of the other two there was no hope, and when the bodies were recovered, at the end of three-quarters of an hour, they were found to be quite dead.

GREAT SKIFF MATCH FOR £100 ASIDE, ON THE TYNE.—[illegible] match, which had to test the capabilities of the two best men on the Tyne, Henry Clasper and Candlish, came off on Tuesday afternoon, and proved a most exciting and considerable interest. The men were started at four o'clock, top high water, and Clasper soon drew ahead. On approaching Shot Tower, ab ut half way to the goal, Clasper was a good skiff's length ahead; the latter gave that spot, Candlish having the north side of the river, Clasper close in upon him, and ran him ashore against the quay. Clasper pulled away, and was shortly followed by Candlish, who came in two skiffs' length astern. The referee has declared the race in favour of Candlish, a result which seemed to disappoint everybody. The betting seemed about even on the course.

There is a gentleman farmer residing at Mark, in this county, named Peters, who is in his 103d year. *Bath Chronicle.*

A terrific tornado recently passed over a part of Massachusetts, U. S., doing fearful damage. It is estimated that the tornado travelled about 50 miles an hour. In one place, in West Cambridge, stones weighing 1000 lb. are said to have been carried some distance by the storm.

DISCOVERY OF GOLD IN AUSTRALIA.

The following is from the *Sydney Morning Herald* of Tuesday, May 20, and quoted by that paper from the *Bathurst Free Press*, of Saturday, the 17th:—

"The discovery of the fact by Mr. Hargreaves, that the country, from the mountain ranges to an indefinite extent in the interior, is one immense gold [illegible] has produced a [illegible] town of Bathurst and the surrounding districts. For several days after our last publication the business of the town was entirely paralysed. A complete mental madness appears to have seized almost every [illegible] the community, and, as a natural consequence, there has been a universal rush to the diggings. Any attempt to describe the thunderless scenes—grave, gay, and ludicrous which have arisen out of this state of things, would require the graphic pen of a Dickens, and would exceed any limit which could be assigned to it in a newspaper. Groups of people were to be seen early on Monday morning at every corner of the streets, eagerly discussing the solemn conclave, debating both possibilities and impossibilities, and eager to pounce upon any human being who was likely to give any information about the diggings. People of all trades, callings, and pursuits, were quickly transformed into miners, and many a hand, which had been trained to gild gloves, or accustomed to wield nothing heavier than the grey goosequill, became nervous to clutch the pick and crowbar, or "rock the cradle" at our infant mines. The breadth of the town could not turn off the picks fast enough, and the manufacture of cradles was the second briskest business of the place. A few left on Monday equipped for the diggings, but on Tuesday, Wednesday, and Thursday, the roads to Summer-hill Creek became literally alive with newmade miners from every quarter, some armed with picks, others shouldering crowbars or shovels, and not a few seen going around with wash-hand basins, tin pots, and colanders—goods and agricultural implements of every variety either hung from the saddle-bow or dangled about the persons of the pilgrims to Ophir. Now and then a respectable tradesman, who had just left his bench or counter, would leave in sight, with a huge something in front of his horse which he called a cradle, and with which he was about to rock himself into fortune. Scores have rushed from their homes, provided with a blanket, a tin pannikin, and a pick or grubbing-hoe, full of hope that a day or two's labour would fill their pockets with the precious metal; and we have heard of a great number who have started without any provision but a blanket and some flour mixed up with water. Such is the intensity of the excitement that people appear almost regardless of their present comfort, and think of nothing but gold. Of course all this must end in disappointment. The wet weather of the last two days has put a check, with the damp ground for a bed, and the teeming clouds for a canopy, will do much towards damping the enthusiasm of numbers. We have the authority of an experienced man in stating, that, from the imperfect and unsuitable implements used by all who have left for the diggings, coupled with other miserable provision in other respects, success is impossible; that the labour necessary to success is extremely severe, and he ventures, as his opinion, that not more than 3 per cent. will become permanent miners. One of the consequences has been a rapid rise in the price of provisions. Flour, which ranged from 25s. to 28s. per 100 lb., has been sold for 40s.; tea, sugar, and almost every eatable commodity have advanced in equal proportion. A large amount of the gold in this district is in the hands of a few speculators, who will maintain their hold in the hope of a good harvest. But for the very extensive supplies now on their way from Sydney, four would soon be at a famine tensive supplies now on their way from Sydney, four would soon be at a famine pass. Already a rush has taken place from below, as may be reasonably expected. It is to be hoped that there are capitalists enough to adventure in one of the safest speculations of the times—the purchase of flour for the supply of the district.

"What assisted very materially to fan the excitement into a flame was the arrival of a son of Mr. Neale, the brewer, with a piece of pure metal, weighing 11 ounces, which was purchased by Mr. Austin for £30, who started to Sydney by the following day's mail, with the gold and the news. Since that, an old man named Hardwick, who resides in Bathurst, returning in all from two to three days, and has been seen by many with his prize. Mr. Kennedy, the manager of the Bathurst branch of the Union Bank of Australia, visited the diggings on Saturday last, in company with Messrs. Hawkins and Green, and each of these gentlemen picked up a small piece of the pure metal; and a few handfuls of the loose earth from the bed of the creek, which were brought home by Mr. Kennedy, from motives of curiosity, have been since assayed by Mr. Smith, of Sydney, and a grain of gold extracted therefrom of the size of a small pea. Besides these, we have not heard of any particular instances of success.

"On Wednesday morning last, Mr. Hargreaves, accompanied by Mr. Stutchbury, the Government geologist, went to the diggings, and with his own hands washed a tub of earth in his presence, from which 21 grains of fine gold were produced. He afterwards washed several baskets of earth, and produced gold therefrom. Mr. Stutchbury has expressed his satisfaction, and immediately furnished him with credentials, which have since been forwarded to Government. The fact of the existence of gold is therefore clearly established; and we have no doubt that the Government will, in addition to the fact of Mr. Hargreaves commissioner, over the gold regions, in addition to the fact of Mr. Hargreaves being the discoverer, his practical acquaintance with mining, points him out as the most suitable and worthy person for the appointment.

"We have very much more to say, but not space to say it in.

"A Mr. Rudge, an experienced California gold digger, is now at work in the diggings. There are also several magistrates plying their picks and cradles most laboriously, but we have not heard with what success. In fact, many more are practising the art than could find position in the course of time. Those who have not already departed are making preparations. Servants of every description are leaving their various employments, and the consequences of such a devastating calamity as the simultaneous desertion

GOLD IN AUSTRALIA.

ROAD OVER THE BLUE MOUNTAINS TO THE BATHURST DISTRICT.

an extract of a letter from an extensive landholder in the Bathurst district:—"We are all in the greatest excitement here, some from joy, some from despair, anticipating famine, disease, and death. I am glad to hear the military are coming up; we shall sadly want them. Went to the diggings, and in three hours got one ounce of gold in one bright lump. Carriage is so high I am afraid we shall not be able to get up supplies."

"Another letter received by a Sydney merchant states that rock salt has been discovered in the search for gold. A regular company is at work under the auspices of a member of council, whose daily operations average in their results a full ounce per man.

"The *Maitland Mercury* states that gold has been discovered in a tract of country situate between Summerhill on the south, and Dubbo on the north, and known as the Wellington district. The more authentic accounts warrant us in believing that one large piece of nine ounces, and two or three small pieces of several ounces weight, and some pounds of grain and dust, have already been found by the parties engaged in digging there.

"Three apprentices who ran away from Bathurst, returned in a few days with 17 ounces of gold, which sold for £61.

"Considerable quantities of gold and gold dust were waiting at Bathurst when the *Thomas Arbuthnot* left Sydney, until an escort should convoy it to the latter place.

"The above-mentioned ship has a piece of gold on board weighing 4½ lb.; it is from Bathurst, and is intended to be placed in the Great Exhibition."

THE ILLUSTRATIONS.

The spot from which the first Sketch is taken is about sixty miles from Sydney, on the road passing over from the Blue Mountains to the Bathurst district. These mountains rise somewhat abruptly from the Emu Plains, near the little township of Penrith. Ascending Lapstone Hill, and passing the Pilgrim's Inn, the traveller, after a twenty miles' ride over a road in most parts excellent, arrives at the little inn known as the Weather-board Hut. Up to this point the scenery is by no means interesting; but here he should leave his horse and the main road, and, passing the group of buildings on the left, used as a police station, find his way by the little stream which leads through the valley. The first mile of his ramble gives but faint promise of the treat in store for the traveller; but now the valley turns suddenly to the right; its sides become precipitous; huge walls of mighty rocks rise, tier after tier, in the distance; the stream has lost its still and peaceful character, and now, leaping from stone to stone, it conducts to the brink of a fearful chasm, some thousand feet in depth, into which it plunges, and becomes a mere filmy vapour. This wild spot is a portion of Jamieson's Valley; the peculiar and striking character of which is seen to advantage at the spot from which the second View is taken, about eight miles to the westward of the Weather-board Hut. Passing Mount York and Mount Victoria, over a road which will ever be a monument to the skill and perseverance of Sir Thomas Mitchell, Surveyor-General of New South Wales, the highest point of the Blue Mountains is gained, and the descent into the plains of Bathurst commences. There, rocks, forests, and mountain streams form combinations of the grandest scenery, ever exciting the admiration of the lover of the picturesque; but at this time putting forth fresh claims of attraction to the world—for this is the gold district of Australia.

PORTRAITS OF CAPTAIN SIR JOHN FRANKLIN, AND HIS CREW. —(SEE NEXT PAGE.)

ARCTIC SEARCHING EXPEDITION.

THE following letter from Captain Parker, of the *Truelove* whale ship, giving an account of Captain Austin's expedition up to the 13th of September, 1850, has been brought by Captain Orr, of the *Tyne*, of Berwick-upon-Tweed, which ship arrived at that port on the 6th inst., from Davis's Straits.

From this letter it would appear that the searching expeditions were about to enter into winter quarters on the southern shore of Cornwallis Island, in Barrow's Straits; and Captain Parker, of the *Truelove*, transmits a letter from Mr. Kane, surgeon of the United States exhibition, which will be read with the deepest interest by all concerned in Sir John Franklin's expedition.

The traces of Sir John Franklin's expedition, which had been already reported by Captain Forsyth as having been discovered by Captain Ommaney and Lieutenant Bertie Cator, had been further followed up by Capt. Ommaney, Capt. Penny and Captain De Haven of the United States expedition, placing beyond a doubt the safety of Sir John Franklin's ships up to this point, which was their first winter quarters, and during their sojourn at which there is not the slightest ground for supposing that any disaster of any description had occurred beyond the ordinary casualties of life among such a number, three men having died of the two ships' companies up to April, 1846, about which period they would be preparing to push forward on the main object of the expedition.

The persons whose graves are here reported formed part of the expedition. Mr. M'Donald is Assistant-Surgeon of the *Terror*.

"Davis's Straits, July 24, 1851.

"My Lords,—May it please your Lordships to receive at my hands the enclosed testimony, received on the 12th of July, of the American searching vessels, of the successful issue of their voyage in search of Sir John Franklin.

"On the 13th of September, 1850, they left all the searching vessels at Cape Martyrs, Cornwallis Island, they not being able to pursue any further direction from that date.

"A harbour, called the Assistant Harbour, discovered by Captain Ommanney, three miles south of Cape Martyrs, was the place in selection by them to winter in. The bay ice was forming very strong at that time, yet the *Advance* and *Rescue* were determined to proceed onwards; but unfortunately, however, a gale sprung up and drove them up Wellington Channel 80 miles, and after wards they were frozen in.

"I have not yet been enabled to get further northwards than the Devil's Thumb; and the time being limited for my sojourn in that quarter, I cannot give you any more particulars excepting that the two American vessels and the *Prince Albert* were left by us near the Duck Islands, the wind being south-west, and blowing strong at the time.

"The American schooners have left some dispatches for the Admiralty at Shetly, which in due time I hope will be received.

"At this date I am off Stolsinberg. The ice in my voyage northwards seemed to be very light, but I could not get through it in time. The American Captain, De Haven, told me that the winter was very mild, and that he don't give no further particulars respecting Sir John Franklin than the inclosed account. He said he was determined to go to the seat of search again, after having wintered, and all the documents received from the Admiralty and others I gave to him.

"I remain, my Lords,
"Your Lordships' obedient servant,
"JOHN PARKER, Master.

"P.S. *Truelove*, five whales 75 imperial tons. Intend proceeding westward from this date."

[Memorandum from Captain Parker, of the *Truelove*.]

(1)

"On the 26th of August, 1850, traces were found to northward of Port Innis, Wellington Channel, confirming those previously found at Cape Riley by Captain Ommaney. These consisted of fragments of clothing, preserved meat tins, and scraps of papers, one of these bearing the name of M'Donald, medical officer of the expedition."

(2.)

"On the 27th, Captain Penny's parties reported graves. These were at once visited by Captain De Haven Mr. Penny, and Dr. Kane. They bore respectively the names of W. Braine, R.M., and John Hartnell, of the *Erebus*, and John Torrington, of the *Terror*, the date of the latest dating being the 3d of April, 1846.

"Added to these sad but unmistakeable evidences were the remains of the observatory, carpenters' shop, and armourer's forge. Upon the hill side and beach were fragments of wood, metal, and clothing, with stacks of empty meat tins. Everything indicated permanency and organization. There can be no doubt that the cove between Cape Riley and Beechy Island, facing Lancaster Sound, was the first winter station of the missing vessels.

On the 1st of Sept. the impervious ice of the Wellington Channel underwent a complete disruption, and by the 6th several vessels penetrated to the Cornwallis side. Such, however, was the impenetrable character of the ice pack in Lancaster Sound, that by the 10th of September the entire searching squadron were again concerned about eight miles south of Griffith's island.

"This was the farthest western point the American expedition. The next dates from Commodore Austin are of the 13th of September. They were then in momentary expectation of mating winter quarters, and it is probable that a small harbour almost identical to Captain Ommaney, about three miles east of Cape Martyrs, will be the haven selected.

"Thence the American vessels, while proceeding homeward, were frozen in opposite Wellington Channel, drifting during the ensuing winter from a latitude of 75 25 throughout the channel and sound into Baffin's Bay. Their liberation, after much exposure and trial, took place on the 10th of June, 1851, at a point south of Cape Walsingham, 60 30—a linear drift exceeding 900 miles.

"The complexion of the whole affair is unquestionably was their chief source of trial. Every officer and man had marked scorbutic disease, but no deaths have occurred. The crews are now refreshed, and the expedition is endeavouring to regain the seat of search.

"I have, &c.,
"E. K. KANE, Surgeon to the Expedition."

We give below an extract from the *New York Tribune* of August 19, which exhibits the American feeling upon this subject:—

"The surprise and disappointment which were felt when, some time since, we heard of the change of purpose on the part of the British Admiralty, relative to the despatching a steamer to join the English and American vessels in search of Sir John Franklin, are, it is believed, giving place to a feeling likely to produce positive good. It is altogether probable that an American steamer will be sent out in place of the promised English steamer. England had announced to the world her excellent intentions, and this announcement was undoubtedly a principal cause for the failure of the proposition of Mr. Soward, of the United States Senate, at the last session of Congress. But for that announcement, a powerful propeller, bearing our flag, would, months ago, with its presence and its supplies, have gladdened the hearts of our countrymen and friends in the Polar Seas, and would be now leading the way in its great enterprise of humanity. We need not inquire why the Admiralty, after deciding upon a measure far more likely to ensure success than any yet tried, have failed to accomplish their design. It is enough for us to know that the project was and is a good one, and that we are in every way able to contribute to it.

"The superiority of a steamer to all other vessels in the power of penetrating the ice and of extricating herself from difficulty with comparative ease, illustrates her certain efficiency for the service, and requires no comment or explanation.

"Our other enterprises in steam navigation have been successful, and in the face of a formidable competition. Our confidence in our ability to perform this enterprise also are we prepared, and success in it will be a crowning honour. Not an officer, not a seaman of the navy, or of the entire marine of the United States—from the veteran to the boy before the mast—but would consider it a privilege to bear the date of yesterday—but would deem it a glorious privilege to be one of the company bound outward upon that adventurous steamer's deck; for he would go attended with the generous hopes and most heartfelt prayers of every son and daughter of his country.

"It was so when the expedition fitted out by Mr Grinnell went to sea—and it will be so again, when, as we hope, the people of the United States shall, by the fraternal act now proposed, be convinced that which, with our present information, we cannot help regarding as the error of England in this matter.

"If, as by the English papers we are led to believe, probable traces have very recently been discovered of the intended rendezvous somewhere to the north of Lancaster Sound; and more especially if the English vessels now in those seas are, as reported, likely to suffer through total ignorance of the place where the provisions sent out last year were deposited (the captain of the supply ship having, as is said, been guilty of a most unaccountable blunder), then is it all the more necessary that what is to be done should be done quickly.

"No doubt the subject will be brought before Congress at an early period of its coming session."

THE PORTRAITS.

The Portraits upon the preceding page have been engraved from photographs by Mr Beard. Previous to the sailing of the *Erebus* and *Terror*, Mr. Beard was commissioned to supply Sir John Franklin with a complete Daguerreotype apparatus, to take out with him; and with very little exception, of which notice is to accompany him, in command of the *Terror*. Captain Fitzjames also, a young officer greatly beloved in the service, who had much distinguished himself on the Euphrates expedition and in Syria, and had been severely wounded in China, was appointed to serve under Sir John Frank in in the *Erebus*, and to conduct the magnetic observations. With such men as leaders, it is not to be wondered at if the choicest spirits in the service sought to be followers, and if among the crews of the *Erebus* and *Terror*, mustering, as they did when they sailed, a band of 138 persons, were to be found officers as good, and seamen as brave and stout ever trod the deck of a man-of-war."—*W. L. O'Byrne.*

THE ILLUSTRATED LONDON NEWS.

METROPOLITAN NEWS.

CHRIST'S HOSPITAL.—On Monday, the 22d inst. (as the 21st, St. Matthew's Day, falls on the Sunday), the Lord Mayor, Aldermen, and Sheriffs, with the Governors of several London hospitals, will attend divine service at Christ's Church, Newgate-street, where a sermon will be preached by the Rev. E. W. Belton, M.A., perpetual curate of St. Bartholomew's, Bethnal-green; after which they will repair to Great Hall in Christ's Hospital, when four orations, on the benefits of the Royal Hospitals, will be delivered, according to annual custom, by four of the senior scholars: in Latin, by H. D. Sweeting; in English, by G. W. Brown; in Greek, by R. A. Lloyd; in French, by G. G. Ball. Seven poems will also be recited by others of the senior scholars; viz., A Latin Alcaic ode on "Columbus," by C. H. Pare; a translation of the "Chief Justice's Apology and King Henry's Reply," from Shakspeare, into Greek hexameters, by H. B. Parkes; Latin elegiacs on "Lucretia," by H. H. Stone; Greek Sapphics on "Queen Elizabeth," by J. G. Gauntlett; a translation from Campbell's "Pleasures of Hope," on Scepticism, into Latin hexameters, by J. Winterbone Doren; Latin Sapphics, "England's Invitation to the Nations," by H. R Jovers; an English poem on "Rome," by H. Ludlow.

ST. MARY'S HOSPITAL, PADDINGTON.—On Wednesday a quarterly court of the governors of this hospital was held in the board-room of the institution, when ten medical governors were appointed to form, in conjunction with the ten medical officers, a medical committee for the ensuing year. It was reported that during the three months that the hospital had been open the number of in-patients had been 170, and nearly 500 patients had been attended and supplied with medicine during the same period. It further appeared, that the hospital was at present only furnished with fifty beds, although calculated to accommodate 150 patients; and the applicants for admittance had consisted of a much larger number than the hospital was at present capable of receiving.

OPENING OF ST. THOMAS'S CHURCH, WATERLOO-ROAD.—On Tuesday, a new church, which has been dedicated to St. Thomas and erected in the Waterloo-road, a few yards south of Oakley-street, was formally opened for Divine service under licence from the Bishop of Winchester. Divine service was preached, in the morning by the Rev. Charles Kemble, M.A., incumbent of Stockwell, and in the evening by the Rev. Edward Auriol, M.A., rector of St. Dunstan's-in-the-West, and liberal collections were made in aid of the endowment fund. Arrangements are in progress for erecting a new church for another of the districts into which the extensive parish of Lambeth has been divided—that in which the Rev. Alfred S. Cauney, formerly one of the curates of All Souls, Gordon-square, will be the officiating minister. The patronage to the incumbency of St. Thomas's will be vested in the Crown and the Bishop of Winchester alternately.

VISIT OF CUSTOMS' OFFICERS TO THE GREAT EXHIBITION.—The Commissioners have, on the application of the inferior classes of day pay officers in the Customs establishment in London, granted them three days each for the purpose of visiting the Great Exhibition. This privilege is extended to the subordinate officers of the tide or river department, as well as to the officers of the landing department, under certain regulations to ensure the application of the permission to be absent from duty for the stated purpose. We believe that the Commissioners have granted a similar privilege, but to a more extended period, on account of the greater distance from the place, to the subordinate officers of Customs at Liverpool, Southampton, and other places, if they feel desirous of availing themselves of leave to visit the Great Exhibition.

THE BLOOMER COSTUME AT BROMPTON.—For several days past three young and beautiful ladies have astonished the "natives" of Brompton-square and its neighbourhood by appearing in the full Bloomer costume. The dress consists of something between a gipsy hat and a "wide-awake," of straw; a white collar turned down upon a velvet coatee of Lincoln green, buttoning tight round the waist, but open, and showing a frilled shirt-front at the bosom, the sleeves fitting the arms closely, and the skirts descending to the knee. The "Bloomers" are exceedingly full to the knee, but tight from thence to the ancle, where they are drawn close. The dress of the ladies were splendidly furnished, and they wore neat leather half-ancle shoes, with silver buckles and brilliants. On Wednesday the costume again appeared in the West-End. Two ladies, attired in short black silk petticoats, reaching below the knee, over silk trousers, fastened at the ancle, showed neat boots, with a short jacket for the upper garment, over which was worn a scarf, the head-dress being the bonnet usually worn by females, appeared in Piccadilly, St. James's-square, and vicinity, their unusual costume attracting considerable notice. They had a number of small handbills, addressed to "Mothers, wives, and daughters," inviting them to the ranks of "dress reforms," and to join the association of bloomers, founded at Seneca Falls, New York, by "milliners, dress-makers', &c. The leader of the movement is said to be a Mrs. Dixter.

SALE OF THE OLD HOUSE OF COMMONS.—The sale by auction of the materials of the old House of Commons was commenced on Wednesday, within the space on which Canning, Castlereagh, Perceval, Sir Charles Wood, and Graham—the seats upon which sat all these distinguished men—were exposed for sale to builders as old rubbish. In front of the premises to be sold a boarding has been constructed, which will be kept up during the progress of the building, when it is to be raised to a greater height, for the purpose of preventing the public from interfering with or delaying the workmen who are to execute the service which is to occupy the next few months.

CITY AND METROPOLITAN IMPROVEMENTS.—In the late session a local act was obtained, vesting the powers originally granted to the Clerkenwell Improvement Commissioners in the City of London Commissioners; and the result has been that considerable progress has been forthwith commenced to complete the City and Metropolitan improvements commenced some time back. The New Victoria-street from Farringdon-street to the Angel, at Islington, is completed; and in Spring-gardens, Vauxhall, a direct communication to the different docks will be proceeded with; so that in a short time the City and Metropolitan improvements will be so not in name only, but in reality. The sum obtained in the late session for the purposes mentioned are being made.

TOUTERS.—On Wednesday, in consequence of the hindrance to business, and the great inconvenience and annoyance occasioned to passengers landing at London-bridge Steam Packet-wharf, arising from the immense number of pretended hawkers and beggars that infest the locality, orders were issued that none should be allowed to enter unless they bring an authority from the hotel they represent, and only one will be allowed from each establishment. A great many foreigners have been dragged to disreputable places by these fellows, and terribly imposed upon.

FATAL ACCIDENT AT THE NEW HOUSE OF LORDS.—On Wednesday afternoon Mr. Bedford held an inquest at the Crown and Thistle, Great Peter-street, Westminster, on the body of Thomas Stanton, aged 45, a labourer at the New House of Lords, who met his death there on Monday last. Deceased was helping to fix a landing-place, at the height of twenty-one feet from the ground, when he overbalanced himself and fell that height, his head striking a stone step. He was immediately taken to the Westminster Hospital, but, on his arrival, was found to be quite dead. The jury, without hesitation, returned a verdict of "Accidental death."

BALLOON ACCIDENT.—On Monday evening, a balloon ascent took place from the Symposium of M. Soyer, at Kensington, about half-past six o'clock. There balloon was of a spare size, and of the usual size. The persons in the car were Mr. Chambers, sen., Mr. Chambers, jun., Mr. Gardiner, and Mr. Sella, the artist, Mr Chambers, sen., having the management of the ascent of the balloon, which was to be performed by Mr. Sella. The balloon had made some considerable height, took a south-westerly direction towards Fulham, still rising as it proceeded; but in a very few minutes an alteration suddenly appeared in the shape of the balloon, and it was immediately evident that an accident had happened, and that the top of the balloon had collapsed, and it was fast descending to the earth, which it fortunately reached in the market garden-grounds of Mr. George Bagley, opposite the Bishop's-walk, at Fulham. The descent was in the car sustaining the lightest lurch beyond the sudden shock and alarm into which they were thrown by the accident, and Mr. Sella having slightly hurt one of his elbows. It appeared that the first intimation of danger was by a rent in the bottom of the balloon, which speedily extended to a point, the gas expanding the balloon at a pressure of 15lb. to the inch, and directly Mr. Chambers was aware of the fact, he, with great presence of mind, with his arm, collapsed the upper part of the balloon, and thus, by his coolness and skill, undoubtedly saved the lives of the whole party. Mr. Sala gives the following account of the accident which befel himself and his fellow voyagers:—"We ascended steadily, and pursued our course at a moderate pace in a river in a south-westerly direction. Mr. Chambers, the person who was permitted by Mr. Sala (the owner of the balloon) to become the conductor *pro tem.* of the lives of his companions, was busily engaged in throwing away some ornamental figures of paper attached to the car, and I was admiring the wonderful panoramas beneath me, when I heard a report like that of a musket above my head, and immediately exclaimed that there was a rent in the balloon; an assertion denied by Mr. Chambers, who had got by this time among the netting, and ordered us to throw out ballast; notwithstanding which, we descended with frightful velocity, the balloon shrunken, and the bands in getting horribly nearer and nearer every second. Exclamations of 'We're all right!' 'We're all right!' half despairing, broke from us, followed by an awful cry from one of the party, 'It's all up!' Then we three, and the man in the car stared death in the face for some forty seconds, while Chambers (an old man, but as brave as a lion) had cut the cords attaching the neck of the balloon to the hoop, the consequence of which was that the whole of the silk flew up to the top of the netting, and formed a parachute. We were then steady for a moment—then oscillated (a proof of comparative safety)—then went down, down again, with frightful force. Certain death was now before us, but not one of us lost presence of mind, though I had not the slightest hope of escape: Mr. Chambers was entirely calm and collected. We cut away the grapnel, threw out more ballast (bags and all on my part), and descended, with a concussion which I had not expected, in a market gardener's field. I fell on Mr. Gardiner, Mr. Chambers, jun., on me, three bags of ballast on him, and the car over us all; while "the pilot who had weathered the storm" was thrown with considerable violence from among the cordage round the hoop where he had been standing. So much for the accident itself. The cause, I think, lies in a nutshell; and I am loth to allude to it, since it argues a want of prudence on the part of the person who, by his presence of mind, saved our lives subsequently. When we ascended, the neck of the balloon was tied round with a silk handkerchief. On clearing the earth, the balloon ascended to a higher and much more rarified atmosphere; the atmospheric pressure became less, the gas expanded rapidly, and the balloon burst. What I am stating I know to be true, and I do not state it without the sanction and advice of experienced aëronauts."

CITY OF LONDON REGISTRATION.—According to the abstracts of claims of persons to have their names inserted in the lists of voters from which they have been omitted, and objections taken to names in the lists, returned to Mr. T. Y. M'Christie for disposal at the revision for the City of London, on the 23d inst., they are as follow:—

	Claims.	Total Claims and Objections.
Freemen and liverymen	2 ..	214 .. 216
Inhabitant householders	160 ..	972 .. 1132
	162	1186 1348

The claims, therefore, would appear to be 14, and the objections 85, more than they were last year.

EXTENSIVE FIRE AT CAMDEN TOWN.—On Tuesday night, shortly after eight o'clock, the whole range of workshops belonging to Mr. Newman, carpenter and builder, Murray-street, Camden-town, were discovered to be on fire. All the workmen had left the building apparently quite safe; but an unusual light having been noticed through the window, an alarm was given, and every assistance was rendered by neighbours and police. Unfortunately, no water could be procured for half an hour after the discovery of the fire; and by the time the brigade engines arrived, every portion of the work shops and their contents were destroyed. Some few of the journeymen's took were saved. Mr. Newman is only partially insured (in the Sun Fire Office) against his loss. How the fire originated, was completely unknown.

BALLOON DESCENT AT A LUNATIC ASYLUM.—The veteran Green, having made his 483th ascent from Vauxhall Gardens in the Nassau balloon on Monday evening, accompanied by a party of gentlemen, effected a safe descent on the lawn in front of the Surrey County Lunatic Asylum. Many of the patients, who were enjoying their evening amusements, immediately assisted him in securing the balloon, and tenderly rendered him the required assistance. It being the intention of the company, which consisted of a party of distinguished military officers, again to embark at dawn of day on an aërial voyage, the descent was accomplished with scarcely any loss of gas. Balloon ascents being now of so frequent occurrence, they scarcely deserve any notice in a public journal; but it is with much pleasure that we record this, being a practical illustration of the great improvement which has been effected in Dr. Conolly and others following his humane views, of the treatment of the insane in this country. Here a large quantity of afflicted persons immediately rendered the required assistance; and, although many gentlemen were present, because visited by neighbours from all directions, with whom they mixed, they cheerfully returned to the wards of the building, without any mischievous excitement from the event. Mr. Green and his retinue having received and welcomed by Dr. Diamond, they again ascended early in the morning, Mr Green observing, it had never been his lot to alight in a more suitable or cheerful spot; his companions, some of whom had travelled in the balloon, expressing in many strong language the "immense humanity" now here displayed in the treatment of lunatics, compared with similar establishments they had visited.

FIRE.—About half-past four o'clock on Sunday morning, a fire broke out in an extensive range of premises occupied conjointly by Messrs. Murray and Paterson, Government contractors, sack, bag, &c., manufacturers, and Mr. W. H. Blackmore, rag merchant, situate in Sheppy-yard, Minories. Fortunately, an abundant supply of water was obtained; but the premises being nearly 100 feet long, and the stock in trade so combustible, not much impression could be made. The firemen, however, eventually succeeded in extinguishing the conflagration, but not until the flames were burst out, the roof destroyed, and another floor very considerably damaged by fire and water. The total loss is very serious.

A CHEMICAL FRIGHTENED TO DEATH.—On Wednesday, Mr. Wakley, M.P., held an inquest in the Holborn Union Workhouse, Gray's-inn-road, on the body of a man unknown, about 40 years of age. The deceased, accompanied by a female, went into Mr. Atkinson's Coffee-house, Middle-row, Holborn, at three o'clock on Monday morning, and called for refreshments, in payment for which he tendered a bad crown piece, and, although perfectly sober, was very insolent. Mr. Atkinson gave him in charge to the constable on duty, and while the deceased was being conveyed to the police-station, deceased fell to the ground, exclaiming "You must carry me." Four other police constables aided in carrying him to the police station, and upon arriving there they found the victim a corpse. The workhouse surgeon, who made the post mortem examination, said that death had resulted from an effusion of blood on the brain, produced, in his opinion, by fright. Verdict accordingly.

BIRTHS AND DEATHS.—In the metropolitan districts, the births registered for the week ending Saturday last, Sept. 6, were—Males, 777; females, 723: total, 1500. The average of six corresponding weeks in 1843-50 was 1344. The number of deaths returned was 967, a decrease of 94 on those of the preceding week. Of this number who died at stated ages, only 144 had attained the age of 60 and upwards; 518 were children under the age of 15; and 303 were men and women under the age of 60. Convulsions, small-pox, measles, scarlatina, and hooping-cough, hydrocephalus (water on the head), destroyed many children; but diarrhœa in this week was more fatal than all these diseases together. Consumption was fatal to 103, typhus to 25, heart disease to 14, bronchitis to 11, and violence to 10 persons under the age of 60. The deaths from diarrhœa increased from 23 in the first week of July, and 143 in the first week of August, to 162 in the first week in September. The deaths from cholera also increased from 2 to 14 in the same period. It differs in this respect, that the course of the fatal cases is much less rapid. This is the anniversary of the most fatal week of the great cholera epidemic of 1849, when 2134 of the inhabitants of London died; and the contrast between the health of the great city then and at the present time is gratifying, particularly as it is now the abode of so many thousands of strangers. It would be still more gratifying if the danger of cholera were at an end; but as there was, as it might be diminished by the removal of a thousand nuisances still existing, and laying the population open to the invasion of every epidemic.

METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean height of the barometer in the week was 30.038 in. The mean temperature of the week was 60.5 deg., about 1 deg. below the average of corresponding weeks in ten years. The temperature was highest on Tuesday, when the mean was 67.2 deg., and lowest on Sunday, when the mean was 54.9 deg, or 5.6 deg. below the average of the same day in ten years. The wind generally blew from the north-west during the first three days, and then from the north-east to the end of the week.

In a recent number of the *Literary Gazette*, it was stated, that M. Simonides, a Greek *savant*, had discovered in the old papers of a Greek convent an indication that the original MS. of the "Acts of the Apostles" was buried in an island in the sea of Smyrna. Search has been made in the spot pointed out, and that it has led to the discovery, not of the "Acts," but of a copy of one of Aristotle's treatises, and a map of the islands. The things appear to have been interred about the year 1204.

The celebrated Berlin wit and comic writer, Saphir, who has resided some twenty years in Vienna, has been tried there according to the articles of war, and imprisoned on the 6th inst., for writing an article containing disrespectful allusions to the late Royal letters to the Ministers concerning the reform in the Government.

AUTOGRAPH LETTERS.—In Mr. Davies' collection of autographs, sold on Wednesday and Thursday last, by Messrs. Sotheby, Wilkinson, and Simpson, of Piccadilly, were some interesting lots, although the bulk of the collection offered nothing very remarkable. We quote a few of the most noticeable, with their prices:—Lot 45, a portrait of Queen Elizabeth, in the costume of Melancthon, G. Major, and Caspar Cruciger, sold for £4 12s. Lot 88, also a printed book, in which were inserted autographs of Oliver Cromwell and several of the regicides, sold for £1 10s. Lot 114, a letter of Edward IV., sold for £6 2s. 6d., although in bad condition. Lot 115, some letters of Frederick the Great, each letter signed by the King, sold for £3. Lot 152, a letter of Henry Bell, the first who successfully applied steam-power to the purposes of navigation in Europe, sold for £1 11s. 6d. Lot 173, a short letter of Edmund Kean, sold for £1 11s. Lot 223, a letter of J. J. Rousseau, sold for £1 10s. Lots 229 to 240, twelve letters of P. B. Shelley, very uninteresting as regards their contents, sold for £7 1s. Lot 246, a short letter of Lawrence Sterne, sold for £1 7s. Lot 254, a letter of John Wesley, and one of his father, sold for £1 1s. Lot 329, a letter signed by the celebrated Wallenstein, sold for £4. Lot 335, some autograph MS. on astronomical subjects, by Lagrange, sold for £2 19s. There were also many letters throughout the sale addressed to Elizabeth, Queen of Bohemia; they were generally uninteresting, but, being in great preservation, they sold well.

The magistrates of Prague have issued an order that no Jew shall be allowed to reside in those parts of the town inhabited by Christians, without the permission of the magistrates, under pain of a fine of seventy-*one* florins.

NEW YORK POLICE STATISTICS.—The *New York Herald* has published a tabular report of the chief of police of that city, from the 1st of April to the 30th of June, in the present year, showing the number of persons apprehended, and for what offences. From these returns it appears that there were 9807 arrests in the city and county of New York during the quarter—13 of which were for murder—being a total increase of 1841 arrests over the preceding quarter for all offences, and an increase of 1000 under each head. During the quarter 12,403 persons were accommodated with lodgings in the various station-houses in the city, which shows a decrease of 2996; 1300 lost children were restored to their parents; 184 sick and disabled persons aided—an increase of 39; 42 persons rescued from drowning—being an increase of 9; 54 fires extinguished—increase of 2; 309 stores, dwellings, and offices found open at night—an increase of 98; 21 cattle found astray and restored; 113 horses found astray and restored—increase of 12; 13,133 dcl. 69 c. taken from lodgers and drunken persons and restored—an increase of 3592 dcl. 74 c.; 17 gold and 48 silver watches restored to owners. The number of days lost by policemen, during the quarter, in consequence of sickness or disability, was 1817, averaging 20 men per day, and being a decrease of 248 days from last year. The total effective force during the quarter was 982 men. There were 90 complaints made against policemen, being a decrease of 9; 63 policemen were suspended from pay, 10 resigned after complaints were made, and 18 complaints were dismissed. The effective force of the police department on the 1st of July was 19 captains, 38 assistant captains, 76 sergeants, 803 policemen, being a total of 936. Out of these, 141 men are usually detached for special duty. There are 6003 "drinking shops" in the city, of which 4408 are licensed, 1595 unlicensed, and 4185 open on Sundays.

EPITOME OF NEWS.—FOREIGN AND DOMESTIC.

The Messrs. Smith, of St. Peter's Quay, on the Tyne, have contracted with Messrs. Hartley and Co., of the Wear Glass-Works, Bishopwearmouth, for the entire enclosure, with glass, of their extensive shipbuilding yard of St. Peter's, where vessels of the highest class and character, and of the largest register tonnage, are constructed. The glass for the roof is to be the Messrs. Hartley and Co.'s celebrated rough plate, of which a very large quantity will be required. Messrs. H. and Co. have engaged Mr. Isaac Cooke for the glazing. Vessels built under cover class a year higher at Lloyd's.

The magnificent entrance of the Conservatoire des Arts et Métiers, in the Rue St. Martin, Paris, is now completed. It is ornamented with a pediment and caryatides. It enters into the Court of Honour, where is the entrance to the galleries. On the left are the new buildings containing the theatres; on the right, the ancient refectory of the convent, to be occupied as a library; also the curious chapel, constructed without a single column or pilaster; here will be erected a steam-engine. The following galleries are now completely reorganised, on the ground-floor:—1. The Weights and Measures of all Ages and Countries; 2. Machines for Weaving; 3. Agricultural Implements; 4. Models of Manufactures and Steam-Engines; 5. Raw Materials; 6. Pottery; 7. Philosophical Instruments; 8. Clocks; 9. Mathematical Instruments; 10. Lathes; 11. Optical Instruments; 12. Miscellaneous.

The Bristol and Exeter Railway Company and the Great Western Railway Company have had to make restitution to Messrs. Ford and Co., the carriers, for overcharges made upon them in attempts to monopolise the carrying trade; and the South Devon Railway Company is under an ordeal of Mr. Justice Patteson to do the same thing.

Sir R. Kane, Professor Sullivan, and Professor Murphy have been requested by the Lord-Lieutenant (Ireland) and departments of the Woods and Forests to proceed to the works of Mr. Darcan, at Kildrum, near Cork, for the purpose of making a report upon the whole of the process connected with preparing flax, including the invention of the Chevalier Claussen.

The Earl of Clare has been appointed to the lieutenancy of the county of Dublin, vacant by the death of the late Earl. It will be remembered that the noble Earl, then the Hon. R. Fitzgibbon, originally held this office, in which he has been reinstated upon succeeding to the title and family estates.

The Chantilly (near Paris) races are fixed for the 12th October. The principal stake, the Omnium, is of 10,000f. The Paris races are to take place on the 19th, 23rd, and 26th October. The Government Stakes are to be run for, and the principal of them is the Grand Prix National, of 14,000f. The number of horses in training in the vicinity of Paris is unusually great (about 200), and capital sport is expected.

An agent of the French government is now in Madrid, charged with the mission of laying down the basis of a treaty between France and Spain for the suppression of literary piracy. His overtures have been very favourably received by the Spanish cabinet.

M. Arago states, in a recent paper to the Academy of Sciences at Paris, that the following is the annual average number of storms at the places mentioned:—Paris, 13; Toulouse, 15; Pithiviers, 20; Smyrna, 19; Buenos Ayres, 30; Guadaloupe, 27; Rio Janeiro, 50; Calcutta, 60; Berlin, 18; Strasburg, 17; Utrecht, 15; Athens, 11; St. Petersburgh, 9; London, 8; Pekin, 8; Cairo, 3.

Manks, the pedestrian, who undertook to walk 1000 quarter miles in 1000 quarter hours, 1000 half miles in 1000 half hours, and 1000 miles in 1000 hours, without intermission, on the Barrack Tavern ground, Sheffield—a feat never before attempted—finished his great undertaking on Thursday afternoon week.

A parcel of writing-paper of French manufacture having been imported from Havre, having a crown and the word "Bath" stamped in the usual place, at the top left-hand corner, and also contained in wrappers likewise the words "Bath superfine," thereon, for the purpose of exportation, it was decided that it could not be allowed to be exported with this false character, having been illegally imported for that purpose, but must be returned to the port from which it had been shipped to this country.

Duncan Dunbar, Esq., the extensive London shipowner, and a leading Protectionist, is spoken of as likely to come forward at the next election as a candidate for the representation of the borough of Sunderland.

The Protectionists of Brecon and its neighbourhood are striving to induce Sir Charles Morgan, Bart., to come forward at the next general election to contest the representation of the borough with Lloyd Vaughan Watkins, Esq., who has for some years been the sitting member.

The annual exposition of 1851 at the Palace of Fine Arts, Paris, commenced on the 3d with an exhibition of engravings. On the 10th, 11th, and 12th, the works of young sculptors were exhibited. On the 17th, 18th, and 19th, the works of young architects; and on the 25th, 26th, and 27th, historical paintings are to be exhibited. A general exhibition will be open from the 5th to October 5th. The distribution will take place at the Palace on the 4th of October.

The foundation-stone of a new church, about to be erected at the bottom of Legram's-lane, Horton, Yorkshire, has been laid. The name of the church is to be St. Andrew's, and a clergyman, in the person of the Rev. E. Mercer, has been labouring in that locality for several months back.

The French Brigadier-General Creny, of the army of Africa, now in Paris on leave of absence, has been placed on the non-effective list, for having attended the commemoration of Louis Philippe's death in England lately, contrary to the rules of the service, which prohibit an officer from going to a foreign country without permission from the executive power.

The monument of the illustrious historian, Jean de Müller, has been inaugurated in his native town, Schaffhausen, Switzerland. It is composed of a colossal bust in marble, placed on an elevated granite pedestal, ornamented with a bas-relief representing Johannes Müller in write the great events of his country. Underneath is a German inscription, in golden characters. The sculptor is M. Oechslein.

An Indian paper refuses to publish eulogies gratis, but adds:—"We will publish the simple announcement of the death of any of our friends with pleasure."

On Sunday night a terrible conflagration broke out at New House Farm, Ewhurst, the property of, and occupied by, Lord Harry Vane. Some labourers' children who were encamped near the premises had obtained lucifer-matches and went into the straw-yard. By accident they fired the straw, which communicated with the farm-buildings. A barn, with thirty loads of peas in the haulm, a loaf of which were white, and a lodge, were burnt down. Great praise is due to the labourers in assisting, otherwise a pea-stack, and a beanstack and a hay-stack, which stood within a few feet of the barn, must have been burnt down.

The *Cincinnatti Citizen* says that a hosier in that town painted as his motto on his sign, "*mens conscia recti.*" A man in the same town who lived opposite, imagining that it was some new article in the hosiery line, resolved not to be outdone by his rival, who was a new comer, repainted his own sign, with the addition of "men's and women's *conscia recti.*" The people of the United States seem to be as unscrupulous about appropriating old Joe Millers as any other unconsidered trifle from the old country.

The trustees of the Rochdale Savings' Bank have ordered a placard to be posted, stating that "a dividend of 2s. 6d in the pound will be paid at the premises formerly used as the bank, New Wall, Rochdale, to the depositors."

Galway Bay at the present time is full of herrings, and the haul on Saturday night last gave each boat from 1000 to 4000, most of which went up by rail to Dublin market.

A basket-hilted sword was found on Culloden Moor on Tuesday week, near the stone known as the Duke of Cumberland's resting-place on the day of the fatal fight.

Amongst the carriages destroyed by the late fire at Mr. Horne's coach manufactory in Long-acre on Sunday morning week, were the splendid new state carriages for the Spanish Ambassador. One has yet been discovered as to the origin of the fire. The destruction of property is supposed to exceed £20,000.

One of the soldiers of the 30th Royals, now in Winchester, has voluntarily resigned himself into the hands of the police, acknowledging that he is amenable to the law for murder committed on a young woman in Norwich, about fourteen years ago.

On Monday a corrected Parliamentary paper of the census in Ireland was printed. The decrease is 20 per cent between 1841 and 1851. In 1841 the total number of persons was 8,196,124; and on the 31st of March last, 6,515,794; showing a decrease of 1,680,330, or 20 per cent.

The privilege of the Teatro d'Oriente at Madrid having been offered for several weeks to public competition, without any acceptable offer being made for its purchase, her Majesty has taken it on her own account, and named M. Tamburini, the Milan tenor, the director.

M. de Manteuffel, President of the Council of Ministers in Prussia, has received a decoration from the Sovereign Pontiff.

The Paris papers justly complain of the wholesale literary piracy which is carried on in Brussels. Incredible as it may appear, fac-similes of many of the Parisian journals, particularly of the *Débats* and *Charivari*, are fabricated there on the day of their publication, and are transmitted to many parts of the Continent, where they often arrive several hours before the originals. This is explained by the execrable postal arrangements in Germany. A traveller may now go by railway from Paris to Berlin or Dresden in 38 hours. Letters and newspapers take post-horses four days.

The *Voss Gazette*, under date of Vienna, 3d instant, says:—"Some journals have given an incorrect statement of the amount which one Government sent in part payment of the arrears, as an indemnity for the military ate-operation in Hungary in 1848. The real facts of the case are as follow:—By a convention of the 10th June, Austria is bound to pay to Russia 5,668,218f. As part of this sum will be taken in salt and the rest in money, in three equal payments, the first in crost, from the 31st July, 1850. The first instalment was due on the 31st July last.

The firm of Messrs. Maudslay and Field have just commenced the erection of a branch establishment at Malta, for the purpose of carrying on the marine steam machinery. The site upon which the workshops and establishment will be erected has been given by the Government. The advantages which such an establishment will confer upon the steam marine of this as well as other countries navigating the Mediterranean are too obvious to require comment, and we cordially trust that this eminent firm will meet with the success which their enterprise so justly merits.

CHESS.

TO CORRESPONDENTS.

B E, of Ashford—Of the first three of your Problems, No 1 is transferable, and Nos 2 and 3 too easy. In the last with which you have favoured us, mate may be given in two or three ways.

R B W—No 24 is palpably wrong. The others will pass muster, though certainly inferior to many of your contributions.

BARON B—You are mistaken. Look again at No 393.

G F H—There is nothing problematical in such a position. A child would fathom it at a glance.

G S.—The mate in each is palpable at first sight.

M W A, Bagshot—We can see no advantage that would accrue to White by playing as you suggest. He certainly avoids by it the perils arising from Black's move of Q to K 5 th, but his Pawns remain doubled, and his Queen exposed to immediate attack.

JUPE—The acquisition of B Q to her 5th, is ingenious and practicable; but the other suggestions we must demur to.

CAMBRENSIS, 1 2—Wrong in both instances.

L P D, Queenbury, Wetherby—The King can Castle after having been checked. See the article "Castling" at page 19 of the "Chess-Player's Handbook."

G F H—There is nothing problematical in such a position. A child would fathom it at a glance.

Leadenhall—We never heard of "the Enfield iron men."

EACHUS—The few remaining copies of Major Jaenisch's unrivalled work, "Analyse Nouvelle des Ouvertures en Jeu des Echecs," have just been secured by Messrs Williams and Wells (the Cheverstone-street Chess-Rooms), who have also in their possession the only two Norgate, the foreign bookseller. Complete in two volumes, the price is only 18s. No "e" so nobly should seek to avail themselves of this opportunity of possessing this famous treatise.

TYRO—A player having taken up his adversary's piece is bound to capture it, if it can be legally taken.

W T—A King and Bishop alone cannot give checkmate.

VIATOR—The four volumes of *la Berliner Schach-Zeitung* abstracted from the Salon of the Tournament, were presented to the 'de George's Club by the members of the Berlin Chess Club as a testimony of friendship. Any information which may lead to the discovery of the party who took them should be forwarded to the Hon Secretary without delay.

VOX D, Berlin: and K——T, Paris—The numbers of the "C P G" have been regularly forwarded, according to the convention, but no later than June, July, nor August numbers of the Berlin or French Magazine have been received in return. It is requested they may be sent immediately.

CHESSLING—Hardly up to our mark.

W H, Camden Town—It shall appear.

SOLUTIONS of PROBLEM No 397, by Stevens, W N A, Bodonia, Argus, L D, S P Q B, M P, Smyrna, F R S, M D.

SOLUTIONS of ENIGMAS by M P, Stevens, S P Q B, Argus, Nautilus, Triton, F R S, Mitre, are correct. All others are wrong.

SOLUTION OF PROBLEM No. 395.

WHITE.	BLACK.	WHITE.	BLACK.
1. K to Q 4th (ch)	K to Q Kt 3d	3. Kt to K B 5th	R to Q R sq
2. B to Q 5th (ch)	Q to her B 3d	4. B takes R	Q must take B,
		giving mate.	

SOLUTION OF PROBLEM No. 396.

WHITE.	BLACK.	WHITE.	BLACK.
1. P to Q 4th (ch)	K to his B 5th (best)	3. Kt to K 3d (dis ch)	R takes R
2. B to Q R 2d	Q takes B (best)	4. Kt to K 2d—(Mate)	

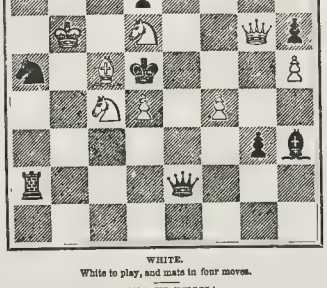
SOLUTION OF PROBLEM No. 397.

In this position the key move is—1. Q to her Kt 8th.

PROBLEM No. 399

By R. B. W., of Oxford.

BLACK.



WHITE.

White to play, and mate in four moves.

CHESS IN RUSSIA.

The two following games were lately played at St. Petersburgh, between Messrs. SCHUMOFF and JAENISCH.

(Sicilian Opening.)

WHITE. (M. Schumoff.)	BLACK. (M. Jaenisch.)	WHITE. (M. Schumoff.)	BLACK. (M. Jaenisch.)
1. P to K 4th	P to Q B 4th	14. Kt to K 4th	Q takes Q B P
2. P to Q 4th	P takes P	15. Q R to K sq	K Kt to K 6th (c)
3. Kt to K B 3d	P to K 4th	16. K takes Kt	P takes R
4. Kt takes K P (a)	Q to Q R 4th (ch)	17. Q to K B 6th	Q to K 7th (d)
5. P to Q Kt 4th	B takes P (ch)	18. Kt to K B 6th (ch)	P takes Kt
6. B to Q 2d	B takes B (ch)	19. P takes P	Q to Q B 7th (e)
7. Kt takes B	Q takes K Kt	20. Q takes Q	P to Q 4th
8. B to Q 3d	Kt to K B 3d	21. Q to her 3d	P to Q 5th
9. Castles	Castles	22. Q to Q Kt 5th	K R to Q sq
10. P to K B 4th (b)	Q to Q B 4th	23. R to K B 3d	B to K B 4th (f)
11. P to K 5th	K Kt to Q 4th	24. Q takes B	Q Kt to Q B 3d
12. B takes P (ch)	K takes B	25. Q to Q B 5th	
13. Q to R 5th (ch)	K to Kt sq	And Black resigns.	

(a) By this hasty slip, White loses a piece at the very outset of the play; a loss, however, which is hardly to be deplored, since it gives rise to an attack on his part more brilliant and spirited than we often see in modern days.

(b) From this moment the assault is admirably sustained.

(c) Though apparently a good move, this really was a fatal error.

(d) Better to have given up his Q by taking the Kt, or playing P to Q 4th at once.

(e) His only resource to avoid immediate mate.

(f) Here, again, Black has no alternative but to lose even losing another piece or being mated at once.

BETWEEN THE SAME PLAYERS.

(Allgaier Gambit.)

WHITE (M. S.)	BLACK (M. J.)	WHITE (M. S.)	BLACK (M. J.)
1. P to K 4th	P to K 4th	21. Q Kt to K 4th (c)	Q to K 2d
2. P to K B 4th	P takes P	22. Q Kt to Q 6th (ch)	K to Q B 2d
3. Kt to K B 3d	P to K Kt 4th	23. Q Kt takes K B P	R to K to K B 2d
4. P to K R 4th	P to K Kt 5th	24. B takes Q B P (d)	P takes B
5. K Kt to K 5th	P to K R 4th	25. Kt takes R	K Kt to Q 4th (ch)
6. B to Q B 4th	R to K R 2d	26. K to B 2d	R takes Kt
7. P to Q 4th	P to K B 6th	27. Q takes Q B P	K takes Kt
8. P takes P	P to Q 3d	(ch)	
9. K Kt to Q 3d	B to K Kt 5th	28. Q to Q R 8th (ch)	K to B 2d
10. B to K 3d (a)	B takes K R P (ch)	29. Q takes Q R P	K to B sq
11. K to Q 2d	P takes P	(ch)	
12. Q takes P	B to K Kt 5th	30. Q to Q R 6th (ch)	K to Kt sq
13. Q to K Kt 2d (b)	K R to K Kt 2d	31. Q to Q Kt 5th (ch)	K to B 2d
14. Q Kt to Q B 3d	B to K Kt 4th	32. Q to Q B 5th (ch)	Q Kt to Q Kt 3d
15. Q R to K B sq	B takes B (ch)	33. Kt takes K Kt	R to Q Kt 2d
16. Q R takes B	Q to Kt 4th (ch)	34. Kt to Q 3d	Q to K B 2d (ch)
17. Q R to K B 4th	Q Kt to Q 2d	35. K to K sq	Q to K B 6th
18. P to K 5th	P takes K P	36. K to K 2d	Q to K 6th (ch)
19. Q P takes K P	Castles	37. K to B sq	B to K R 6th (ch)
20. B to Q 5th	R to Q B 3d	38. K takes B	R to K Kt8—Mate

(a) This seems now to be generally acknowledged among good players to be a better move than B to K h3 5th.

(b) Not so strong as Q to K R sq.

(c) By taking the Q B P, White would have got a glorious attack.

(d) The position is one of much interest, from the danger in which both parties stand.

CHESS ENIGMAS.

No. 676.—By J. C. W.

White: K at his 8th, Q at her Kt 3d, B at K B 6th, Kt at K Kt 8th, P at K R 4th.

Black: K at his 5th, Kt at K Kt 8th; P s at K B 6th, K's 3d and 4th, and Q 5th.

White to play, and mate in four moves.

No. 677.—By R B W.

White: K at his 3th Q at K 7th, B at K R 3d, Kt at Q R 6th, P s at K B 4th, K 5th, and Q Kt 3d.

Black: K at Q 4th, Q at Q 3d, R at Q Kt 4th, B s at K Kt 2d and Q Kt sq; P s at K B 6th, Q B 3d, and Q R 2d.

White to play, and mate in three moves.

THE GREAT EXHIBITION.

The increase in the number of visitors is becoming more and more marked every day, and this influx is certainly of the labouring classes, both agricultural and mechanical. Smock-frocks have become abundant during the past week; and not a few of those who wore them carried unmistakable evidence of the localities whence they came, in the form of branches of the hop plant, or bouquets of flowers with such branches forming the central. They had gone out for a holiday, and, of course, took an autumnal peep with them. As regards the artisans of our towns, they, too, are flocking up; and the want of some provision for this purpose, so strenuously urged upon them by the promoters of the Exhibition at the outset of the agitation in its favour, is telling rather painfully upon those whose curiosity is greater than their means. Thus, on Saturday last, at Leeds, one pawnbroker alone was astonished at a sudden influx of about a hundred and a half, imperial measure, of watches, which, on consideration, he had no doubt were deposited with him for the purpose of raising the means to take the excursion train on Monday morning. The more distant Leeds, too, of the working classes of London are appearing on the scene, since they see no prospect of any reduction of the price of admission, and therefore strain a point, and go at once; for the pecuniar epoching on the 1st of May seems to have borne its fruits, and rightly impressed every one with a feeling that the Exhibition will as punctually close.

The new consignment from Sweden is being arranged in the proper compartment, and will certainly do infinite credit to the contributors. Several chandeliers of crystal and glass, of great beauty and elegance, are amongst these articles, together with specimens of mineral manufactures, consisting of vases, tables, &c. Other goods, too, are expected from different countries, and constant applications are being made to the Executive Committee to admit articles on the British side, but with little chance of success, since the space is so thoroughly and completely filled up. Yet, whilst these arrangements, on the foreign side at least, are taking place, preparations for the removal of the whole are going steadily forward. Plans are being organised, by which the great and unequal gathering of the products of human skill will, in a few br of weeks, become only a memory of the past. Its influence, however, has been immense already, and we cannot help seeing many examples of its value, in promoting the development of trade and manufacture, and even in some instances carrying mechanical means for the establishment of industrial operations where none, or comparatively none, existed before.

A most liberal boon made, as an encouragement to the exhibitors, of the prize of 100 guineas, announced in our last as having been given by Lord Elgin for division amongst the Canadian exhibitors, by which the probable results of the Exhibition may be realised, or at least such hints and suggestions thrown out as will tend to show those most interested in what direction they ought to look in future in the employment of the means at their command. Thus, a committee will report on the best method to be pursued in future for the development of Canadian resources. This, if done by all our colonies, would be very valuable; and even certain departments of our home trade might take the hint, and endeavour to draw a lesson from the abundant materials around them. This, we fear, has not yet been done to the extent that it might have been, and, indeed, ought to be done; and as the question now set ting as to the disposal of the surplus in founding an University of Arts and Manufactures becomes more matured, as it seems very likely to be, everything calculated to throw light upon the distinct bearings of the objects exhibited will become doubly valuable. This project has been well received at Birmingham, Sheffield, and even at Manchester, never very forward to take up anything which does not originate within its own locality, or arise out of its own wisdom. The memorials from Sheffield and Birmingham are interesting documents, worthy of careful consideration. Meanwhile, we have another proposition as to the disposal of the Crystal Palace, as having several points of interest. This is put forth in a pamphlet for "private distribution," in the shape of an extract from one of the *Art Journal* Prize Essays, and is by Mr. George Wallis, of the Executive. Of the several departments of the Great Exhibition, who has just been appointed by the Board of Trade as the future head master of the Birmingham School of Design. This scheme is on the "future uses of the Crystal Palace," and proposes that the south side of the Building be walled in, to form two immense picture galleries, with suitable roof-lights, and that the National Gallery pictures be deposited therein—the old masters in one compartment, and the modern paintings in the other; thus remedying at once the want of room in Trafalgar-square, and taking the Vernon Gallery from Marlborough House: the School of Design, now so badly accommodated at Somerset House, to take the rooms in Trafalgar-square, and consequently unite the male and female school under one roof, a-d in a convenient and central situation. The north side of the Exhibition Building it is proposed to use for the purpose of a College and museum of manufactures and industrial art—a similar institution, in fact, to that proposed under the title of an University of Arts and Manufactures, but not taking so ambitious a flight at the outset. Then, to complete the arrangement and meet Mr. Paxton's views, Mr. Wallis proposes that all the central portion of the Building, from the South to the North Gallery, together with the Transept, shall be used, as proposed by Mr. Paxton, for a Winter Park or Garden. The suggestions are illustrated with a plan of the Building, and, doubtlessly, there has been considerable thought bestowed upon the proposition; and it certainly possesses many advantages, and, as some will probably think, quite as many disadvantages. Our object, however, is not to approve or condemn; announcing the proposal as it stands, is all we have to do with. If the Building is to be preserved, however, it would appear that something more practically tangible must be enunciated than has appeared previous to this proposal.

ANOTHER ASCENT OF MONT BLANC.—On the 27th ultimo, Mr. Salmond, of Waterfoot, Cumberland, and his son, Mr. Charles Salmond, accompanied by three guides each, left Chamouny at about ten A.M. The party, eight in all, reached the "Grands Mulets," the usual halting-place, about six P.M., and were received with the usual salute from the valley. They recommenced their journey with lanterns at one A.M., and reached the top of the ridge about nine A.M., and were rewarded by a magnificent view on all sides. At this point, however, they encountered a snow-storm, which rapidly increased to such a degree of severity that, although within 200 feet of elevation of the highest peak, they were unable to reach it, and regained the grand plateau with difficulty and some danger. The party arrived at Chamouny in safety at six P.M. on the 28th. They seem to have had a fortunate escape, for the next morning the hills were covered with snow almost to their base, and the snow still falling.

THE FORTHCOMING REGISTRATION.—A new law for the registration of voters, passed in the late session, will come into practical operation in the forthcoming revision of the lists of voters commencing from Monday next. The new law is entitled "An Act to amend the law for the registration of certain persons commonly known as 'compound householders,' and to facilitate the exercise by persons of their right to vote in the election of borough members to serve in Parliament." By the Reform Act it was lawful for the occupier of a house of the required amount, in a city or borough, to claim to be rated in the relief of the poor in respect of premises wherein the landlord was or was not liable to be rated, and such occupier paying or tendering the rate payable was to be put upon the list. "And whereas it is often inconvenient or impracticable for such persons to make continual claim in respect of such rate, and many persons are, consequently, deprived of the franchise." It is therefore enacted that no person so claiming is be rated, and paying or tendering, on or before the 20th July, the rates due on the 5th January preceding, shall be required to make any further claim in regard to any future rate upon the premises in respect to which his vote in any such election shall arise, but shall be entitled to be put on the list, and to be registered as a voter, provided he has occupied the premises and paid the rates and taxes required. By attending to this act on the forthcoming revision of the lists of voters commencing from Monday next, compound householders will be saved a good deal of trouble, and numerous applications will be spared their claims.

THE LONGEST SHIP IN THE WORLD.—Messrs. C. Mare and Co., the ship-builders, of Orchard-yard, Blackwall, and Messrs. Penn, of Greenwich, engineers, have taken a contract to construct for the Peninsular and Oriental Steam Navigation Company, an iron steam-ship, of the following dimensions and power: viz. length between the perpendiculars, 325 feet; breadth of beam, 43 feet; depth, 32 feet. She will measure about 3000 tons, and will be propelled by four engines, of the collective working power of 1200 horses; will have feathering paid e-wheels, and a guaranteed average speed of 14 knots, equal to sixteen statute miles per hour. Some idea may be formed of the size of this gigantic vessel, when it is compared with that of some of the existing steam-ships most celebrated for their large size. She will be 51 feet longer than the *Great Britain*; 60 feet longer than the largest of the Cunard or North American mail-steamers, the *Asia* and *Africa*, 40 feet longer than the large steamers, such as the *Parana*, *Oronoco*, &c., now constructing for the Royal Mail Company, and 100 feet longer and 900 tons larger than the *Caledonia*, first rate, of 1st guns. She is the first of an improved class of steam-ships about to be constructed by the Peninsular and Oriental Company for the East India mail and passenger service, and it is confidently estimated that she will effect the passage between Southampton and Alexandria, a distance of 3100 miles, in nine days. The passenger accommodation in these vessels is to be on the most spacious scale, and replete with every comfort and convenience.

WRECK OF A SPANISH MERCHANTMAN.—The lugger *Nelson*, commanded by Joseph Ellis, with a crew of three picked boatmen, cruising in the neighbourhood of the Sunken Light, observed, about seven o'clock on Sunday morning, a flag of distress flying from a boat at some miles distance, and immediately put off to render assistance. On coming to sight they reached the boat, and found it to contain nine Spanish sailors, and to be in an almost sinking state, the stern being completely stove in. The unfortunate men having been taken off the *Nelson*, it was ascertained that they comprised the crew of the Spanish brig *Cervantes*, Captain Felix Loyo y Castro, from Christiansand to Barcelona, with a cargo of salt fish, which ran on shore on the Long Sands at half-past seven in the morning, the crew saved by their vessel sinking. Five o'clock in the morning, when, finding that their vessel was going to pieces, they took to the only boat left to them out of three, in which they remained, until they were picked up by the lugger, her boat at this time being about 24 miles from Margate, 6 from the Sunken Light, and 8 from the Kentish Knock. The rescued crew having been refreshed with hot coffee and other necessaries, were conveyed to Margate.

Lord Palmerston has resolved to send out Commander Forbes, late of the *Bo-tta*, on another mission to the King of Dahomey, with the view of securing his Majesty's co-operation in the suppression of the slave trade. Captain Forbes will proceed to the coast of Africa in the next mail packet to Sierra Leone, and during his mission the gallant officer is to be borne in the flag-ship *Penelope* as an additional commander.

THE LATE DUKE FERDINAND OF SAXE-COBURG.

DUKE FERDINAND GEORGE AUGUSTUS of Saxe-Coburg Gotha was the younger son of Francis, reigning Duke of Saxe-Coburg Gotha, was the brother of Ernest I., the succeeding reigning Duke, and was the uncle of Ernest II., the present reigning Duke. He was brother to the widow of the Grand Duke Constantine of Russia, to the Duchess of Kent, and to the King of the Belgians. He was uncle to her Majesty Queen Victoria, and to Prince Albert.

Duke Ferdinand George Augustus was born on the 28th of March, 1785. He was a military officer of distinction. He was a General of cavalry, and proprietor of the 8th Regiment of Hussars, in the service of Austria. The Duke married, on the 2d, January, 1816, Maria Antonette Gabriela, daughter and sole heiress of the late Francis Joseph, Prince of Kohary. By this alliance, the seigniory of Csabrag, the primitive seat of the Koharys, and the other lordships in Hungary and in Austria below the Ens, the possessions of the Kohary family, passed to Duke Ferdinand, and his residence was established at Vienna. The Duke had issue by the marriage two sons and a daughter. The eldest son is Ferdinand, present King of Portugal by his union with Queen Donna-Maria: the younger son, Prince Augustus, is the consort of the Princess Clementine, youngest daughter of the late King Louis Philippe. Duke Ferdinand's only daughter, the Princess Victoria, was married to Louis, Duke de Nemours, King Louis Philippe's second son. Duke Ferdinand, we regret to add, died on the 27th ult., in his 69th year.

THE LATE DUKE OF SAXE-COBURG AND GOTHA.—DRAWN BY HAUGNIET.

TOTAL LOSS OF THE "APOLLO," LONDON AND ROTTERDAM SCREW STEAMSHIP.

THE *Apollo* was an iron-built vessel; and in consequence of the rapidity and success of her trips, was deemed one of the finest "screws" that entered the Thames. She was between 500 and 600 tons burden, with engines of nearly 200-horse power, and was the joint property of the two companies. On Saturday forenoon, about 11 o'clock, she left Rotterdam for the Thames, with a heavy cargo of cattle and provisions. She had on board 17 passengers, amongst whom were three ladies. There were also five drovers, who had charge of the cattle; and her crew, including Mr. Smith, the master, the chief and second officers, engineers, &c., amounted to about 25, altogether on board numbering some 47 persons. Her live cargo consisted of about 160 head of cattle, and 800 or 900 sheep, and in the lower part of the hold was stowed a vast amount of provisions, butter, cheese, &c., the whole forming, as may be imagined, a very valuable freight. On the night setting in, the wind got up rather strong from the north-east. It was, however, favourable for the vessel's course, and she therefore had the advantage of both sails and screw. At midnight, when the watch was changed, the force of the wind had increased, with a very rough sea on. Onward, however, the *Apollo* went; and just before two o'clock in the morning, and whilst proceeding at the rate of twelve miles an hour, she struck on that formidable shoal to the Channel navigator known as the Kentish Knock, thirty or forty miles from the entrance of the Thames. About daybreak, a sloop connected with Dover observed the position of the *Apollo*, and having bore down, the passengers were taken on board, with such portions of their baggage as could be got at; and the sloop cruised about the spot, in order to rescue the master, Mr. Smith, and those who continued on board the wreck. The change of the tide altered the situation of the steamer;

THE LONDON AND ROTTERDAM SCREW STEAMER, "APOLLO."

and her front compartment being filled, it was quickly discovered that she was foundering. A rush was then made to the boat; and as the master and those who had continued with him were making for the sloop, the *Apollo* went down. This was between 7 and 8 A.M. The sloop then made for Dover, which she reached in the course of the evening, when the whole of those rescued from the *Apollo* were safely landed. Mr. Smith and his officers are represented to be very steady, careful navigators. The Dutch pilot was on board, but his duties were only confined to the difficulties of the Dutch coast; and it would seem that, on nearing or reaching the Thames, an English one is not generally employed until the vessel reaches Gravesend. The night is stated to have been exceedingly boisterous.

Since Tuesday last between 200 and 300 carcasses of sheep and lambs, part of the cargo of the *Apollo*, which were washed off the deck, have been picked up and brought into Ramsgate and Broadstairs. Many were washed on the sands near Ramsgate. On Monday evening several persons engaged to purchase carcasses at 1s. 6d. each. The following day they were employed in skinning and cutting up the carcasses. The skin and suet found ready purchasers among the tallow-melters and leather-cutters of the neighbourhood. The meat was forwarded to London. On Tuesday about 100 firkins of butter were recovered by the Margate, Broadstairs, and Ramsgate boatmen, and disposed of. The butter had not sustained damage.

ST. NICHOLAS CHURCH, ARUNDEL.

ST. NICHOLAS CHURCH, ARUNDEL.

THE Church of St. Nicholas, at Arundel, always attractive in its antiquarian associations, has just derived additional interest from being the *locus in quo*, the Duke of Norfolk "having left the communion of the Church of Rome, the hereditary faith of the noble house of Howard became a member of the Church of England." On Sunday week, the Duke and Duchess of Norfolk and Lady Adeliza Howard, the Earl of Ellesmere and Lord Brackley, attended the morning service at St. Nicholas. The Rev. G. A. Frederick Hart, one of the Chaplains in Ordinary to the Queen, preached the sermon.

The church is mostly built in the Perpendicular style, partly of flint and stone, in the form of a cross, from the intersection of which rises a low tower; the chancel has a north aisle, which contains several monuments of the former owners of Arundel Castle. The church belonged originally to a priory of Benedictines, subject to the Abbey of Seez in Normandy; but this priory was suppressed in the reign of Richard II., and a chantry, or college, for a master and 12 secular canons, with other officers, was founded in its place.

NOOKS AND CORNERS OF OLD ENGLAND.

THE WELL ON OCKLEY GREEN, SURREY.

ON the quiet village green of Ockley, in Surrey, stands this interesting memorial of true charity and self-denial. It is the good work of a lady who was many years governess in the family of a neighbouring gentleman; and knowing that the villagers were in want of a supply of pure water, she devoted the savings of her life to the remedy of this deficiency by sinking a deep well, and erecting over it the elegant pump and canopy which we have figured. But not only to relieve their bodily wants did she thus strive, but laid by sufficient to build a commodious school for the village children, which now adorns this naturally beautiful spot

THE WELL ON OCKLEY GREEN.

The water from the well is most abundant, and of excellent quality; and its value to the cottagers is well apparent, for it is seldom that many minutes elapse but some of them are seen crossing the green with a vessel to draw from the crystal fount. In its usefulness, this humble memorial contrasts favourably with the monument on Leith Hill, which appears in the background (when standing on the south side of the well), proudly lifting its comparatively useless head. The canopy of the well is supported by four Norman pillars of stone, the woodwork of the roof being of oak; and on a metal plate in front of the pump is the following inscription:—"The benevolent bequest of Jane Scott, A.D. 1837."

We have engraved this memorial as an example which we could wish to see more generally followed, and as an instance of what can be done even with the limited resources which a governess is generally supposed to have at her command. There are very many of our village greens, to which the formation of a like well and pump would be both an ornament and a blessing; for in numberless places the cottagers are obliged to resort for their sole supply of water to some unwholesome ditch or pond.

AUSTRALIAN EAGLES IN THE MENAGERIE OF THE ZOOLOGICAL SOCIETY, REGENT'S PARK.—(SEE NEXT PAGE.)

ANNIVERSARY FETE OF THE MORFE COTTAGE GARDEN SOCIETY, AT DUDMASTON, NEAR BRIDGNORTH, SALOP.—THE MANSION AND PART OF FLOWER-GARDEN.—(SEE NEXT PAGE.)

THE MORFE COTTAGE GARDEN SOCIETY, BRIDGNORTH, SALOP.

THIS society held its fifth annual show at Dudmaston, the beautiful seat of W. W. Whitmore, Esq., near Bridgnorth, on Thursday, the 28th August.

The association was formed in the year 1847, under the patronage of T. C. Whitmore, Esq., M.P., Apley Park; W. W. Whitmore, Esq., Dudmaston; R. H. Cheney, Esq., Badger Hall; and W. S. Davenport, Esq., Davenport (who kindly agreed to allow the society to hold its exhibitions alternately in their delightful grounds), for the benefit of cottagers and garden labourers residing in their immediate vicinity, and who are thus encouraged, by the distribution of prizes for the best production of vegetables they would otherwise have to dispose to the greatest advantage the small plots of ground attached to the cottages. Rewards, also, are distributed for the neatest and best stocked gardens. The result of the society's efforts is proved in the present object of the yearly show. Those of the labouring classes who are members have been practically convinced, by the reception of prizes, of the solid advantages which can be reaped from a bestowal of only common pains and industry upon their little gardens; whilst the unsuccessful competitors have, at least, the satisfaction of knowing, that, by their endeavour to succeed, their homesteads have produced a greater variety of vegetables for their frugal meal than they would otherwise have done.

Three spacious tents, one for the cottagers, another for the garden labourers, and a third for the specimens of fruits, vegetables, and flowers of the honorary members, who contend for the principal prizes, were erected in a beautiful knoll within the Park, which commands a lovely home view, combining a rich diversity of wood, rock, hill, valley, and water.

The grounds were thrown open to the public at twelve o'clock, and thousands availed themselves of this opportunity of spending a happy day in a rational and social manner. Here might be seen the landlord and steward, the master and servant, the rich and poor, meeting together for innocent recreation, whilst the familiar and hearty salutation of the former, and the cheerful smile of the latter, evinced the heartfelt pleasure he experienced in the sympathetic look and friendly greeting of his superior.

The boys of the blue-coat school, of the union school, Bridgnorth, and of the parochial schools, 150 in number, headed by their merry little band of fifes and drums, opened the exhibition, by marching round the tents.

At five o'clock the President addressed the company, and in an able speech set forth the advantages which such a society must ever have in promoting the morality, comfort, and industry of the cottagers, and the kindly feeling which such an annual re-unhage regenderal among all classes of people. He also stated this gratifying fact, that, during the four years of the society's existence, not the slightest damage had been done to the parks and pleasure-grounds in which the exhibitions were held, proving the beneficial effects which education and civilisation had effected in the minds and habits of the great masses of the people. After which he proceeded to distribute the prizes.

Many of the poor received from 1s. to 5s., and all seemed satisfied with the fairness of the awards. An efficient band enlivened the scene, and ample refreshment were provided.

AUSTRALIAN EAGLES IN THEIR NEW AVIARY,

AT THE GARDENS OF THE ZOOLOGICAL SOCIETY, REGENT'S PARK.

AMONG the new buildings of the Zoological Society is an aviary expressly designed for the collection of eagles. The picturesque manner in which the birds display themselves is well expressed in our Illustration, and entirely contrary to the advantage which always results from placing animals in confinement under natural circumstances. The collection of eagles, which was formerly scattered in obscure and inappropriate dens, has gained much in effect by being brought together into one great group, while the space which is afforded to the different species presents them in a far more favourable manner to the observation of the visitors. We would, for instance, direct attention particularly to a point of view at the western end of the aviary, where the spectator obtains a *coup d'œil* of the whole southern front of the building, with its cleverly-modelled masses of rock covered with five of the finest species of rapacious birds which exist. The Condor of the Andes, the Golden Eagle, the Wedge-tailed Australian Eagle, the Sea Eagle of Europe, and the Bald Eagle of America crown the different points, and not unfrequently utter their wild cries and spread their wings to the wind, as if they were still in their native fastnesses.

The building has two fronts, each about ninety feet in length. The northern side contains ten divisions of smaller dimensions than those to which we have alluded, and they are devoted to rarer species, which are also, generally, of less imposing size. Among these we have the Imperial Eagle of Austria and Hungary, the Fisher Eagle of the Cape, the Chilian Eagle, the Fisher Eagle of Australia, King Vultures, and other interesting forms, which admirably illustrate the larger genera of rapacious birds. It is to be regretted that the Lammergeier should not there to complete the magnificent series of vultures, in which, with that exception, the Society's collection is complete. The arrangement of the iron-work in this building deserves notice from the subordinate part which it has been made to take in that of displaying the birds. It is scarcely possible to have had equal strength with so little interruption to the sight.

As there is no institution in London which has made so remarkable a progress within the last few years as the menagerie of the Zoological Society, it is gratifying to find that the public fully appreciate the interesting succession of improvements which have stamped it with the vigorous character which it now bears.

The number of visitors was greatly swelled by those at the Great Exhibition, and when that no longer exists there is very little doubt that the gardens of the Zoological Society will be without a rival in popularity.

The impression produced upon foreigners appears to be still more favourable than our own, if we take the visitors' book at least as a measure of the whole. Between 13,000 and 14,000 persons passed through the gates on that day, and penetrated with eager interest to every nook and corner in which an animal or a flower was to be seen.

The extensive usefulness of the Society's establishment appears to give an extraordinary impulse to the accession of donations, for we find, in looking over the monthly reports with which the Fellows are furnished, that scarcely a week passes without some valuable addition being made to the collection in this manner. We willingly direct the attention of our readers abroad to the careful appreciation which is bestowed by the Society upon the many gifts which have within the last two years been successfully transmitted to them from the most remote countries, and by the most distinguished persons. Any traveller, any captain of a vessel, may, if he chooses, give invaluable assistance to the Society in a number of species contained in this great collection, with very little exertion on his own part during the homeward voyage to England, from whatever port he may start.

Among the most recent arrivals in the menagerie are some interesting reptiles from Berbice, transmitted by Mr. Strutt, stipendiary magistrate; and from Morocco, brought home by Mr. Oxborough; some Mandarin ducks, obtained in China, by the influence of Dr. Bowring; and a valuable bear from the Euphrates, which was brought in the *Hertford*, with the late Nineveh sculptures from Bassorah, and has been presented to the Society by Mr. Alderman Finnis.

DISCOVERY OF EXTENSIVE FORGERIES.—A few months ago, Mr. Henry Edward Fidgway, solicitor, Norfolk-street, Manchester, a gentleman of long and extensive practice, highly respected, and in whom great confidence has evidently been reposed by numerous clients, died. Everything has transpired within the last ten days which have led to the belief (legal proof has not yet been produced) that he had, for about two years prior to his death, availed himself of the circumstance of the deeds of his clients being left in his safe and possession for security from fire, &c., and employed those deeds as a means of realising money. It is said to be now ascertained that he had forged mortgage deeds for various sums, and, unknown, of course, to his principals, had handed over these documents, which had for years been left in his custody. Having received the money on the mortgages thus effected, he paid the interest himself; consequently, during his lifetime no suspicion was excited. The interest was one case recently falling due, and not being paid as heretofore, the principal was applied to, and he, surprised, of course, at the application, denied that he had ever effected such a mortgage, or was at all cognizant of it—the signature of the mortgagee deed was forged. Other discoveries have been made, and it is feared there are some still undiscovered. Already the sums thus obtained on mortgages are believed to exceed £10,000, which must entail a serious loss to the parties who have advanced the money. Legal proof of the forgeries, of course, has yet to be adduced.

THE SIOUX INDIANS.—The *New York Tribune* of the 25th ult. contains a report of an interview of the United States Commissioners with the chiefs of the Sioux Indians, the object of which was to conclude a treaty for the purchase of their lands. The Indians struggled hard to obtain the payment of an annuity in advance of 20 000 dollars before the ratification, and in the treaty but eventually they were contented with an engagement on the part of the United States Commissioners, that the matter should be immediately attended to. The treaty provides that—"There be perpetual peace between the Indians and the United States: that they cede all of their lands, but have a reservation for a home; that the United States pay them a sum of 1,410,000 dollars; that the chiefs receive 270 000 dollars on the ratification of the treaty; that they receive 30,000 dollars for the establishment of school-houses and other buildings; that the remaining sums remain in trust with the United States at five per cent. interest for forty-two years, and that the principal then revert to the United States. That they receive the following annuities:—12,000 dollars agricultural Fund; 8000 dollars Educational Fund; 10,000 dollars in goods and provisions; 20,000 dollars in cash. The money left to be expended by the provisions of a former treaty at the discretion of the President, is by this made payable in cash.

THE THEATRES, &c.

HER MAJESTY'S.

The brilliant houses which followed the return of Madame Sontag, on the 5th and 6th inst., after her engagements at the provinces compelled the management to organise five additional performances, at pay-house prices, for the week, beginning on Tuesday with "Il Barbiére," in which Signor Montelli appeared as *Dr. Bartolo*: on Wednesday the first act of Norma, selections from "Der Freyschütz" by Mdme. Fiorentini and Pardini, the last act of "Otello," with Madame Sontag and Pardini, the last scene of "Anna Bolena" for Barbieri Nini, and dancing by Rosati, were the programme: on Thursday night, Bellini's "Sonnambula," with selections from "Lucia" and "Linda," were the entertainments. Last night and this evening (Saturday), announced as positively the concluding representations, the programmes comprise divers gleanings from operas for Madame Sontag, Mdlle. Cruvelli, Mdme. Barbieri Nini, Mdme. Fiorentini, Signor Calzolari, Pardini, Balanchi, and Lorenzo.

There have been 102 performances this season; namely, 46 subscription nights, 52 extra representations, three morning concerts, and one *soirée* for the Spanish Dancers. The revivals have been, "Don Giovanni" and "Nozze di Figaro," of Mozart; "Lucia," "Elisir d'Amore," "Lucrezia Borgia," "La Figlia del Reggimento," "Don Pasquale," "Linda," and "Anna Bolena," of Donizetti; "Il Barbiére," "La Cenerentola," and "La Gazza Ladra," of Rossini, "Sonnambula" and "Norma" of Bellini, "Ernani" of Verdi, and "La Prova" of Greco (16 operas). The novelties have been "Ghitave," "La Muta di Portici" ("Masaniello"), "Il Prodigo," and "Zerlina," of Auber; "Le Tre Nozze" of Alary, "I Quattro Fratelli" of Balfe, "Foriosa" of Thalberg, and "Fidelio" of Beethoven (3 new operas). Thus, the catalogue presents a total of 24 lyric dramas, sustained by Madame Sontag, Mdlle. Caroline Duprez, Madame Ugalde, Madame Giuliani, Madame Fiorentini, Mdlle. Alayno, Mdlle. Keller, Madame Grimaldi, Mdlle. Nau, Mdlle. Fischer, Mdlle. Lanza, Mdlle. Sophie Cruvelli, Mdlle. Marie Cruvelli, Mdlle. Ida Bertrand, Mdlle. Alboni, and Madame Barbieri Nini; Signori Gardoni, Calzolari, Bonfi, Dat Fiori, Marcurial, Ronsegni, M. Poublier, and Mr. Sims Reeves (tenors); Signori Lablache, Coletti, F. Lablache, Lorenzo, Balanchi, Ferranti, Casanova, Scapini, Montelli, and M. Massol (bass and baritone). The ballet has included Carlotta Grisi, Cerito, Rosati, Ferraris, Maria Taglioni, Petit Stephan, MM. Paul Taglioni, Silvain, Charles, Ehrick, Gosselin, and the inimitable mime, Mdlle. Monti. The new ballets and divertisements were "L'Ile des Amours," and "Les Compagnons," and the revivals "Les Metamorphoses," "Le Diable à Quatre," "La Sylphide," "Ondine," "Les Graces," and "Esmeralda," besides the Spanish dancers. The celebrated violinist, Sivori, was engaged in the engagements.

The above enumeration of the labours of this memorable season will afford a notion of the enormous exertions and spirited engagements made by the management for the year of the Exhibition. For more than half the season the performances were five nights in the week. The works which were given twenty-two times, that of Beethoven eleven times, those of Mozart seven times, that of Thalberg six times, those of the modern Italian school about fifty times. These numbers are suggestive, as they indicate that the taste of the subscribers and of the general public lean more to the purely Italian style than to that of the French and German masters.

It is much to be regretted, that the loss of this memorable season will afford a notion of the enormous exertions and spirited engagements made by the management for the year of the Exhibition. For more than half the season the performances were five nights in the week. The works which were given twenty-two times, that of Beethoven eleven times, those of Mozart seven times, that of Thalberg six times, those of the modern Italian school about fifty times. These numbers are suggestive, as they indicate that the taste of the subscribers and of the general public lean more to the purely Italian style than to that of the French and German masters.

It is much to be regretted, that the great event of the season, the *début* of the gifted Barbieri Nini, one of the greatest lyric *artistes* of this age, should have taken place so late in the season. With Madame Sontag in the parts in which Mdme. Barbieri Nini appeared, as the Barbiére Nini is the highest dramatic charaters, and with Alboni as a contralto solely, a truly great triad would have been secured. In the second rank, Mdlle. Cruvelli, Mdlle. Alayno, and Madame Fiorentini, may be enrolled as singers requiring study and experience to occupy the first position. Mdlle. Dupres is a thoroughly accomplished vocalist, but her powers are better adapted to the Opéra Comique, which, by the way, Mdme. Ugalde evidently made a mistake in leaving for the Italian Opera. Of the new tenors and bassos, there is nothing to record. Massol won the public in "Il Prodigo" and *Pietro*, but a working baritone for the *Figaro* and *Don Giovanni* line was wanting.

Mr. Balfe has achieved marvels this campaign, and the acquisition of Mr. Harris for the *mise en scène* has been invaluable.

HAYMARKET.

The new comic drama of "Grandmother Grizzle," produced on Wednesday, is taken from M. Bérenger's song, "Ma Grand'mère," the ditto sung through a French vaudeville, "La Dentelle de Brienne," and then restored to more than its original consistency by Mr. Buckstone for solid English use. The part originally performed by Mdlle. Déjazet is, at this theatre, undertaken by Mr. Fitzwilliam, who makes up and enacts the quarrelsome old lady to the life. Nor is she less admirable, when, partaking of the generous wine which she has stored for nearly sixty years, she slows off the cares of decay, and recounts the amours of her youth. Having enacted this scene, Mrs. Fitzwilliam instantly reappears as *Little Steve*, grandson to the old lady, and rattles off a scene of rollicking fun in most effective style. Mr. Buckstone himself assumes the character of *Jeremy Puddle*, a drunken butler, wondering at his mistress's conduct and change of mood. To make up a story, there are also some subordinate incidents, which, by extending the piece to unnecessary length, impede the progress of real success. The *one* character is the real feature; and when this becomes understood by the audience, we have no doubt of the little drama thoroughly prospering.

SADLER'S WELLS.

It is not often that we get a comedy well cast at this theatre; but the late additions to the company have enabled "The Road to Ruin" to be placed on its stage with more than ordinary completeness and effect. Mr. Barrett as *Old Dornton*, Mr. Marston as *Harry Dornton*, Mr. Hoskins as *Goldfinch*, Mr. Ray as *Silky*, and Mrs. H. Marston as *Widow Warren*, present a satisfactory *ensemble*. The last character was performed as none save Mrs. Glover and its present representative could perform it. Mrs. Marston must needs increase her already high reputation by her admirable impersonation. Mr. Ray, as usual, proved himself an expeditious artist; and Mr. Barrett was broad and pathetic in his delineation of a character which always carries the sympathies of an English audience.

ADELPHI.

The subject of "The Man in the Iron Mask" having been taken for the theme of a French opera, the libretto of the latter has been adroitly enough turned into an Adelphi melodrama; but not more adroitly than the story itself has been turned into a pay of any kind. Forty years' imprisonment in an iron mask was, *à priori*, no tempting argument for the stage—rather, it were a theme for a Dickensian episode in some new Pyrgatorio; but the French playwright disposes of the difficulty by substituting for the ill-used and miserable victim, who puts it on his own face, by way of atonement for an early sin, and to secure his daughter's happiness. Mr. Webster, who has recovered from a serious indisposition, impersonates the self-devoted chevalier *De Rosarges*, the father of *Aline* (Miss Fitzwilliam), who is betrothed to *Roland* a farmer (Madame Celeste). The happiness of this worthy is smoothed by *De Rosarges*, who is an agent of Mazarin, and by the *Countess de Chevreuse* (Miss Woolgar); and the result is that his farm is destroyed by an incendiary fire, whence the young man is parted from *Aline*, and introduced into court, where he has mysterious interviews with the *Countess*, who in rustic is none other than an unacknowledgeable son of *Anne of Austria*, wife to *Louis XIII.* The *Queen Mother* is compelled to satisfy herself with furtive glances of her offspring, until the fatal moment arrives, when, previous to the interview, the wandering youth is seized by the *Chevalier*, being condemned to perpetual imprisonment and the iron mask. From this gloomy fate, however, *Roland* is far from *Roland* to be happy with his daughter in. The character is such as exactly suits Mr. Webster: in its rude strength, the pathos of its remorse, and its external profit gusy. Madame Celeste, as the despairing *ingenuous*, was exceedingly effective; and Miss Woolgar, as the *Countess*, conducting a serious purpose with an apparent levity of manner, had a part which ensured a special triumph.

On Saturday week Mdme. Celeste will leave England for America, and be absent for some months.

OLYMPIC.

"I have Eaten my Friend" is the name of a farce written for the display of Mr. Compton's powers of pun. It is founded on the anecdote of the French barber who cut the throats of his patients, and sold them to a confederate peeman next door. Mr. Compton, as *Mr. Jellytop*, finds the button of one of his friends in his pie, and then imagines all the preceding horrors. The humour of such a piece is of the roughest, and the flavour of it proved somewhat too strong for modern taste.

ST. JAMES'S.

The Bateman children have this week added *Lady Macbeth* and her overtempted Lord to their *répertoire*. The same marks of elaborate training are apparent, and produced to the same point of stage effect. Such pupils are a credit to their teacher.

** In our account last week of the American Dramatic *Fête* in New York, we stated that the sum of 2000 dollars was realised; we find that the receipts were, in fact, between 4000 and 5000 dollars.

A theatrical commission, nominated some time ago by the King of Holland, to inquire into the state of the theatrical art in that country, has presented a report to his Majesty, recommending that for the future the theatres shall not be conducted private speculators, but be entrusted to each one to a competent director, with a fixed salary, shall be appointed; that care shall be taken in the choice of pieces; that authors shall be duly encouraged, that performers shall be fairly rewarded; that losses shall be borne by the state; that the prices of admission shall be such as to suit every purse; and so on. The King, who takes peculiar interest in theatrical matters, is, it is said, disposed to agree to all this.

DRURY-LANE.—Mr. Risley, the director of the present popular entertainments at this theatre, has announced his benefit for Monday next, when there will be an entire change of performance, and several novelties in the *manége* will be introduced.

MUSIC.

TESTIMONIAL TO MR. BALFE.—On Saturday, the 6th instant, at the St. Alban's Hotel, Charles-street, Haymarket, the gentlemen of the orchestra of Her Majesty's Theatre, assembled, with their leader, M. Tolbecque, to present to Mr. Balfe, the musical director and conductor, a handsome silver salver, weighing about eighty ounces, of the value of £40, from the house of Storr and Mortimer. On the testimonial was inscribed, "To the celebrated and popular composer, Michael William Balfe, Esq., by the gentlemen of his orchestra of the present remarkable season of her Majesty's Theatre, 1851." Mr. Oury (treasurer) was in the chair, and referred to the nineteen operas composed by Mr. Balfe, many of which, and especially "I Quattro Frate li," had been produced in four languages, and in every country under his management and conservation for the members of the band, as in every way entitling him to the testimonial. Mr. Balfe's health having been drunk with the highest enthusiasm, he returned thanks, warmly eulogising the unparalleled exertions of the orchestra during the season, in the execution of 34 operas, of which eight were novelties.

ENGLISH OPERA AT THE SURREY THEATRE.—This undertaking has been entirely successful; the boxes have been crowded to excess, almost every evening, for some months past; and the managers have resolved to maintain their company as long as public patronage is so decided. An English version of Donizetti's "Linda," for Miss Romer, Miss Poole, Mr Travers, and Mr. Borrani is in preparation.

ENGLISH OPERA AT DRURY-LANE THEATRE.—Mr. Bunn, the new lessee, is actively engaged in preparing for his campaign, which will begin at Christmas; one of the earliest novelties will be a new opera by Mr. Balfe

JULLIEN'S PROMENADE CONCERTS.—These popular entertainments will take place at Drury-Lane Theatre, as usual, at the close of October or beginning of November, up to a week before Christmas.

ORCHESTRAL SOCIETY.—The first annual series of concerts will be commenced at St. Martin's Hall, on the 17th of November.

M. OROSZ AND HERR HENNEN.—These pianists have commenced their tour in the provinces to acquire fame and profit: the former had an evening concert on the 3d, at the Mechanics'-institute, Sunderland, assisted by M. Remenyi (violin), Mr. H. Blagrove, Herr Lutgen, Miss Hermanns, and Miss Binckes. The latter had an evening concert on Monday last, at St. Martin's Lane, his programme including the names of Mrs. A. Newton, Mr. Poole, Mr. R. Frodsham, Herr Formes, Herr F. Hennen (violin), Mr. Richardson, and Signor Piatti, with a full orchestra.

GRAND OPERA IN PARIS.—Mdlle. Alboni has made her reappearance in the character of *Fidès*, at the 105th representation of Meyerbeer's "Prophète." Mdme. Viardot having engaged to sing at the Covent Garden Royal Italian Opera during the months of May and June 1852, and having entered into engagements for Germany in the spring, her contract with the Parisian Grand Opera has been broken by consent with the Director; but she is to reappear at the period of the production of Meyerbeer's new five act opera, the composer having stipulated expressly for her creation of a new part in one of his three finished productions. Halévy's "Juif Errant," for Mdlle. Lagrua (of Dresden), Mdlle. Nau, Massol, is in active preparation.

ITALIAN OPERA IN PARIS.—The season will begin in October. Herr Ferdinand Hiller, directory of the Conservatory, and Chapel Master at Cologne, has been appointed by Mr. Lumley, musical director.

WARSAW.—A new opera by Ricci, "Rolla," has been produced at the Italian Opera in Warsaw.

NAVAL AND MILITARY INTELLIGENCE.

Forty additional hands have been put to work on board the *Agamemnon*, 90-gun steam screw-ship, building at Woolwich dockyard, and there are now 170 workmen employed in accelerating the construction of that vessel.

The Admiralty have at length disposed of one of the old superannuated squadron of steamers. She is the *Dotterel*, one of the old Portpatrick packets. She has been disposed of for about £1800.

NUMBER OF GENERAL OFFICERS.—Up to the 4th inst., the following was the number of general officers in existence:—Five Field-Marshals, 26 Generals, 94 Lieutenant-Generals, and 149 Major-Generals: total, 283. Of these, 134 are Colonels of regiments or battalions, and 1 Field-Marshal, 7 Lieutenant-Generals, and 30 Major-Generals are actively employed.

Commodore Seymour has been appointed superintendent of the dockyard at Devonport, in the room of Admiral Lord John Hay, deceased.

THE ORDER OF THE THISTLE.—It is said that Lieut.-General Lord Saltoun, the Colonel of the 3d Queen's Royals, is to succeed the late Viscount Melville as a Knight of the Thistle.

THE TROOPS IN LONDON AND ITS VICINITY.—The following are the numbers of the different regiments now doing duty in the metropolis and its vicinity:—Household Brigade, who this week go into quarters for the ensuing month next year—Cavalry, 1st Regiment of Life Guards, Albany Barracks, Regent's-park; 2nd ditto, Knightsbridge Barracks, Hyde-park; Royal Horse Guards, Blue, Parade, St. James's-park; 1st Dragoon Guards, Knightsbridge Barracks, Hyde-park; 2nd ditto, St. John's-wood Barracks, Regent's-park; Royal Horse Artillery, ditto Engineers, Sappers and Miners, and Royal Marines (1st Division), Woolwich. Infantry—1st Battalion Grenadier Guards, Wellington Barracks, Birdcage-walk; 2nd ditto, St. John's-wood Barracks, Regent's-park; 1st Royal Artillery, ditto Engineers, Sappers and Miners, and Royal Marines (1st Division), Woolwich. Infantry—1st Battalion Grenadier Guards, Wellington Barracks, Birdcage-walk; 2nd ditto, St. John's-wood Barracks, Regent's-park; 1st Royal Artillery, ditto Engineers, Sappers and Miners, and Royal Marines (1st Division), Woolwich. The

STUPENDOUS GROUP OF SPOTS ON THE SUN'S DISC.

On looking at the sun this (Thursday) afternoon, I was greatly struck with the enormous magnitude of a group of spots near the western limb, and below his equator. The group consists of an extremely large oval spot, with a well defined fringe or penumbra, and several smaller ones, in the form of a parallelogram, with the longer side disposed upwards. Between three and four P.M., I obtained the following measurements with the equatorial and filar-micrometer, charged with a lens magnifying forty-five times:—

THE GROUP.

Vertical Measures. Rev.	Fts.	Dec.	Transverse Measures. Rev.	Fts.	Dec.
4	63	5	3	93	7
4	63	0	3	93	7
4	63	0	3	93	4
4	64	6			
4	64	3			

Means: 4 64 2=136·149"=2' 16 15" 3 93 6=115·442"=1' 55 442"

THE LARGE COMPONENT.

Vertical Rev.	Fts.	Dec.	Transverse. Rev.	Fts.	Dec.
0	94	3	0	53	6
0	94	3	0	53	5
			0	53	6

Mean: 0 94 1=27 59·3" Mean: 0 54 5=15 984"

Sun's polar diameter at noon, 31' 46·8" = 1906·8"

The length of the group in the direction of the sun's axis is about 63,000 miles, and the width parallel to the equator 53,000 miles: the former being about 1-14th, and the latter nearly 1-16th of the sun's true mean diameter, which is 883,000 miles. Moreover, the space occupied by the patch would permit to pass through it a globe nearly as ten times as large as our earth, while in a vertical direction it exceeds the diameter of our planet by eight-fold, or 56,147 miles. The large spot, which is the nearest to the western limb, exceeds, vertically, the terrestrial diameter by 48'2" miles, and its breadth been greater by 900 miles, the opening between sufficiently large to admit through it a body equal in magnitude to the earth.*

I endeavoured, but without success, to detect the group on the solar disc with the naked eye, reduced by a series of stained glass; and it may here be well to remind those who incline to look out for the patch, that it is rapidly approaching the western limb, and will pass behind it in a few days. So extensive a vacuity in the sun's luminous envelope must, unquestionably, diminish the amount of solar heat radiated to the earth: the loss, however, in this instance, is rendered insensible, either by current from a lower and warmer latitude, by terrestrial radiation, or by the conjoint aid action of these or other meteoric-olezial phenomena, for the temperature for some days past has been several degrees above the average for the season, as shown below:—

	In the Shade. Maximum.		Minimum.	In Sun's Rays.	Rain.
Sept. 1	64°	..	53°	70° ..	0·148 in.
2	67·5	..	50	97 ..	0·206
3	68·5	..	48·5	98	
4	69·5	..	53	92	

To those who have never heard any cause assigned for the production of the solar maculæ, it may be interesting to learn that astronomers have now almost universally adopted the theory of the late Dr. Wilson, suggested in a paper read to the Royal Society in the year 1775. The sun is regarded as a black solid nucleus, surrounded by two atmospheres—one somewhat resembling our own, and the other highly luminous. Vast currents are, doubtless, propagated in these atmospheres, whereby parts of vacuums or openings are produced, and, in the case of a spot, the luminous envelope invariably surrounds it: in the inner and obscure gaseous envelope, and the black centre the solid body of the sun, seen through the attenuated media.

J. F. MILLER.

The Observatory, Whitehaven, 8th Month 4, 1851.

COMMUNICATION BETWEEN ENGLAND AND IRELAND, VIA CHESTER AND HOLYHEAD.

The intercommunication of the two countries has been vastly facilitated by the booking-through and return-ticket system lately carried out by the Chester and Holyhead Railway Company. This system between England and Ireland has been in operation since the first of August, but during that month it only extended between London, Birmingham, Manchester, Liverpool, and Chester, on the one hand, and Dublin on the other. It is now carried out between those towns in England, and Dublin, Cork, Limerick, Kilkenny, Galway, Belmullet, Athlone, Mullingar, Belfast, and Downdalk. Passengers are also booked to or from Kingstown and Crewe, Warrington, Leeds, Huddersfield, and Bangor. The return-ticket system enables a party travelling between London and Dublin to take places there and back and be absent a fortnight; and the price of these tickets is usually a single fare and a half; but in some cases it is even lower. Passengers get to Dublin by express trains in 13½ hours, and three save largely upon the Liverpool route. The distance between London and Dublin is 463 miles; so that a passenger taking a return ticket travels 666 miles, first class express, for £4 10s., or at the rate of about 1½d. per 100 miles, including boats. Second class passengers are charged at the proportion of one-third less. The single fare from London to Galway, first class, is £3 10s., and £2 12s. second class; return tickets are £5 18s. first class, and £4 second class. The single fare to Cork is £3 8s. first class, and £2 8s. second; and return tickets £4 17s. 6d. first class, and £3 9s. second. The first class fare to Belfast is £3 10s., second class is, £2 10s.; return ticket, £5 5s. first class, £3 18s. second.

The principal Irish railways which have associated themselves with the Chester and Holyhead Company in this new extension of railway communication, are the Great Southern and Western, between Dublin and Cork; the Midland Great Western, between Dublin and Galway; the Dublin and Drogheda, the Belfast Junction, and the Irish South-Eastern. When the Killarney Junction Railway is formed from Mallow to Killarney, the railway communication between Dublin and the Lakes will be complete. Railway accommodation will also be afforded between Dublin and Wicklow in the course of the next eighteen months, and the line will traverse Bray and other interesting scenery in the county of Wicklow. The through railway communication between Dublin and Belfast will be completed in January next, with the exception of the Boyne viaduct, which will not be finished until 1853. It may here be stated that the same system of booking between England and the places we have enumerated on the other side of the Channel will be applied to goods as well as passengers.

The English tourist will naturally seek Killarney. The medium of communication for the greater part of the distance is the Great Southern and Western Railway (the best construction and best managed line throughout Ireland), which will take him to Cork, if he prefers first to see the Lakes from the Kenmare-road; or to Mallow, if he chooses to go direct to Killarney. By adopting the former course, he will be enabled to visit Cork and Queenstown; and by pursuing that route, Bantry Bay and the magnificent scenery of Glengariff will also be brought within his view. By the Midland Great Western Railway he reaches Galway, whose bay has recently been the subject of so much competition.

As the through-fare and return-ticket system has been fully in operation since the 1st September, the effect upon the traffic generally has not yet been ascertained, but it may be mentioned as an instance of the augmented traffic which must have taken place since the partial adoption of the scheme on the 1st August, that the daily number of passengers by the Chester and Holyhead boat-trains, both ways, was, in the month of August, 1850, only fifty, it last month averaged one hundred and eighty—an excess partly owing, no doubt, to the attraction of the Great Exhibition, but showing, nevertheless, a large accession of traffic.

PROVIDENTIAL ESCAPE.—A singular accident occurred a few days ago at Hoyle-mill Colliery, the property of Earl Fitzwilliam, about five miles south of Barnsley. Shortly after the men had commenced working on Tuesday morning, one of the miners fired a shot for the purpose of felling some coal. Soon afterwards the fillers came to the spot, and commenced to clear away the fire by "wafling" their caps and pockets, which had the effect of driving the sulphureted air to the burning mass, which soon increased the fury of the fire so much that the men considered it dangerous to continue in the pit. They therefore ascended the shaft; and shortly after they arrived at the top the mass burned with such vehemence as soon to blaze and rear like a furnace. They then made a stage at the mouth of the pit, for the purpose of extinguishing the fire, by preventing any air getting to it. This business occupied the men near an hour. While this employed, the signal-bell rang. This the men thought was occasioned by the material which they were putting down to close the mouth of the pit having fallen against the bell-wire, being confident no one was in the pit. They again resumed their labours, and had been at them some time, when the bell again rang. They the a looked round the pit hill, and found that one man was not amongst them. Some were positive they had seen him on the hill with the rest of them; others confident it was then agreed that a messenger should be sent to his residence, to see if he was there. The man was accordingly sent, and a quarter from the pit, some time elapsed ere the messenger returned, during which time the men stopped putting more material down the shaft. However, the bell rang more violently than before; and, by the advice of the engine-tender, one man was taken up again, and a cover put into the chair, and lowered to the bottom of the shaft; and when drawn up again, it was found to contain the missing man and two boys, who had been buried in the burning pit above an hour, and brought out unhurt. The horses and an ass perished. It appears the man and boys, although present when the others were endeavouring to extinguish the fire, thought there was no danger; they therefore went to their work in another part of the mine, and commenced their labours, not knowing but the others had done the same, until they found the air bad. At seven o'clock the pit remained on fire, and will be closed for some time.

Intelligence from Durban, Natal, has been announced that the Prince de Metternich is so unwell as not to be able to leave his room. This state causes some uneasiness, particularly when it is remembered that he is now in his 79th year.

* The measurements of the large or principal include the penumbra, which is very sharply defined.

NATIONAL SPORTS.

Everything in the shape of racing gives way next week to the grand annual reunion at Doncaster, where, commencing on Tuesday, we may look for four days' fair average sport. The Yorkshire Handicap will be the feature of the first day; the St. Leger, of the second; and the Cup, of the last; the third being chiefly devoted to the settling. Should Nancy and Teddington meet for the Cup, it will create an interest scarcely inferior to the St Leger. To enable the London devotees of the turf to participate in the sport, the Great Northern Railway have announced special express trains from King's-cross on Monday, Tuesday, Wednesday, and Friday, returnable up to Saturday morning at single fares. They have also determined to afford similar accommodation throughout their system.

REGATTAS.—Dover on Monday, Bermondsey on Tuesday, and the Royal London Yacht Club Challenge Cup on Saturday.

The Gentlemen are confined to a match at Edinburgh on Monday, and at Glasgow on Thursday. The season is rapidly drawing to a close.

TATTERSALL'S.

MONDAY.—The room was very well attended this afternoon, and more than the average amount of business was transacted at the under-mentioned prices.

RADCLIFFE RACES.—MONDAY.

The HEATON PARK STAKES of 5 sovs each, with 25 added.—Mr. J. Osborne's Equal (Carrol), 1. Mr. Watters's Maid of Team Valley (M. Noble), 2.

The WILTON CUP of 100 sovs, added to a Handicap of 15 sovs.—Lord Wilton's Herbert (Ast e), 1. Mr. M. Charlton nd. Mary Nobbler (Osborne), 2.

The TWO-YEAR-OLD STAKES of 5 sovs each, and 30 added.—Mr. J. Osborne's Merry Bird (W. Abdale), 1. Mr. Jones's Travestie (Dickinson), 2.

TUESDAY.

STEWARD'S CUP of £40, added to a handicap of 5 sovs.—Mr. Walter's Maid of Team Valley (M. Noble), 1. Mr. W. Holford's Worcester (Carrol), 2.

ST. LEGER STAKES of 5 sovs each, and 25 added.—Mr. Shepherd's Labyrinth (Charlton), 1. Mr. Osborne's Cheap John (Osborne), 3.

FERN HANDICAP of 5 sovs each, and 25 added.—Mr. Pedley's Paquetta (Hayhoe), 1. Mr. F. Parr's Vancouver colt, 2.

WEDNESDAY

MANCHESTER CUP of £50, added to a handicap of 10 sovs each.—Mr. G. Barton's Little Fawn, 1. Mr. Edwards's England's Glory, 2.

BURY PURSE of 5 sovs each, with 30 added.—Mr. Inman's Maid of Lincoln, 1. Mr. John Osborne's Merry Bird, 2.

The SCURRY STAKES were won by Equal.

LICHFIELD RACES.—MONDAY.

The PRODUCE STAKES of 10 sovs each.—Mr. Mostyn's Princess Alice f. (White), 1. Mr. Copeland's Candlewick (Chiids), 2.

The STAFFORDSHIRE STAKES of 10 sovs each.—Mr. Copeland's Candlewick (Childs), 1. Mr. Mott nd Goldfinder, 2.

The TWO-YEAR-OLD STAKES of 10 sovs each.—Mr. Merry's Ithuriel f. (Marlow), 1. Mr. Eykes's My Fancy (Sharp), 2.

The SELLING STAKES of 5 sovs each.—Mr. Scott's Taly (W. Sharpe), 1. Mr. Brown's Tiny, 2.

TUESDAY.

The GOLD CUP of 50 sovs.—Mr. Austin's Miss Julia, 1. Lord Anson nd Lucy, 2.

The FREE HANDICAP of 10 sovs each.—Mr. Whitworth's Lady Jersey, 1. Mr. Copeland's Cheapside, 2.

The QUEEN'S PLATE of 100 guineas.—Mr. J. Morland's King of Oude, 1. Mr. Greville's Cariboo, 2.

GREAT YARMOUTH RACES.—TUESDAY.

The VAUXHALL STAKES of 3 sovs each.—St. Fabian, 1. Allen Bray, 2.

The NORFOLK and SUFFOLK HANDICAP of 20 sovs each.—Col. Peel nd Gladiole, 1. Mr. S. Cowley's The Clown, 2.

The TWO YEAR-OLD STAKES of 10 sovs each.—Mr. W. Edward's The Old Lad, 1. Mr. Harris's Emperor f., 2.

The BOROUGH MEMBERS' PLATE.—Jack-in-the-Corner, 1. Bellissima, 2.

WEDNESDAY.

GREAT YARMOUTH HANDICAP of 10 sovs each.—Mr. E. Francis's The Juggler, 1. Mr. Drewe's Combatant, 2.

NELSON STAKES of 3 sovs each, and 20 added.—Mr. S. Cowley's The Clown, 1. Mr. Drewe's Combatant, 2.

GRAND STAND HANDICAP of 5 sovs each.—Mr. Waring's Manifold, 1. Mr. Drewe's Combatant, 2.

CONSOLATION HANDICAP of 2 sovs. each was won by Combatant, beating St. Ann by a neck.

LEICESTER RACES.—WEDNESDAY.

SCURRY STAKES of 3 sovs each, and 20 added.—Bird of Paradise, 1. Lysimachus, 2.

COUNTY CUP STAKES of 10 sovs each.—Westow, 1. Bedford, 2.

TWO-YEAR-OLD STAKES of 5 sovs each, and 25 added.—My Fancy, 1. Alarm colt, 2.

LEICESTERSHIRE HANDICAP of 15 sovs each.—Mr. Stevens's Britannia, 1. Mr. J. R. Scott's Avia, 2.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The Austrian loan has been officially announced, differing but slightly from the prospectus published under this head in the Number of August the 2nd. The subscriptions commenced on Tuesday last, and persons applying before the 15th are to have a bonus of 2 per cent.; and after that date, before the 23rd, 1 per cent, with a promise that they shall have all the stock they wrote for. Whoever takes stock to the extent of 50,000 florins, will be allowed 3 per cent. With all these temptations, we cannot learn that any one here has at present been rash enough to apply.

The fluctuation in Consols during the week has been trifling, the highest price being 96¼, and the lowest 96⅜ sellers. Business has been very limited, the principal members of the Stock Exchange finding the attraction of shooting and travelling more to their taste at this period of the year. Thursday was Account day, and the settlement passed off without the slightest difficulty, prices showing rather more firmness towards the close. Although prices generally are not quite so good as at the conclusion of last week, the reaction arose by purely speculative sales grounded on lower quotations coming from Paris. The unfunded debt remains at former quotations. India Bonds and Stock have not been in much request, but prices are maintained. The Market closed with tolerably firm tone, official quotations being—Bank Stock, 216½; Reduced, 96¼; Consols, 96⅜; New 3½ per Cent. Anns., 98⅝; Long Anns., to expire Jan., 1860, 7 7-16; India Stock, 260; South Sea Stock, Old Annuities, 90¾; Consols for Account, 96⅝; Exchequer Bills, £21000, 48 p; ditto, £500, 48 p; ditto, small, 48 p.

Mexican has fluctuated considerably during the week; quoting on Monday the reduced figures of 27⅜ to ¾, and rallying, according, on Tuesday, to 27⅝. The following day, on Wednesday, to 28, a rally ensued, and 27½ to ¾ has been since maintained. Spanish Stock has been flat, in consequence of the Cuba affair. The reply of Senor Bravo Murillo to the compliments of the Queen accepting the five shillings in the pound, but hoping for more another day, is unique. He states "that the honour and rights of the nation, and the Queen of Spain, will be *fully upheld* by the arrangement," and that any future hope must be regarded as an "impossibility."

Sardinian Scrip is lower than last week, quoting 2½ dis. In the other description of Stocks business has been very limited, and quotations have scarcely varied. The last prices are—For Brazilian Bonds, Five per Cent, 91¾; Chilian Bonds, Six per Cent., 104; Danish Bonds, 1825, Three per Cent., 79, Mexican, Five per Cent., ex Jan. Coups. 27½; Ditto, Account, 27½; Peruvian Bonds, Five per Cent., 90¾; Russian Bonds, 111¾; Sardinian Bonds, Five per Cent., Scrip, 2½ dis.; Spanish, Five per Cent., 1840, 20¾; Ditto, Account, 20¼; Ditto, Three per Cent., 36¾; Austrian Five per Cent., 84¼; Dutch, Two-and-a-Half per Cent., Account, 59⅝; Ditto, Four per Cent., Certificates, 93.

Shares have rather improved this week, the market displaying more activity as well as firmness. Closing quotations are—

ORDINARY SHARES AND STOCKS.—Aberdeen, 9¾; Ambergate, Nott, Boston, and Eastern Junct., 41 x d; Brist. and Exeter, 79 x d; Caledonian, 10¾; Chester and Holyhead, 13¾; Eastern Counties, 8¾; East Lancashire, 13¾ x d; Great Northern, 13¾ x d; Ditto, Halves, A, 8¾; Great Western, 77; Lancashire and Yorkshire, 49¾; Leeds, Northern, 10; London and North-Western, 115¾ x d; London and North-Western Quarters, 94 x d; Manchester, Buxton, and Matlock, 2¾; Manchester, Sheffield, and Lincolnshire, 23¾; Midland, 44 x d; Shrewsbury and Birmingham, Class A, 6¾; Ditto. Class B, 4¾; Shropshire Union, 3; South-Eastern, 19¾; South Wales, 58¾; York, Newcastle, and Berwick, 17¾; Ditto, Extension, 13¾; York and North Midland, 17¾ x d; Shrewsbury and Birmingham, 9¾ x d; York and North Midland, 8¾

FOREIGN.—Boulogne and Amiens, 10¾; Namur and Liege, 6¾; Northern of France, 14¾; Rouen and Havre, 9¾.

THE MARKETS.

CORN-EXCHANGE.—During the present week, the arrivals of English wheat, chiefly of the new crop, and of fine average condition, have been but moderate. Owing, in some measure, to the fasting off in the receipts of French flour, the demand for all kinds of wheat of home production has ruled steady, at full rates of currency. Fine foreign wheats have met with steady sale, in consequence of the limited supply; but low and middling qualities have commanded very little attention. Scarcely any English barley has come to hand; but the show of foreign has been extensive. Consumptive inquiries have met a slow sale, yet we cannot call them cheaper. In malt, only a limited business has been transacted. The supplies of foreign oats having been extensive, the trade for Irish has ruled dull, and the currencies have had a downward tendency. In beans, peas, Indian corn, and flour, very few sales have taken place.

ENGLISH WHEAT.—Essex and Kent, red, 38s to 43s; ditto, white, 40s to 47s; Norfolk and Suffolk, red, 35s to 42s; ditto, white, 38s to 43s; rye, 22s to 25s; grinding barley, 21s to 24s; distilling do., 25s to 28s; malting do., 30s to 35s; Lincolnshire do., 30s to 34s; brewers do., 34s to 36s; oats, 22s to 25s; ditto, 25s to 28s; maple, 25s to 27s; white, 26s to 27s; beans, 25s to 28s; per quarter. Town-made flour, 35s to 38s; Suffolk, 27s to 28s; Yorkshire, 28s to 30s per sack or 280 lbs. Foreign.—Barley, Danish and Russian, 24s to 26s; American, 22s to 24s; Canada, —s to —s; Odessa, —s to —s; per qr. Oats, Dutch, 20s to 22s; Irish, 18s to 20s; Jersey, 20s to 22s; Harvel Canada, —s to —s; per load. Flour, American, 27s to 28s per sack.

SEEDS.—We have a slightly improved demand for new rapeseed, at full prices. Canary and mustard on the rise of lower. All other articles more off heavily.

LINSEED, Calcutta, sowing, 60s to 62s; Baltic, crushing, 56s to 58s; Mediterranean and Odessa, 52s to 56s; hempseed, 32s to 34s per quarter. Coriander, 16s to 24s per cwt. Brown mustard-seed, 8s to 12s; white do., 6s 6d to 8s 6d. Tares, 8s 6d to 9s per bushel. English rape-cake, £6 to £6 5s per ton of ten quarters. Linseed cakes, English, £8 12s to £10 0s; ditto, foreign, £6 0s to £6 5s per 1000. Rapeseed cakes, £4 0s to £4 10s per ton. Canary, 40s to 43s per quarter. Hempseed, 36s per quarter. Coriander, —s to —s. Turnip-seed, —s to —s; white, —s to —s; extra, 4s to —s; white, —s to —s; extra, —s per cwt.

Bread.—The price of wheaten bread in the metropolis are from 6d to 6½d; of household ditto, 4½d to 5d per 4-lb loaf.

Imperial Weekly Averages.—Wheat, 38s 9d; barley, 26s 1d; oats, 20s 1d; rye, 30s 2d; beans, 30s 4d; peas, 31s 11d.

The Six Weeks Average.—Wheat, 40s 7d; barley, 26s 1d; oats, 21s 3d; rye, 29s 10d; beans 30s 10d; peas, 27s.

Duties.—Wheat, 16s; barley, 1s 0d; oats, 1s 0d; rye, 1s 0d; beans, 1s 0d; peas, 1s 0d

Tea.—Several public sales have taken place, but at which only a limited business was transacted, the demand generally having proceeded from most kinds of tea in very limited, at about stationary prices. Common sound Congou is quoted at 10d to 10½d per lb.

Sugar.—Fresh raised sugar has met a steady demand, although last week's prices, but most other kinds have moved off slowly, on easier terms. Good and fine yellow Barbadoes has changed hands at 37s to 41s; good and fine yellow Mauritius, 38s to 39s; white Bengals, 29s to 42s 6d; grocery yellow, 36s to 42s, and grocery white, 42s 6d per cwt. Refined goods are in moderate request, at 42s per cwt for lumps.

Coffee.—Most qualities have quiet at a full state of prices. Native Ceylon good ordinary has changed hands at 40s to 42s per cwt. Mocha fine, and of yellow or clear *Mids*—The general demand is in a very inactive state, but no material change has taken place in prices.

Spirits.—Leewards Island rum is in moderate request, at 1s 5d to 1s 6d per gallon, proof; whilst East India, proof, is quoted at 1s 3d to 1s 4d per gallon. We have a fair inquiry for brandy. Cognac, (old brands of 1840, is selling at 4s 6d to 5s 6d per gallon. Clovs steady, at 1s 7d to 2s, and British, made spirits, 9s 6d to 9s 6d per gallon, net cash.

Provisions.—Only the butter is good to quiet, at further advanced rates. Carlow, Clonmel, and Kilkenny, 78s to 79s; Waterford, 72s to 74s; Cork, 76s to 78s; Limerick, 68s to 73s per cwt.

Bacon.—Mild cured sides are dear, and in good request, 56s to 58s; middling ditto, 52s to 54s; lean ditto, 50s to 52s per cwt; fresh, 9s to 11s per 8os lbs. Foreign butter has advanced 4s per cwt. Prime strictly Waterford, 86s to 88s; Kerry, 84s to 85s per cwt. Lard, yesterday firm, at 45s to 46s for blockers, and 46s to 50s for kegs

Hops.—Our market is firm, and prices are still on the advance. New Pockets of the past is quoted at 36s 6d to 38s 6d; and old, 38s to 38s 6s per cwt. Town tallow 37s 6d per cwt net cash

Oils.—The general demand is in a very inactive state, but no material change has taken place in prices.

Spirits.—Leewards Island rum is in moderate request, at 1s 5d to 1s 6d per gallon, proof; whilst East India, proof, is quoted at 1s 3d to 1s 4d per gallon. We have a fair inquiry for brandy. Cognac (old brands of 1840, is selling at 4s 6d to 5s 6d per gallon. Clovs steady, at 1s 7d to 2s, and British, made spirits, 9s 6d to 9s 6d per gallon, net cash

Provisions.—Only the butter is good to quiet, at further advanced rates. Carlow, Clonmel, and Kilkenny, 78s to 79s; Waterford, 72s to 74s; Cork, 76s to 78s; Limerick, 68s to 73s per cwt.

Bacon.—Mild cured sides are dear, and in good request, 56s to 58s; middling ditto, 52s to 54s; lean ditto, 50s to 52s per cwt; fresh, 9s to 11s per 8os lbs. Foreign butter has advanced 4s per cwt. Prime strictly Waterford, 86s to 88s; Kerry, 84s to 85s per cwt. Lard, yesterday firm, at 45s to 46s for blockers, and 46s to 50s for kegs

Coffee.—Our market is firm, and prices are still on the advance. New P Y C on the spot is quoted at 38s 6d to 39

Sent free to any part of the kingdom for 1s 6d, 2s 6d, and 3s 6d each. Each is engraved with my name and address.—BARNETT

THE LOCK CONTROVERSY.—As several disgraceful and unwarrantable assertions are persisted in, the undersigned finding of two of CHUBB'S LOCKS by Mr Hobbs, an American Mechanic CHUBB and SON think it their duty to publish the following statement of facts:—
The first lock was purchased by Mr Hobbs himself at their shop in St Paul's Churchyard, and was shown, with its key, to a Mr Phillips several days before the so-called picking was made public. During that period there was ample time for him to do anything he chose with the interior.
The second lock was not, as reported, at the "State Paper Office," but on a cellar door at an empty house in Great George-street. Mr. Hobbs had access to the premises, and to the door, for a period of forty-eight hours, during which time he could, and we think did, do what he pleased with the lock.
Messrs CHUBB and SON have twice challenged him to a fair trial of skill—first, in the "Times" of June 10th, to try to pick a lock at the same manufactory as that of Mr Hobbs. This challenge was met in the same paper of the following day. The second challenge was given at a meeting of the Institution of Mechanical Engineers on June 18th when Mr Chubb produced two of his locks, and offered that they should be there examined by the Chairman, Mr Hobbs, or any other respectable and competent judges, to see that they were the ordinary commercial Chubb's Lock, and that Mr Hobbs should use his utmost efforts upon them, and have ample time allowed him to do so. This offer was also absolutely refused by Mr Hobbs, who was then leaving the country.
From these facts it is therefore evident that a bona fide CHUBB'S LOCK cannot be opened, unless it has been tampered with before hand; and that these Locks still maintain their long-established character for security. They have been in use for more than thirty years, and no instance has ever been known of a robbery having taken place there, or any one having be n picked.
It should be remembered that the lowest price of Mr Hobbs's American Lock, which he proposes as a substitute, is Fifty Pounds for each lock (by no means too much for such a complicated piece of workmanship); whilst the cost of CHUBB'S LOCKS ranges from ten shillings to fifty shillings.
57, St Paul's Churchyard, London.

NEW MUSIC.

UNDER the immediate PATRONAGE of HER MAJESTY.—Just published, a volume of SACRED HARMONY. Edited by THOMAS CHARLES—Kate Loder, Macfarren, Goss, Lucas, Henry Smart, Sterndale Bennett, Lovell, Phillips, Brinley Richards, H. Holmes, Barnett, Borrell, Dr. Wainwright, &c. Edited, and by special permission dedicated to his Royal Highness the Duke of Cambridge, K.G., by HENRY JOHN HAYDAY, Associate of the R. A. Music, and Member of the Conservatorium in Leipsic.
"This collection will be found most useful in musical families, where a higher order of composition than is usually met with can be appreciated, a want long felt and now efficiently supplied."—Globe.
"This is a judicious and interesting collection, containing works of high merit, and altogether possessing an interest not likely to pass speedily away."—Atlas
Price 31s 6d. London, ADDISON and Co., Regent-street; and by the Editor, 39, Queen-road, Bayswater, near Kensington Palace Gate.

"HAPPINESS."—Just published, the Second Edition of THOMAS BAKER'S BALLAD, entitled "HAPPINESS."—"Mr Baker, with melody flowing and expressive, has indeed set an attraction. The shape of a Fireside Song, to keep everybody in the house, supposing there be vocal talent in the family."—Musical World. Price 2s, postage free.—JULLIEN and Co., 214, Regent-street.

THE POPULAR SONG of the DAY, new edition, net issued—"TALK OF HIM THAT'S FAR AWAY." Composed by THOMAS CHARLES. Sung by Miss Dolby with great success at the Hanover. simplicity, and originality of melody, which, once heard, literally haunts the imagination, while it is within the compass of every amateur. The accompaniment, beautifully & destefully arranged in a way is in the most easy. Price 3s.
ADDISON and HOLLIER, 210, Regent-street

NEW SONG, "I MET HER in the CRYSTAL HALLS." Price 2s Sent postage free.
"This beautiful and expressive ballad will soon home to every frequenter of the Crystal Halls with a force and truthfulness quite delightful. The words are by J. E. Carpenter, one of our finest lyric bards; and the music by Frederick Glover, is perhaps anything from his long practised pen. No visitor from the country possessing a pianoforte should return without purchasing this charming souvenir of the World's Show."—Musical Review.
London. DUFF and HODGSON, 65, Oxford-street.

NEW SONG.—"THE YOUNG LADY'S NO" Written and sung by the Author of "Will you love me then as now?" "The Rich Man's Bride," "The Second," "Yes, I have met Love then," &c. Price 2s (sent postage free). This is a most pleasing ballad, just introduced most successfully by Miss Poole. Is likely to become one of the most popular songs of the day; both words and music possess that point which will ensure effect.
DUFF and HODGSON, 65, Oxford-street.

DIATONIC FLUTE.—By Royal Letters Patent. This instrument is exclusively played by Mr RICHARDSON, Flautist to her Majesty, Mr PRATTEN, first Flute at the Italian Opera, and 1,000 others. Testimonials from the Court, Town and in the Country, testimonials of whom will be forwarded free on application. Manufactory, 13b, Fleet-street.
A SICCAMA, Patentee.

TOLKIEN'S 25-GUINEA ROYAL MINUTO PIANOFORTES, nearly 7 octaves, O G fall. metallic plate, with all late improvements. In mahogany, rosewood, or walnut, or oak wood. The great peculiarity and worth of these pianos is, that they will stand any climate without injuring the tone, and their original beautiful tone and touch.—TOLKIEN, manufacturer, 27, 28, and 29, King Edward-street, London bridge. Drawing-room size.

CLARD'S MELODION, or FLUTE-TUNER Registered August 5, 1851.—The use of the Melodion is to either flatten or sharpen the pitch or tone of the Flute without playing, which may be done with the greatest ease and exactness, without removing the flute from the mouth, or the left hand from its position—the unremedied defect of flutes which every flute-player must have found whilst playing in concert. This instrument may be attached to any flute, on the same principle, the wood and metal, of various kinds, as well as his Patent Flutes, which require a very trifling change of fingering. It is not liable to get out of order, rendering the execution of music written in the flat keys much easier

LINENDRAPERS TO THE QUEEN.
INFANTS' BASSINETTES and BASKETS, and LADIES' WEDDING and GENERAL OUTFITS for the Season, at the Wholesale Warehouse of JOHN CAPPER and SON, 69, GRACECHURCH-STREET, LONDON, under contract Female Superintendence. Thy roses are economical, and the materials and needlework are first-rate.
BABY LINEN, of superior work, decidedly CHEAP.
Parcels of £3 are forwarded free to any part of England or Ireland.
SAMPLES, which may be returned, SENT for inspection, on receipt of a reference or money-order.
LISTS, with PRICES, sent POST-PAID.

FOR the AUTUMN.—NICOLL'S REGISTERED PALETOT and Morning Coats of various substances and prices, combining the advantages of Nicoll's Registered Paletot, being that price also.
The principal advantages of Nicoll's Registered Paletôt (which, with the above, are kept ready for immediate use) are too well known to need any description here.
CAUTION.—All of the N. NICOLL, Merchant Clothiers, Paletôt Patentees, &c., 114 to 120, Regent-street, and 22, Cornhill, since the commencement of the year 1850 have been sewed in the inside collar into the lining of each garment. They have, however, Agents who sell for them in the Country, who do not have the mark.

HAIR MEMENTOS.—ARTIST in HAIR.—DEWDNEY sends to Ladies resident in any part of the Kingdom a BOOK of SPECIMENS for two postage stamps. He also beautifully makes and supplies mourning Hair Rings, Hair Bracelets, Brooches, Rings, Chains, &c., at charges the most moderate.—DEWDNEY, 174, Piccadilly, Corner of Sherard-street.

RODGERS' TABLE CUTLERY.—The distinguished firm of JOSEPH RODGERS and SONS has long been honoured by the patronage of the Royal Family of England for their superior Cutlery, such articles of relief which is warranted. Table Knives, Razors, Pocket Knives, Scissors, and all kind of accustic instruments for relief of extreme deafness.—Messrs. R. and R. SOLOMONS, Aurists to H. Allsworth-street Piccadilly

THE LADIES' FRIEND.
ROWLANDS' AQUA D'ORO.—This is the most fragrant and refreshing Perfume ever yielded by the "Bosh of Pleasure;" it retains its fresh and delightful odoriferous for days. It is invigorating, gently stimulating, yet soothing, and in an instant the quintessential spirituous product For fanning fits, fatigues of dancing, oppression from over-crowded rooms, or intense summer heats, its use cannot be over-estimated. Price 3s 6d per bottle.—Sold by A. ROWLAND and SON, 20, Hatton-garden, London; and by Chemists and Perfumers.
N.B.—A Golden Fountain of the Aqua d'Oro is exhibited at the Crystal Palace

NO MORE PILLS NOR ANY OTHER DRUGS
DU BARRY'S HEALTH-RESTORING FOOD for INVALIDS and INFANTS.
THE REVALENTA ARABICA FOOD.
The only natural, pleasant, and effectual remedy (without medicine or purging, inconvenience, or exposure, as it saves fifty times its expense in other remedies) for indigestion, dyspepsia, flatulency, spasm, nausea, liver and bowel complaints, however deeply rooted, dyspepsia (indigestion), habitual constipation, diarrhœa, acidity, heartburn, biliousness, nervousness, constipation, palpitation, eruption of the skin rheumatism, gout, dropsy, sickness at sea, and all irritative and hysterical affections, at sea, and under all other circumstances, debility in the aged as well as infants, fits, spasms, cramps, and convulsions.
FOR A CURE OF 50,000 CURES
Cure No. 71, of dyspepsia, from the Right Hon the Lord Stuart de Decies—"I have derived considerable benefit from your Revalenta Arabica Food, and consider it due to yourselves and the public to authorise you to make this known."—STUART DE DECIES.
Cure 49,832.—Fifty years' indescribable agony from dyspepsia, nervousness, debility, stomach pains, spasms, flatulency, sickness, which my servant had used the science of many, have been effectually removed by Du Barry's delicious food in a very short time I shall be happy to answer any inquiries.—Rev. ROBERT SARGOOD, Beddington Rectory, Norfolk.
In London are Agents—Fortnum, Mason, and Co, 182, Piccadilly, purveyors to her Majesty the Queen; Hedges and Butler, 155, Regent-street; Sutcliffe, Dunsby, and Co, Cornhill, and with full instructions, in 1 lb., 2 lb. 4s 6d; 5 lb. 11s; 10 lb. 22s; super-refined, 5 lb. 22s; 10 lb. 40s; or 12 lb., the most economical for large families, on receipt of post-office order.—DU BARRY and Co, 127, New Bond-street, London.

DU BARRY'S celebrated FOOD for DELICATE INFANTS, CHILDREN, and INVALIDS.—Wet-nursing, always precarious, and sometimes dangerous, and expensive when had, is superseded by Du Barry's infant's delicious Food. In packets s. 1s and 2s. and in large canisters at 21s. These packets are forwarded, on receipt of Post-office orders, free of carriage, to the end of any railroad from London, by DU BARRY and Co, 127, New Bond-street, London. Prospectuses may be had gratis and post-free

MILTON'S HAIR LUBRICANT.—How often do we hear from the lips of some fair friend. or reply to the question of "Why do you not curl your Hair?" "It is so very weak, it will not keep in curl, if I do." Hitherto there has been no remedy for this weakness so frequently complained of. A proper and judicious use of MILTON'S HAIR LUBRICANT, the only natural promoter of the growth of the Hair, will speedily restore it to a healthy state, and weak Hair will only be known by name. In an elegant toilet pot price 3s each. Sold by all perfumers and medicine vendors in town and country. Wholesale London agents—Messrs. Barclay and Sons, Farringdon-street; Edwards, 64, Paul s Churchyard; Sutton and Co., Bow-churchyard, Sangar, 51, Oxford-street; and Hannay and Co., 63, Oxford-street.

LONDON: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes in the county of Middlesex, by WILLIAM LITTLE, 198, Strand, aforesaid.—SATURDAY, SEPTEMBER 13, 1851.

THE ILLUSTRATED LONDON NEWS.

No. 517.—VOL. XIX.] SATURDAY, SEPTEMBER 20, 1851. { TWO NUMBERS, 1s. WITH WHOLE-SHEET SUPPLEMENT, GRATIS.

THE ARCTIC EXPEDITIONS.

A RAY of hope has broken in upon the darkness which has so long surrounded the fate of the gallant Sir John Franklin and his companions. Expedition after expedition has returned, bringing no news of the wanderers, or only such scanty and indefinite information as served to defer hope and make the heart sick. But more positive intelligence has at length been gained. The brave mariners have not been found; but it has been proved almost beyond the possibility of a doubt, that the Great Arctic Ocean has been discovered, that Sir John Franklin has sailed into it, that, in confirmation of a supposition entertained long since, this vast Polar Sea enjoys a milder temperature than the Arctic regions previously known, and that it abounds with animal life. Under these circumstances, despair for the safety of these gallant men is clearly premature, and another effort to rescue them, if living, and to discover their fate, if dead, is no less clearly the sacred duty of the nation.

The information on which this hope is founded was brought by Captain Penney, of Captain Austin's expedition, and is of a date considerably later than the accounts which appeared in our Journal of last week. That our readers may fully comprehend the importance of the intelligence, we shall recapitulate as succinctly as we can the efforts hitherto made, and the course taken by the last expeditions which were sent to the rescue. When he left England on this memorable, and let us earnestly hope, this not altogether fatal expedition, Sir John Franklin received from the Admiralty instructions as to the course he should pursue. In the first instance he was to proceed through Barrow's Straits as far as Cape Walker, at the western extremity of that channel, and from thence endeavour, by sailing in a south-westerly direction, to reach Behring's Strait. In case of his inability to discover a channel in the direction indicated, he was directed to retrace his course down Barrow's Strait as far as Wellington Channel, and to try a north-western route to the desired point—Behring's Strait. It seems reasonable to believe that the gallant officer met with no casualty

THE EUPHRATES VALLEY ROUTE TO INDIA.—BAY OF ANTIOCH: MOUNT CASIUS IN THE DISTANCE.

THE EUPHRATES VALLEY ROUTE TO INDIA.—ALEPPO, FROM THE ANTIOCH ENTRANCE.—(SEE PAGE 340.)

which could have swept him and his whole expedition away without leaving a trace behind, at so early a point of his attempt as the entrance to Barrow's Strait. Presuming that he sailed in safety to far, and that he carried his first instructions into effect, Barrow's Strait was thoroughly searched by the English, if not by the American expedition—though on this latter point we are not over confident—and no trace whatever were discovered. Not only as far westward as Cape Walker, the point named, but to Banks's Land, a considerable distance beyond it, was examined, and the result was, that no opening could be discovered by which Sir John Franklin could have sailed to the south-west. The country is justified in believing, therefore, that, having proceeded as far as he could in that direction, he retraced his course, as instructed; and that the South-Westerly Passage having been proved to be impracticable, he tried the North-Westerly one. If there could be any doubt on this point, it is set at rest by the discovery of palpable traces of the expedition at a place called Cape Riley, at the entrance of Wellington Channel, which branches off to the north-west at the very point mentioned in Sir John Franklin's instructions. It is known that Sir John and his crew passed the winter of 1845-46 at this place; and it is supposed—and Captain Penny's researches go far to strengthen the supposition—that immediately on the break up of the ice in 1846, Sir John proceeded in the second route indicated, and reached the Great Arctic Ocean, of which Captain Penny is now able to affirm the existence.

Captain Penny started northward from the neighbourhood of Cape Riley last winter—or, more properly speaking, in the early spring—and travelled in sledges over the ice for a distance of nearly two hundred miles. Some other parties, dispatched by Captain Austin, travelled still further by the same means. Captain Penny ascertained that Wellington Channel, not very far from its entrance, bends suddenly to the north-west, the very route supposed to exist, and which Sir John, failing in his first effort, was expressly ordered to take; and, pursuing his course for 180 miles from the junction of the channel with Barrow's Strait, he found the ice getting soft and unsafe, and, as we are informed by a daily contemporary, "discovered an open sea, with innumerable flocks of birds, Arctic animals, driftwood, and various other signs of a more clement climate." He also saw for sixty miles beyond him, "a clear, unobstructed expanse of water," which he named the "Queen Victoria Channel." Long and ardently we must suppose that the hardy sailor gazed upon the prospect before him; but, as his further progress along the shores of this tempting sea was impossible, from the state of the ice, he was reluctantly compelled to return as he came. But, with the characteristic vigour of his profession and his country, he was still undaunted. He travelled 180 miles back to his ship, and procured a boat, which he conveyed by sledges, after much difficulty, to the shores of that clear northern sea which seemed to invite his researches. But his gallant effort was doomed to be disappointed. When he reached the spot where the prospect had first opened out before him, he found large masses of ice drifting in to the shores from the north-west with a strong wind and a heavy sea. It would have been madness to have risked such a passage in a small boat, and with only a week's provisions. Captain Penny therefore turned back a second time, perhaps with a heavy, certainly with a hopeful heart; for he is now in London, urging upon the Government, with all the eloquence and zeal of which he is master, the duty of immediately dispatching a powerful steamer to the new point thus indicated.

It may be asked, why Captain Austin, having two steamers as well as two other vessels under his command, did not follow up the clue discovered by his subordinate in command, and why he returned to this country in a manner which is unexpected, and, as many believe, premature? To this question we are unable to give any positive answer until Captain Austin shall himself throw light upon it. It is alleged, however, that he had not provisions enough, and that the Admiralty, unintentionally but most unfortunately, kept him uninformed of the fact which might have changed his determination—that the supplies sent out last year by the *North Star* were within his reach, and amply sufficient to have warranted the attempt. But on this subject we shall doubtless hear more hereafter.

In the meantime, let us hope that Captain Penny will not sue in vain; and that not a day will be lost by the Admiralty in responding to the appeal, or, if they have reasons for not doing so, in informing the public of the grounds of their refusal. We see by the American journals that the greatest interest is excited throughout the Union by the circumstances, and that our enterprising friends across the Atlantic talk of fitting out the steamer wanted, and of robbing England of the glory of the enterprise. Better this than delay; but better, far better, in our opinion, would it be that the Admiralty should send out the steamer which Captain Penny demands, or half-a-dozen steamers if necessary. "There is not an officer, not a seaman of the United States navy," says the *New York Tribune*, "but would deem it a glorious privilege to be one of the company bound outwards upon that adventurous steamer's deck." Shall not the same be said of the navy of England? It would be, indeed, a national stigma, if, the English Admiralty having refused to take air in the matter, the Americans should discover, either alive or dead, our long lost countryman. But we think there is little fear that such a scandal will befall us.

STEAM COMMUNICATION BETWEEN LIVERPOOL AND SOUTH AMERICA.—A company has been recently formed for establishing a line of steamers between Liverpool and the other principal places of trade on the south coast of America. Three screw steamers, of 1500 tons burthen each, and about 300 horse power, will, in the first instance, be built for the Rio line. These vessels will be modelled after the most approved principles, and, with the ample power proposed, it is confidently anticipated that an average speed of at least ten knots per hour will be attained. The branch boat will be of smaller dimensions, suitable for the navigation of the River Plate. Their departure from Liverpool will be regulated by the boats calling at Lisbon for passengers and fuel. It is calculated that the passage to Rio will not exceed 25 days, and that the whole distance to the River Plate will be accomplished in 35 days, including the detention in Rio to transfer the cargo and passengers to the branch boat. The company is supported by the principal merchants and shippers in the trade, to whom, and other capitalists, a number of the shares are allotted, the remainder being offered to the public. A charter of incorporation has been obtained, which limits the responsability of shareholders to the amount of their subscriptions. The importance and extent of our trade with Brazil and the River Plate, and the necessity which exists for a more perfect postal communication with these countries, mainly suggested this enterprise; and, accordingly, the first efforts of the company will be devoted, not only to supply the desideratum of a bimonthly mail, but to afford to shippers of goods a cheap and speedy conveyance, which the acceleration of the mails over the old system of sailing packets renders most desirable. We understand that the models decided upon comprise all the most recent improvements in naval architecture, and that no expense will be spared to render them, if possible, superior to any other class of steamers afloat; and, if we may judge from the immense success that has attended the recent establishment of a line of steamers to South America and a comparatively insignificant town like Southampton, we have every reason to be sanguine of the success of investing from the most important and increasing port in the world, Liverpool, surrounded as it is by extensive manufactories of every description, and with rapidly-extending facilities for the transportation and shipment of merchandise. The first steamer of this line will be despatched on the 31st of June, and arrive at Rio in time for the mail that port on the 31st, and reaching Liverpool again on the 29th of August, 1852.

CRICKET MATCH.—A match took place on Saturday last between the Kendal Quakers' School Cricket Club, and sixteen of the Kendal Friends' School Cricket Club (including John Richards, of the Kendal Cricket Club), when the Quakers proved victorious by five runs. The National [illegible] having lost three, sent in their opponents to bat, who succeeded in scoring 56. The National School Club then went in, but their opponents were too many for them, and they only scored 17. The Quakers went in, and obtained a score of [illegible] runs, when the Kendal Friends went in, and obtained a score of 51 [illegible] their second innings. The Quakers went in, and obtained the [illegible] runs, thus winning the match by five runs. A very handsome dinner was provided for the Friends in the Strickland Arms on Monday, which passed off to the best. It is said that the driver of the vehicle was really against another omnibus. He was taken into custody.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The extreme severity with which the French Government considers it necessary to visit those journalists who take up a decidedly hostile attitude to the "powers that be" is somewhat startling, and appears to us this side of the Channel cruel and oppressive; for it is difficult to believe that society at the present moment in France is in a state to excite hatred and contempt of the Government by the article in question, which charged the Government with having made the recent arrests of Germans and Italians at the desire of the Continental Sovereigns, and having thus violated all the laws of hospitality. A verdict of guilty, without extenuating circumstances, was returned by the jury, and M. F. Hugo was sentenced to nine months' imprisonment and 9000f. fine, and M. P. Meurice to nine months' and 3000f. fine. The Court also ordered the suspension of the journal for one month. It is said, however, that M. de Girardin, who is considered to be the real proprietor of the *Evénement*, has contrived means by which the suspension will be prevented. A new *cautionnement* has been made up, a journal to be called the *Audacieux*, and under this title the *Evénement* is to be published. The two sons of Victor Hugo are now in prison.

The President of the Republic presided at an imposing ceremony on Monday, viz. the laying the foundation stone of the New Great Central Market of Paris. He was accompanied on the occasion by the Minister of the Interior, his *aides-de-camp*, and other official personages. The weather was beautiful, and the whole population was out of doors. The scene within the church of St. Eustache, where the ceremony took place, was accurately very exhilarating—the windows of the houses in the neighbourhood were filled with spectators, but there was nothing whatever in the shape of political demonstration. Louis Napoleon arrived at one o'clock, and was received by the Prefect of the Seine, the Archbishop of Paris, the Curé of St. Eustache, and a large body of the clergy in full canonicals. After the religious portion of the ceremony had been obtained by the Archbishop of Paris, the Prefect of the Seine presented the President of the Republic with a box containing models similar in honour of the occasion, and a bronze plate, on which the following inscription was engraved:—

[illegible]
Le Président de la République Française,
Louis Napoléon Bonaparte,
A pour fondateurs de la Halle centrale de Paris,
[illegible]
[illegible]
[illegible]
[illegible]
Et des Membres de la Commission Municipale.
[Here follow the names.]

The Prefect at the same time delivered an address to the President, in which he reminded him that the Emperor Napoleon I. conceived the project of constructing large central markets in Paris, worthy of the capital of France, and that the Prince laying the first stone of additional constructions for the same useful purpose, was, in fact, only a continuation of the Emperor's design. The President replied, in concise terms, that he was happy in having the opportunity of realising the views of the Emperor, whose fertile mind had devised so many great works for the benefit of France. The Prince's reply was altogether devoid of political allusion, unless a political meaning can be extracted from the assertion that "labour ought to put down all spirit of disorder amongst the working classes." The President, as usual, did not extemporise, but read the few phrases which constituted his reply.

The box was then passed to the architects, who placed it, together with a small case containing the various pieces of money of the Republic, on the spot appropriated for the reception of the first stone. The stone and other articles having been laid in their places, the President threw from a silver trowel a small quantity of mortar on the stone, and the ceremony was over.

Before withdrawing, the President turned towards M. Léon Faucher and said, "I am aware that every instant of your time is devoted to the duties of your office. I cannot but acknowledge such devotedness to the public good, and I accordingly nominate you Commander of the Legion of Honour." The following decree was also announced to M. Berger and M. Carlier that he had also promoted them to the same rank in the order.

The President then left the ground, and returned to the Elysée in the same order as he came.

A vast crowd of persons continued all day in the neighbourhood of the spot where the ceremony took place, and the most perfect order was observed.

On Tuesday, a deputation, consisting of about 300 of the female sellers of fruit and vegetables of the neighbourhood of the Rue Montmartre, dressed in their best attire, many of whom had their children with them, waited on the President of the New Central Market on the previous day, and presented Louis Napoleon with a magnificent set of bouquets, paid a visit to the President at the Elysée yesterday morning, when they also, by appointment, breakfasted at ten o'clock. After enjoying themselves for some time in the gardens, they partook of refreshments, which had been unsparingly provided for them. The President, who had entered into the most familiar conversation with the ladies, took a glass of wine, and proposed "To the health of the ladies of the market of Paris," which was duly responded to; after which "The health of Louis Napoleon" was drunk amidst enthusiastic cheering. The ladies withdrew shortly afterwards took their leave, highly gratified at the cordial reception they had met with.

The President of the Republic has dismissed the Mayor of the Commune of Bic, and the Deputy Mayor of the commune of Ayase, for improper conduct during the late elections.

The Paris journals state that the English and French Cabinets will address separate notes to Washington relative to Cuba

A document has been seized by the police from the German refugees, which amounts to a plan for the establishment of a reign of terror, and the confiscation of property.

The department of the Ardèche, where the political riots lately took place, has been placed in a state of siege, and it was expected that some other departments would likewise be subjected to a similar measure.

HOLLAND.

On Monday last, the 15th, the King of the Netherlands opened the States-General. His Majesty's speech alluded to the favourable state of the country—to the conclusion of treaties with various states for increasing commercial intercourse—to the progressive development of trade and manufactures—to the improvement of agriculture—to the increased modes of communication by land and water—and, finally, to the favourable appearances of the exchequer, which would enable his Majesty to submit at an early period measures for diminishing the public debt.

UNITED STATES.

The accounts that have come to hand New York of the fate of the Cuban expedition are, as usual, contradictory.

According to the one most generally accepted statement of matters which was circulated in New York on the 4th instant, the American Government at Washington had received information, that, up to the 28th August, Lopez had been able to maintain himself in the province of Puerto Principe; that no troops had joined him; and that his prospects were desperate; that it was a personal struggle for his own and the lives of his few remaining followers. No reinforcements had gone from New Orleans, and the Government was successfully exerting itself to prevent any.

According to other accounts, which, however, are not of so recent a date as the foregoing, Lopez had succeeded in what has been unsuccessful in all his attempts, and General Enna, the Spanish military commander, as having been killed, together with a great number of his followers. Reinforcements of Creoles, also, were said to have joined the Spanish cause. These statements would, however, be taken with great caution, and are flatly contradicted on very tolerable authority.

Although the excitement about the matter throughout the States had been very great, it was fast becoming less violent, and several of the leading journals of the United States had taken a bold stand against the attempt made by interested parties and a misguided young man, led by a few reckless adventurers, to force their ideas of good government on a people that have neither invited them to their shores, nor, when there, showed any disposition to join them in their unlawful proceedings.

The collector of customs at New Orleans has been removed from office for alleged indifference in Cuban matters.

It appears, with reference to Mr. Owen, the Consul at Havannah, that the man who were executed had gone to wrote to their friends. A number of these letters came into the possession of the Spanish Consul at New Orleans, whose intention was to forward them to the Department of State, the usual course with the effects of Americans dying abroad; but, on the representation of many persons, he deposited them, in the post-office, and some of them had reached their destination. Many of these letters have been published. From them it appears that Col. Crittenden and 114 men were left at a small farm house (which is doubtful, as they would probably have been taken to Havannah); and a Spanish Lieutenant is represented as having reported that on the 14th he came upon twenty of them, guarding an equal number of their wounded comrades, all of whom were massacred. It was reported that the remaining twenty-four were afterwards slaughtered.

The New Orleans papers also publish letters from Brandt, James, and Kerr. They are very brief in their statements to friends

As to the domestic affairs of the United States, the accounts this week contain little of interest.

Considerable space is occupied in the columns of the New York papers, by the reports of several additional cases of arrest of fugitive slaves in various parts of the Union.

CANADA.

The Canadian Parliament was prorogued by the Governor-General, on Saturday, the 30th of August. The Royal speech represents the revenue as in a satisfactory state, and refers to the grants for improving the navigation of the St. Lawrence, and to the reduction of the emigrant tax. Six bills were reserved for the approval of the Queen, three of which relate to churches and rectories, two to the reduction of salaries, and one to the incorporation of the Fort Erie and Buffalo Suspension Bridge Company. The reciprocity question was left unsettled.

The reduction sin the civil list, authorised by the Imperial Government, have been carried out by the Legislature. The salaries of the Chief Justices and that of the Chancel or are to be reduced from 4800 dols. to 3600 dols. a year, upon the departure of the present incumbents from office.

The potato rot is prevailing to a great extent in Upper Canada.

INDIA AND CHINA.

Advices by extraordinary express, dated Calcutta, August 8, and China, July 24, have been received this week. Cholera was very rife, and vast numbers of the people fell victims to the disease.

The state prisoner, Moolraj, ex-Dewan of Mooltan, had been removed from Calcutta to Allahabad, in consequence of serious indisposition, and not from a plot to effect his escape, as falsely reported.

The territories of the Nizam had escaped seizure for the present by payment of a great part of the debt, viz. 40 lacs of rupees.

On the 6th July, no less than 60,000 Indians were congregated together to witness the dragging of the car of Juggernath.

A gaol delivery took place at Agra on the 2d of August. Amongst those discharged were Dosbet Dut, nephew of Dewan Moolraj, Toulsee Ram Rauz, Koolpus Rae, and Futteh Mahomed Khan.

A rumour was afloat that the hill tribes near Peshawur had successfully attacked our troops; but subsequent inquiry led to the belief that it was destitute of truth. The troops at Pesawur were suffering much from illness. Ghoolab Singh was engaged in hostilities with some of his neighbours in the mountains to the north of Cashmere, but with what results we are not informed.

We have no intelligence whatever from Bombay by this arrival.

From China the accounts by the present mail are of more than usual interest. The insurrection was spreading, and in Canton itself had taken place at Lin-tsin-ti, in which the Imperial General Wu-lan-ti was totally routed, with a loss of 1000 men, while he himself was so severely wounded in the arm, that it was expected amputation would have to be resorted to. Confidence had been given to all British merchants, that in future no British consuls would be allowed to interfere with the collection of duties on articles imported or exported by vessels belonging to Great Britain. This order had created considerable satisfaction among those to whom it is addressed. We are sorry to learn that the troops at Hong Kong are suffering from sickness; but still not so much as at the corresponding time last year. The following is an extract of a letter dated Singapore, 30th of July:—"I deeply regret to inform you of the total loss of the Peninsular and Oriental Company's steam-ship *Pacha*, sunk on the night of the 21st inst. off Mount Ophir, 200 miles from Singapore, after sustaining a severe collision with the *Erin*, by which the latter vessel has been considerably damaged. sixteen lives have been lost, including those of the third officer and two third-class passengers."

THE GREAT CABLE FOR THE TELEGRAPH BETWEEN ENGLAND AND FRANCE.

On Wednesday, the great cable, 24 miles long, and destined, when sunk between Dover and Calais, to form the key of communication and correspondence between this country and the European continent, was completed at the works of the Submarine Telegraph Company, Wapping, the last coil being securely circumfixed at about four o'clock. The occasion furnished an interesting opportunity for observing the rather novel and noticeable processes employed in the fabrication of this newly devised agency for the international communication as worked out through the medium of gutta percha and the wire-rope machine. Entering the factory, situated in the High street, there are two well-constructed wire-rope machines, each about 20 feet high and 15 in circumference, representing a large hollow cone in the form of a cupola, with a shaft or cylinder in the centre, worked by a steam-engine of five-horse power. Obedient to the ringing of a bell, a concourse of workmen from the wire-rope works of Messrs. Newall, at Gateshead, and other places round one of the machines employed in the first process. The machine, the action of which is vertical, being set in motion by the steam-engine, the first or interior portion of which the composite cable consists was payed out on to the shaft. This first layer is composed of four electric copper wires, known as the 16 wire gauge, each encased in a covering of gutta percha of a quarter of an inch in diameter, passed in a reverse direction, and with the assistance of the manipulators, are twisted and plaited in spiral convolutions in the manner of an ordinary rope or cable round the shaft. The next superincumbent coil of 16 wires consisted of hempen yarn previously saturated in a reservoir of prepared pitch and tallow, and in its turn is tight twisted and compressed, impermeably and by steam power, over the gutta percha with its enclosed copper wires. This vertical again with a series of lampen yarns, five or six in number, and about an inch in diameter, saturated in the pitch and tallow, with the view of what the workmen call "warming" the gutta percha. This completes the first process, and the manufacture of the rope in the spiral form is for the present at a stand. The gutta percha and the more perishable gutta percha, which ultimately has thrown over it a coat of metal of great strength

STEAM COMMUNICATION WITH AUSTRALIA.

The following are the conditions upon which the Lords Commissioners of the Admiralty are ready to receive tenders from persons willing to provide for the establishment of steam communication with Australia, the tenders to be delivered on the 4th December. The contract to continue in force for four years, and may be terminated by a twelvemonth's notice from either party.

"The tenders are to be for vessels propelled by screws, and they may be made either for a line of steamers between the Cape of Good Hope and Sydney, in continuance of the existing line between England and the Cape, or for a new line embracing the whole way from England to Sydney.

"The parties tendering are to frame their offers for two different contingencies:—

"Under the first, the steamers would be required to stop at King George's Sound, Adelaide, and Port Philip, on their way to and from Sydney.

"Under the second, the steamers would stop only at Port Philip outwards, when a branch steamer, to be provided by the contractors, would take the mails and convey them to Adelaide and King George's Sound, and return to Adelaide to meet the homeward steamer.

"The tenders are to state for what annual sum each of these two routes would be undertaken by iron as well as by wooden vessels; and also the day on which the parties will be prepared to commence the service.

"The contractors must engage to convey the mails and despatches six times in a year each way, and will have to deliver and receive mails at King George's Sound, Adelaide, and Port Philip, and at such other places as the Lords Commissioners of the Admiralty may from time to time determine and direct, both on the outward and homeward voyage to and from Sydney.

"They must also engage to convey them at a speed which, on the average of each voyage, shall not be less than 8½ knots an hour; and, as a precaution against failure in this condition, no vessel will be accepted for the performance of the contract who is not found, on trial at the measured knot on the Thames, to attain the speed of nine knots an hour, to the satisfaction of the said commissioners, propelled by steam alone and without the aid of sails.

"They must likewise engage to supply, during the continuance of the contract, vessels equal in number and size to those specified in their tender, and these vessels are to be subject at all proper times to survey by officers in the employment of the Admiralty; and any defect discovered on such survey to be immediately made good by the contractors. This survey to extend to the crew, officers, and engineers and machinery, as well as the hull of the vessel.

"The vessels to be always supplied and furnished with all necessary and proper machinery, engines, apparel, furniture, stores, tackle, boats, fuel, oil, tallow, provisions, anchors, cables, fire-pumps, and other proper means for extinguishing fire, lightning conductors, charts, chronometers, proper nautical instruments, and whatever else may be requisite and necessary for equipping the said vessels and rendering them constant y efficient for the service to be performed, and also manned and provided with legally qualified and competent officers, and a sufficient crew of able seamen and other men.

"The days and hours of departure and arrival at each port are to be fixed by the said commissioners, and may be altered from time to time by them on giving a notice to the contractors of three months.

"The said commissioners are to have the power of ordering the vessels to be so arranged and constructed as to be capable of carrying with efficiency such armament as they may consider suitable; and the purposes may require the designs and plans of all vessels to be laid for the performance of the contract, to be submitted to them previously to their construction.

"Proper accommodation to be provided, free of expense, for the naval officer in charge of the mail; but the parties tendering are at liberty to state what deduction they would make in the event of this condition not being required.

"A penalty of £1000 to be incurred when the contractors fail in providing a vessel, in accordance with their agreement, ready to put to sea at the appointed hour; and also the sum of £50 for every successive day which shall elapse until such steam-vessel shall actually proceed to sea; but the payment of such penalty shall not be enforced in the event of such default being proved to the satisfaction of the said commissioners to have arisen from circumstances over which the contractors and their servants had no control.

"A penalty of £100 to be incurred if the vessels stop, linger, or deviate from the right course, or put back or return, except from stress of weather or other unavoidable circumstance, or unless authorised by the officer in charge of the mails.

"The said commissioners shall at any time during the continuance of the contract, in case of great public emergency, have power and be at liberty to purchase all or any of the said vessels at a valuation, or to charter the same exclusively for her Majesty's service, at a rate or hire to be mutually at the time fixed and agreed on by them and the contractors; but if any difference should at any time or times arise as to the amount of valuation or hire so to be paid, such difference shall be referred to two arbitrators, one to be chosen from time to time by the said commissioners, and another by the contractors; and if such arbitrators should at any time or times not agree in the matter or question referred to them, then such question in difference shall be referred by them to an umpire to be chosen by such arbitrators before they proceed with the reference to them; and the joint and concurrent award of the said arbitrators, or the separate award of the said umpire when the arbitrators cannot agree, shall be binding and conclusive on all parties.

"The contractors shall undertake for themselves all arrangements relative to quarantine, as connected with the due and regular performance of the conditions of the contract.

"The contractors shall not assign, under-let, or dispose of the contract, or any part thereof, without the consent in writing of the said commissioners; and in case of any deliberate or wilful breach thereof by the contractors, the said commissioners may terminate it without any previous notice to them, nor shall they be entitled to any compensation in consequence of such deter mination.

"No member of the House of Commons shall be admitted to any share or part of the contract, or to any benefit to arise therefrom, in pursuance of the provisions of the act of Parliament.

"The contractors to be bound with two responsible sureties, to be named in their tenders, in the penalty of £4000, for the due fulfilment of the contract; and they must furnish the names of the parties of whom inquiries can be made as to their responsibility."

THE GOVERNMENT AND THE AUSTRALIAN PACKET SERVICE.

The advertisement from the Admiralty for tenders for a steam communication to Sydney at intervals of two months, by the Cape of Good Hope, at a speed of 8½ knots per hour, is looked upon in the City as simply ridiculous. It has not awakened the slightest interest on the part of any of the merchants connected with Australia, and the only hope it seems to have created is, that it may serve as another and final illustration of the way in which our mail contract system is suffered to cripple a branch of enterprise for which we have greater advantages than any other nation. The population of Australia, exclusive of New Zealand, is little short of 400,000 souls, and its rate of increase has been about 100 per cent. in 10 years. She takes of our manufactures an annual total of between £2,000,000 and £3,000,000 sterling, that is to say, as much as the whole of our North American possessions, more than the whole of our West Indian colonies, insular and continental, including Honduras, and more than four times as much as the Cape of Good Hope. Steam-mail contracts to our North American colonies have been granted for the last twelve years, and now cost £189,000 per annum. By the West Indies the same advantage has been enjoyed for ten years, and the cost per annum is £240 000. Lastly, to the Cape a similar grant has been made, involving an annual expenditure of £31,000. Under these circumstances, Australia (or five years importuned the Government either to deal with her in the same way, or, at all events, to leave her free to obtain from our merchants and capitalists the natural benefits which her enormous and growing trade would speedily have ensured. She offered, moreover, to contribute some portion of the expense. But, although the cry continued throughout the whole of that period, and scarcely a letter was received from her merchants which did not contain some bitter expression at the treatment practised, neither warnings nor appeals had the slightest effect. The public meetings of the colonists, which were almost confined to petitioning for steam communication, and protesting against convict immigration, were answered by steady obstruction in the former case, and in the latter by the introduction into Van Diemen's Land during the past year of no less than 3894 criminals. Finally, the announcement was made that what had been denied to Australia, with her 400,000 prosperous and enterprising inhabitants, was forthwith to be granted to our African stations at Sierra Leone, Cape Coast Castle, and Fernando Po. The crowning fact of the history seemed thus attained, and here it actually stood at the commencement of the present month.

Suddenly, however, came the news, which may possibly, in the course of another year, attract to Sydney every ship and steam-vessel that can get there. The number of ships that entered San Francisco in the quarter ending September, 1850, was 464, with a total burden of 149,354 tons—many of them steamers of the largest kind, which have since been followed by others, working not only without the advantage of a Government contract, but absolutely in profitable connection with those so favoured. With her existing population, her splendid climate, and other attractions for immigrants, no reason could be shown, supposing the gold discoveries confirmed, why the marvels to be witnessed at Sydney should not exceed those of California. At this juncture the Government resolved to act, and consequently, to a colony which can now boast the prospect of seeing its harbours thronged with ships of all kinds and all nations, the boon is at length conceded of a slow steamer from the mother country six times in a year. Anything more ludicrous was perhaps never yet recorded, even among all that has occurred in the shape of Government interference with commerce. But, absurd as it is, the evil connected with it may still be serious. So completely has self-reliance been deadened in this country as regards the establishment of steam lines by the pernicious influence of monopolies, that even with existing prospects it is probable no body of persons will be found bold enough to start an independent enterprise. More than a year ago, the Pacific Steam Company, of Liverpool, tendered a monthly mail for £48,000 per annum. If it were safe at that time to offer to undertake it wi ' such a payment, the improved circumstances of Australia, her increased traffic with the west coast of America, and the opening up of the Nicaragua transit, to say nothing of the gold question, would now seem at least to warrant an experiment without any such aid. Of course, if the postages, or even half of them, were allowed, there would not be a moment's difficulty, but it is in that point that the power of the Government lies; and, as it is hopeless to endeavour to disturb their routine views, whatever is now done should be done without them. The colonists, moreover, would be far more willing to patronise and make sacrifices for a line that should boldly start on its own resources, than for one which had subjected itself to all sorts of niggling shackles and delays in negotiating with the miserable and humiliating invitations of the Lords of the Admiralty. At all events, if the gold news be confirmed, and no steps are taken, we may at once resign the South Pacific to the Americans, along with the North. They know the field it presents, and if we are indisposed to share it with them, it is to be hoped we shall be rational enough not to complain when they shall render the service to our fellow-countrymen at the antipodes, of regularly conveying goods and intelligence many days in advance of the remarkable fleet for which, since the receipt of the recent tidings, the Government have so suddenly advertised. *Times.*

TELEGRAPH IN BRITISH NORTH AMERICA.—The wire between Quebec and Halifax, including the submersion in the Gulf of St Lawrence, is nearly completed. A new feature, alike feasible for adoption, but apparently not thought of in this country, has been introduced in America—that of marking the distance by railway on the telegraphic poles, at given ranges.

GREAT WESTERN RAILWAY.—The directors having taken possession of the Kennet and Avon Canal, have been over it to make the necessary traffic arrangements for working it in connexion with the railway, to commence on Monday next.

CONVICT PRISON AT PORTSMOUTH.

A large convict prison, designed as a substitute for the present mode of locating convicts on board hulks in the harbour, is now being completed at Portsmouth. At its commencement the inhabitants of the borough manifested much opposition and repugnance at the location of a large number of convicts on shore and in the midst of a dense population; but this opposition has since subsided, although much of the repugnance remains, and the Home-office has proceeded with the rapid erection of the building. The prison is situated at the south-east boundary wall of the dockyard, with which it will have means of egress and ingress for the convicts employed in that establishment; the site of the building being that formerly occupied by the Old Laboratory. It is constructed to accommodate about 1000 prisoners; and the object of this substitution of a prison for hulks is understood to be the necessity for exercising a larger amount of discipline and authority over the convicts than is possible on board ship. The arrangements on board the latter do not prevent communications being carried on between the inmates of the different cells; consequently very serious organisations and *émeutes* have frequently arisen, which required a strong military force to quell. In the new prison each convict will be completely and effectually separated from all communication of any kind with his fellow prisoners, whilst any one of them inclined to be refractory will be under the complete control of the officers, and so be subjected to the requisite punishment without hindrance or annoyance from others. The cells being well ventilated, and every other regard being paid to good sanatory arrangements, the prisoners will certainly be free from the unhealthy influences inseparable from living on board confined and damp hulks. Thus it is considered, that while the necessity will be met of really making the convict's term of imprisonment what it is designed to be—a punishment—by means of strict discipline and full control on the part of the officers, on the other hand he will be freed from the pernicious conditions in which he is at present placed.

The above are the alleged reasons for this change in convict location, but by some it is believed to be only the commencement of a comprehensive plan for meeting the difficulties arising from the objections of the colonists to convicts being sent amongst them, by establishing a series of convict prisons or "homes," as they have been called, throughout this country, for retaining felons in.

The plan of the new building comprises an east and west wing, between which are situated kitchens, cooking, washing, and other domestic offices. To the north of these is a chapel, and to the east the residence of the governor, chaplain, and other officers. The whole of the buildings are of brick, and are surrounded by lofty walls. The walls of each wing are roofed over with slates, having a range of skylights on each side. Down the centre of each wing is a spacious corridor, having the prisoners' cells on either side and opening into it: the west wing is 222 feet long, the east wing 236, both being 36 feet wide. There are four tiers of cells, each cell 7 feet by 4, and 7 feet in height, on both sides of the corridor. All the cells are fitted with a desk, for writing or reading, a seat, hammock, and shelves. The divisions between the cells are of a very simple, and, both as far as space and cost are concerned, of a very economical character, being formed of plates of strong "corrugated" iron. The ceiling of the under cell and the floor of that above it are at once formed of a plate of stout slate. The upper tiers of cells open on to light iron galleries, reached by flights of stairs of the same material. Some of the cells are supplied with light by glazed openings in the wall, whilst others derive it from the corridor. Warm air is forced into the corridors from proper apparatus, finding its way into the cells, and expelling any foul air that may be generated through apertures provided for the purpose. In addition to these cells there are 40 punishment cells in course of construction, each 10 feet by 6, and 9 feet in height. The contractors for the entire building are Messrs. Piper, of London, and the work has been carried on under the direction of Colonel Jebb, the Home-Office Inspector of Prisons. The immediate superintendence of the building has been confided to Mr. C. J. Woolcott, the Government clerk of the works. It has been constructed with great rapidity, not having been six months in course of erection; and by the 1st of October it is expected that the larger wing will be occupied by prisoners.

IMPORTATION OF RIPE PEACHES FROM NEW YORK.—It is well known that the United States produce immense quantities of that most delicious fruit, the peach, and, so far as we have heard, none have ever been brought into this country. A gentleman on board the *Cyclops* has, however, made the attempt, and, with some care, has succeeded in bringing them in a perfect state. He has brought them as a present to the family and friends of a gentleman farmer of this town, who may, therefore, claim to be the first importer of ripe peaches from the United States to England.—*Liverpool Mercury.*

CUTTING A CORPORATION.—It seems that the Great Northern Railway directors have given offence to the authorities at Huntingdon by hastening the Royal train so rapidly past that town on her Majesty's trip to Scotland. It appears that the corporation had prepared a congratulatory address to present to the Queen, and that the townspeople had made extensive preparations to testify their loyalty to the Crown. The Earl of Sandwich, the Lord-Lieutenant of the county, has been appealed to on the subject, and, by his Lordship's reply to the Mayor, it would seem that he was authorised to state that Her Majesty regretted that so much loyal feeling should have been rewarded by disappointment.

We learn from Constantinople, Sept 2, that the American frigate *Mississippi*, which had gone aground on entering the port of Smyrna, floated again on the 26th ult., and arrived at Constantinople on the 30th.

A return has been printed by the House of Commons, showing the number of convicts who arrived in Van Diemen's Land during each year, from the 1st January, 1823, to the 31st December, 1850, from which it appears that the total number was—males, 48,427; females, 9816. The number of emigrants to Van Diemen's Land from 1830 to 1837 was 14,115. The return of emigrants, including the wives and families of convicts, from Great Britain to Van Diemen's Land, from 1838 to 1850, was 5559.

At Ballincollig Powder-Mills (Cork), on Saturday morning, one of the corning houses blew up with a fearful explosion, by which a man was killed, and several dreadfully mutilated, one of whom is not expected to recover.

NEW ROUTE TO INDIA.

A SOMEWHAT startling announcement has just been made of a project for bringing London and Calcutta within seven days' journey of each other; and examination of the means proposed justifies our expectation that the consummation is not far distant.

The ancient route from England to India was round the Cape of Good Hope—a passage which was performed wholly by sea, and which generally occupied of late years about 100 days. In 1840, the first step of a new system had been taken by turning the course straight to the East at the Gut of Gibraltar, carrying it along the Mediterranean Sea, across the Isthmus of Suez, down the Red Sea, and so over the Indian Ocean to Bombay, or round Ceylon to Calcutta. Nor was this all; for by traversing France from Calais to Marseilles, the *détour* round Cape St. Vincent—a *détour* exactly resembling on a smaller scale that round the Cape of Good Hope—was altogether escaped, and the route assumed the appearance of a tolerably straight line from Calais to Aden. This gain had been effected partly by the division of the voyage into stages, whereby steam power became available, but more notably by the substitution of overland cuts for long sea circuits. Thus, the cut from Marseilles saved the circuit round Spain, and that across Egypt the vast circuit round the Cape. Now, to put the matter concisely, this substitution of land carriage for water carriage is the one simple principle of the scheme before us, and the problem is nothing more than this—how to eliminate from the route between Marseilles and Calcutta those portions which are still performed by sea, and substitute instead thereof some means of transport by land.

The sea stages of the present route to India, exclusive of the trip across the Channel, are two—one from Marseilles or Trieste to Alexandria, and the other from Suez to Bombay or Calcutta. These stages constitute by far the longest part of the journey, being 9075 miles, performed by steamers, from which an average speed of some ten miles an hour is all that can be expected. The longer, again, of these two stages is that from Suez to Hindostan, as it includes a circuit round two sides of the triangular territory of Arabia. The first object, therefore, is to get rid of the *détour* by Aden; and this is to be done by carrying the passengers to the mouths of the Orontes instead of the mouths of the Nile, and forwarding them across the Turkish territory to Bussorah, at the head of the Persian Gulf. The railroad required for this purpose would run along the Euphrates Valley, and its length would not exceed 900 miles, whereas its completion would reduce the distance from Calais to Calcutta by more than *one-half*—by 20 days, in fact, out of 39! This project, it is conceived, could be accomplished in two years' time, and the route would then lie through Ostend, Trieste, by the Mediterranean Sea, to the Orontes, thence to Bussorah, and by the Persian Gulf to Bombay, where it would meet the Indian railroads now actually commenced, or by that time completed to Calcutta. We have thus got rid of the Red Sea circuit, and substituted a land route for 900 miles of the distance. There remains now the straight run from Bussorah to Bombay, and the circuitous reach from Trieste to the Orontes, to be commuted for the facilities of direct railway transit by land.—*Times.*

The engraved plan indicates by a dotted line the contemplated route from England to India; from London to Ostend, Cologne, Augsburg, Trieste, Constantinople, *viâ* Orsova, on the frontiers of the Turkish Empire, already decided on. From Orsova to Constantinople is only 345 miles. It is not necessary to occupy time at present in speaking of the country through which this line is about to pass, as that portion through Europe is already well known. The route through Turkey in Europe is feasible enough, and easily accomplished. The Turkish Government are most desirous to see this accomplished; and our Ambassador has more than adequate influence with the Sublime Porte to facilitate the arrangements necessary to the undertaking through the Ottoman dominions. The steam communication with the Orontes has been already more than once tried; and there is a regular line of steamers between Constantinople, Smyrna, Rhodes, Cyprus, and the coast of Syria. During the last three years, the trade, commerce, and passenger intercourse has more than exceeded the most sanguine anticipations of the various steam companies (Austrian and English) on that line.

The facility of making a railway along the valleys of the Orontes and Euphrates is admitted, and the rapidity of access to Bussorah by this route is already established. The country on either side is capable of great improvement; and the Turkish Government are fully alive to the importance of railways, and the advantages that must eventually result to themselves therefrom. They are now satisfied that the British Government would sustain their Imperial rights; and, as they have hitherto done in regard to the privileges of transit through Egypt, they would feel in honour bound to secure to Turkey her rights as the governing power; and the requisite arrangements between the respective powers could be easily agreed upon. Little or no outlay would be required as regards the purchase of the country through which the line would pass, with the exception of some small tracts of country in Turkey in Europe and near to Constantinople, and

TOWN AND FORTRESS OF ORSOVA

the Imperial Divan would gladly forego its own right to indemnity in any Royal property through which the line may run, both in Turkey in Europe and Asia. From Bussorah the line is open for steamers by way of the Persian Gulf to Bombay and Calcutta.

THE ILLUSTRATIONS.

THE BAY OF ANTIOCH.

We cannot better describe this point of the new route than by quoting the letter of Dr. Thompson to the *Times*:—

"Sir,—It will probably interest those of your readers who take any concern in the above route, to learn that the past and recent reports from the officers commanding her Majesty's ships on the coast of Syria are all and each of them very favourable, and speak in the most encouraging terms of the site and advantages of the Bay of Antioch, and of the superior quality of the water that is obtainable in abundance at the ancient Posideum—a fact the verity of which I can corroborate from a residence and personal examination. The ancient port of Seleucia need require no additional proofs of its importance and capabilities, or of what it might yet become by a very small outlay in clearing away the entrance. 'The passage by the mouth of the Orontes,' say the above reports, 'possesses a grandeur rarely equalled even in the beautiful part of the country, Mount Casius rising abruptly from the sea, with its bold rocky pinnacle towering above the clouds.'

"It is fully anticipated from what has recently occurred, and from the inquiries and steps now being adopted, that Colonel Chesney's long-cherished project will, ere long, be in a measure at least carried out, though by railway, and not, as he anticipated, by steamers, thus verifying the prophesies and traditions of past ages, and, as the Rev. Dr. Keith says, 'proving that other witnesses are not wanting to rise their voice at last from that once frequented but long deserted shore;' and as if the very first fruits of the Euphrates expedition had been destined to be an offering to the cause of Scripture illustration by the concurring solution of another problem than that of the practicability of the navigation of the Euphrates.

"Colonel Chesney, in the 'Journal of the Royal Geographical Society,' commences an admirable article on the Bay of Antioch by a description of the scene that presented itself as the expedition under his command bore down upon the coast of Syria, in order that they might disembark at the very point which formed the ancient port of Antioch. He sought an entrance at that point in preference to all other places whereby to proceed to Beer, on the Euphrates. All the reports state that the Bay of Antioch is very spacious, free from rocks, and well sheltered on every side, with the exception of the south-east, where in the distant horizon rises the lofty island of Cyprus. The anchorage in the bay is, however, good, and the water deep almost to the very beach. Capt. Vansittart's report, which has just reached the Admiralty, speaks of the water at Posideum as the best on the coast; and states that the timber for ship and other building purposes found in the neighbouring mountains, and beyond the ancient Seleucia, is very abundant, and well adapted to meet all such demands. This was the spot selected by her Majesty's ship the *Columbine*, on the 3d of April, 1835, and followed by the *George Canning* under all sail, and which led the way from the offing towards the anchorage, for the disembarkation of the party destined to proceed on the expedition to the Euphrates. Colonel Chesney goes on to say:—'To the south, as we proceeded, was the lofty Jebel al Akrab (Mount Casius), rising 5318 feet above the sea, with its abutments extending to Antioch. To the north the Beilan range (5337 feet), well stocked with forest trees, chiefly oak, walnut, and fir; and in front the broad expanse of the bay, backed by the hills of Antioch, Mount St. Symeon, or Ben-Killeheb, covered with myrtle, bay, and arbutus, altogether forming a striking and magnificent panorama.

"It may be interesting to mention that this was the point fixed upon by Bonaparte when he purposed to proceed to the Euphrates. Colonel Chesney further states, that in 1811 Napoleon had prepared a fleet at Toulon which was to have disembarked a large force in this bay, and that M. Vincent Germaine was waiting at Antioch for the expected troops, which had, however, in the meantime, been marched to Russia, instead of, as was contemplated, taking the route from Suedia to India. The town of Marash was to have been the centre of Napoleon's operations, on account, probably, of the fine forests near that place; but, as the adjacent Beilan mountains would have furnished plenty of fine timber close at hand, it is not likely that this great General would have proceeded to Marash on learning that 110 miles through Antioch and Aleppo would have placed him at Beles, 200 miles lower down the river. There is reason to presume that Napoleon meant to carry his troops down the river to Bosrah, but the Russian campaign put an end to this.

"Who is to say but that even in our own day we may not hear of excursion trains to Palmyra, Bagdad, and the Tigris, by the Great Eastern Orontes and Euphrates Valleys line of railway, the stupendous aqueduct of ancient Seleucia forming a terminus with branch lines to Baalbec and the plains of Issus—the battle-field of Alexander and Darius. "Yours, &c.,

"5, Suffolk-place." "J. B. THOMPSON, M.D.

"The range of Rhosus and Amanus, or the Faunus, were believed by the Jews to be the Hor-ha-hor of Scripture; and were thus held by them to be the northern frontier of the land promised to their fathers. But, though Hor-ha-hor admits of a more precise definition, the idea that Amanus, which Jerome adopted, was the north border of Israel, is, as we have seen, warranted by many other facts.

"The mountains of Amanus, as Strabo relates, extend from the Mediterranean to the Euphrates. They formed the northern boundary of Syria, fronting Mount Casius, near the base of which is Laodicea, in the land of the Arvadites. The Amanus and Rhosus chains are nominally separated by the pass Beilan; but they are, in reality, continuous with one another, and are from 5000 to 6000 feet high, and snow clad till June and July generally. The pass of Beilan is 1584 feet high above sea level."—*(From Dr. Keith.)*

THE CITY OF BUSSORAH.

VIEW NEAR THE C[illegible]

ALEPPO.

Aleppo, or Haleb, in Arabic, is a city of 300,000, and the capital of Kinessrin; present population about 90,000. It is one of the best built cities in Syria, and presents at a distance a very imposing appearance, especially its citadel and tower. The view of the Mecca pilgrim caravan is at all times interesting. The pilgrims assemble once a year at Damascus, from Persia, Bagdad, Mesopotamia, and Turkey in Europe, and often number, when joined by the other great caravan from Cairo, as many as 80,000 and 120,000 people at Mecca. The pomp and great display of former days is annually diminishing. The nobles of Turkey went to Mecca formerly; now it is confined to the mercantile classes, who carry on a large tradefat the respective stations or stages on the

THE EUPHRATES VALLEY ROUTE TO INDIA.

ANTIOCH—FROM THE VALLEY OF THE ORONTES.

route. The caravans of some fifty years ago extended over a line of country for thirty miles.

ORSOVA.

Orsova lies on the frontiers of the Turkish empire, 345 miles from Constantinople; it has a fort with a lofty tower.

NEAR CONSTANTINOPLE.

This spot has already been decided on as the site of a station of the projected railway. In its immediate neighbourhood is an English factory.

BUSSORA.

The city of Bassora, Bussora, or Bosrah is in the government of Bagdad, about 70 miles from the mouth of the Shat-ul-Arat, on its western bank, navigable by vessels of 500 tons burden, and contains 70,000 to 80,000 inhabitants.

The English factory is considered the most beautiful building in the city, whose walls are washed by the river—circumference 7 miles, and 25 feet thick, mounted well with cannon.

SUEDIAH.

The valley of Suediah is thus mentioned in the *London Medical Gazette* for May the 9th of this year, page 807:—"Of the climate of Suediah, it is said that a more healthy or a more beautiful spot it would not be easy to find. The climate has been compared to that of the best parts of Switzerland in summer, or the south of France and Italy in winter. It is, in a word, a happy medium between Europe and Asia; and, for persons predisposed to, or suffering from, chest affections, it could not be better. We would refer to the Rev. Dr. Keith's work, "The Land of Israel," for more enlarged views and descriptions of the country along the Orontes and Northern Syria than our space will admit of. We would barely desire to point out the different views as now given, and refer our readers to any gazetteer for more minute and particular accounts than we can be expected to give to each respectively. The Orontes and Antioch, and their associations, sacred and profane, are such that we are satisfied the majority of our readers will examine for themselves all the sources from which they can be further informed a ; to their respective claims on the attention of every one professing the name *Nazarene*.

ANTIOCH.

Antioch the ancient Orontes, lies 46 miles west of Aleppo, and 22 due south of Scanderoon, or Alexandretta, on the gulf of the same name. It belongs to the Pachalick of Aleppo, and stands in the valley of the Orontes, which here forms a fertile plain, about 10 miles long and 6 or 6 broad. Part of the immense walls of ancient Antioch still remain; and though fallen from its ancient importance, this is still one of the large towns of Syria. The air is reputed to be more salubrious than that of Aleppo. The view of the plain of Antioch from the towers is interesting. The northern portion within the ancient walls is filled with olive, mulberry, and fig trees; and along the winding banks of the river tall and slender poplars are seen. The chief street seems to have run towards the gate of St. Paul, which leads to Aleppo.

People who love to live well, and cheap at the same time, should go to Antioch. Mr. Neale, in his recently published work on Syria, states that he "tried to be extravagant at Antioch, but found it to be impossible—house rent, servants, horses, board, washing, and wine included—to spend more than £40 a year. Oh, that Antioch were London! Fancy 7½ lb. of good mutton for 1s! fat fowls for 2d. apiece 70 lb. of fish for 1s.! and all possible fruits and vegetables sufficient for one's household for 2d. a week! If we remember aright, the garden of Eden was somewhere near this place.

RE-ISSUE of the ILLUSTRATED LONDON NEWS. Vol. XVIII.

Just reprinted, the WHOLE of the NUMBERS from JANUARY 4, 1851, to the PRESENT TIME: in which will be found a COMPLETE HISTORY of the PROGRESS of the GREAT EXHIBITION in HYDE-PARK.

NO EXTRA CHARGE will be made for those Numbers, as Back Numbers, from this date, September 20th—any Number being obtainable at the original published price.

Orders received by all Booksellers and Stationers; and Post-office Orders or Remittances to be addressed to W. LITTLE, 198, Strand, London.

MARLBOROUGH COLLEGE.—The ANNIVERSARY of the CONSECRATION of the COLLEGE CHAPEL will be celebrated on MONDAY, the 29th day of SEPTEMBER, 1851.

The Collections at the Offertory will be devoted to a fund for beautifying the Chapel.

The hours of Divine Service will be:—Morning Prayer at 11 h; Evening Prayer at 7 h.

M. WILKINSON, D.D. Master.

The Master will be much obliged if such friends of the College as desire to be present will signify their intention to him some days before, that due arrangements may be made for their accommodation in the Chapel.

THEATRE ROYAL, DRURY-LANE.—Under the Management of Mr. THOMAS MCCULLUM.—Farewell Entertainments.—Last Week of one of the most successful seasons ever experienced within the walls of old Drury. The management takes the present opportunity of thanking the public for the unprecedented encouragement bestowed on the exertions of the American and French Squadrons, and begs to say that for previous engagements, would not have announced so hasty a departure. A lively recollection of the generous support they have met with throughout the whole season will not be retained by them during their provincial tour (visiting at no distant period, again to have the pleasure of making their bow before a London audience). Mr. Lee's first fashionable night will take place on THURSDAY NEXT, being set apart for the BENEFIT of Mr M'COLLUM, Jessee. Dress Circle, 3s; Boxes, 3s; Pit, 1s 6d; Gallery, 1s. Upper Gallery, 6d

ST. JAMES'S THEATRE.—KATE and ELLEN BATEMAN (from America) These extraordinary youthful Artistes will continue their unique representations at this theatre for a limited period, and will appear during the ensuing week in several of their most popular characters—Richard, Richmond, Macbeth, Lady Macbeth, Sky ock, and Portia; and also in the Farce of "The Swiss Cottage," and "The Spoiled Child," which continue to elicit the most unanimous and unprecedented applause.—Boxes and Stalls at MITCHELL'S Royal Library, 33, Old Bond-street; and at the Box-office

ROYAL PRINCESS' THEATRE, OXFORD-STREET.—On MONDAY, SEPTEMBER 22, THE GAMESTER, APARTMENTS, and the ALHAMBRA. The Love is a Maze. Apartments, and the Alhambra. 24, Town and Country. Honeymoon, and the Alhambra. (by the BENEFIT of Mr HARLEY). 25, The Wife's Secret. Apartments, and the Alhambra. 26 Twelfth Night, Apartments, and the Alhambra. 27, The Duke's Wager, Apartments, and the Alhambra.

ROYAL PRINCESS' THEATRE, OXFORD-STREET.—For the BENEFIT of Mr HARLEY. On WEDNESDAY NEXT, SEPTEMBER 24th, will be revived the Comedy of TOWN and COUNTRY, in which Mr and Mrs C Kean, Mr Harley and Mr Harley will appear. After which the HONEYMOON. The Duke, Mr C Kean. The Duchess, Mrs C Kean Jaques, Mr. Harley. To conclude with the ALHAMBRA; or, the Three Beautiful Princesses

ASTLEY'S ROYAL AMPHITHEATRE.—Proprietor and Manager, Mr W BATTY, who has the honour of announcing to his patrons that he must shortly withdraw MAZEPPA, owing to the production of his more extensive novelties, certain and convenience upon an extended a scale as to produce the same effect as upon a former occasion. During the Week, will be presented Lord Byron's drama of MAZEPPA; or, the WILD HORSE, for the 83d night! After which, Batty's unparalleled SCENES of the CIRCUS. The Whole concluding with an entire BALLET.—Private Boxes may be had and place secured at the Box office, from 11 till 4 daily.—Stage-manager, Mr T. Thompson.

BATTY'S HIPPODROME, KENSINGTON.—Positively the LAST WEEK but TWO of this favourite place of resort.—On MONDAY, and during the week, an entire change of performance daily, introducing Monsieur Franconi's troupe with his highly-trained steeds, and the wonder of the world, the Jumping Horse. On Thursday, September 25th, there will be a Day Fete, when the doors open at One o'clock, to commence precisely at Two. Illuminations after the evening as usual: doors open at Four, to commence at Five. Admission: Private Box, £1 1s; Reserved Seats, 3s; First Class, 2s; Second ditto, 1s; Pit, 6d

ROBIN'S LAST WEEK but ONE—M. ROBIN being compelled to close his first and successful season on account of previous provincial engagements.—32nd Appearance of M. ROBIN, the Illusionist, on MONDAY, at Eight o'Clock, they will repeat their inimitable SOIREES FANTASMENES et FANTASTIQUES. The Performance will commence with the Ventriloquial Entertainment, before her Majesty the Queen, in the Throne Room, at Windsor Castle, on the 25th of April.—Every Wednesday, at Half-past Two o'Clock. Admission, 1s; Stalls, 2s.

BOUTON'S DIORAMAS, ST. MARK'S, Venice, and FRIBOURG, Switzerland.—Just OPENED, at HUNGERFORD HALL, Strand, the above unrivalled DIORAMAS, which are exhibited daily at 1, 2, 3, and 4 p.m. Admission 1s. Reserved seats, 2s. Children and schools half price. Open from 10 a.m. till dusk. Application for the remaining stalls and counters to be made to Mr. R. Foure, Manager, Hungerford Hall

THE GREAT DIORAMA of JERUSALEM and the HOLY LAND; from drawings made on the spot by Mr W H BARTLETT, painted under the direction of Mr W BARTLETT.—An entire section of this great Moving Diorama is devoted to the Holy City, with its column and principal buildings, including Mount Zion, the Valley of Hinnom, Garden of Gethsemane, Valley of Jehoshaphat, Pool of Siloam, Mount Zion, Site of Solomon's Temple, Jaffa Gate, Tower of Wailing, and the Holy Sepulchre. The whole illustrated by the Author, and accompanied by grand Sacred Vocal Music. Only at the St. George's tabernacle, Hyde-park Corner.—Admission, 1s.; Reserved Seats, 2s.; Stalls, 3s. 6d. Daily, at 12, 3, and 8 o'clock.

SYRO-LEBANON COMPANY.—HOLY LAND DIORAMA, EGYPTIAN HALL.—The great original Dioramas of the Holy Land and Jerusalem Views of Syria, who exemplify the manners, customs, and melodies of that land. This is the Diorama painted from Easter-eve.—Daily at 3 and 8. Admission, 1s; Pit, 1s 6d; Stalls, 2s 6d.—Egyptian Hall, Piccadilly

THE NILE REOPENED at 53, PALL-MALL.—This Grand Moving Panorama is NOW EXHIBITING at the GALLERY of the NEW WATER-and its Manners and Customs. Daily at Three and Eight. Admission, 1s; stalls, 2s 6d. Schools and children half price

GALLERY of ILLUSTRATION, 14, REGENT-STREET.—The Diorama of the OVERLAND MAIL to INDIA, showing Southampton, Cintra, the Tagus, Malta, Gibraltar, Algiers, Bona, Alexandria, Cairo, Suez, the Red Sea, Aden, Point de Galle, the beautiful gateway, and the gorgeous interior), is exhibited daily, at 12, 3, and 8 o'clock, immediately previous to the ROYAL PALACE at WINDSOR GARDEN Admission, 1s., 2s. 6d., and 3s. Doors open half an hour before each representation.

GOLD from CALIFORNIA.—Exhibiting Daily, at 12, 3, and 8 o'clock, at the EGYPTIAN HALL, Piccadilly, the Grand Moving DIORAMA of the OVERLAND ROUTE to OREGON and CALIFORNIA, with real specimens of Gold and Mountain Gold direct from the mines of the Sierra Nevada. Displaying the entire first establishable night route through 45° miles of country, crossing the Rocky Mountains and the Sierra Nevada Mountains and Indian Districts of California.—Admission, 1s. Stalls 2s, 3s

PRINCE of WALES' BAZAAR and COSMORAMA, 207 to 209, REGENT-STREET.—A carefully selected AVIARY of NATIVE and Foreign Birds, &c., is now added to the many other attractions of this unique and fashionable BAZAAR, which is fitted up in a style of recherché taste never before attempted in this or any other country, together with a fine GALLERY of PAINTINGS for SALE, by the old and modern masters. Admission 1s. Free.

ROYAL CHINESE JUNK.—NOTICE. The Mandarin HESING, Acting Imperial Representative for China, continues to remain numerous honorable Visitors Daily, in his Saloon of Reception, on board the ROYAL CHINESE JUNK. The Mandarin throws open his Museum of Curiosities from One till dusk; and at given periods of the day permits the crew of Chinese sailors to give a grand Assault of Arms. In addition to a Chinese Ensemble. Admission, One Shilling

THAMES TUNNEL.—ENTRANCE at WAPPING and ROTHERHITHE.—Toll, 1d. each.—Number of Visitors last Week, 22,206. Number the last week, 43,905. Grand Total since the opening, 10,366,334.—In addition to the various attractions in this wonderful work of Art, 32 beautiful Paintings, 15 feet in height each, by J. M. Hopkins, have been introduced in the Arches or entrances.—16 at Rotherhithe and 16 at Wapping. The whole of the above to be viewed without any charge beyond the Toll of One Penny. Open 1 ay and Night.

By order of the Thames Tunnel Company,
W. W. MASON, Secretary.

Also on the Tunnel, Music by Steam, Concertinas, Glass Blowing, Working and Lifting of fancy articles. Stands for Refreshments, and a Room for Dancing Every Evening.

N.B.—The following conveyances to the Tunnel viz., Steam-boats from Hungerford, Waterloo, and Blackfriars Bridges, Temple Bar Pier, and London-bridge; Omnibuses to the Surrey, close to the Tunnel, from Gracechurch-street, every half-hour.

THE GREAT EXHIBITION AND THE ROYAL POLYTECHNIC INSTITUTION.—ALL the MOST INTERESTING OBJECTS in the GREAT EXHIBITION will, in turn, be LECTURED ON at the ROYAL POLYTECHNIC INSTITUTION.—The present Lectures are by J. H. Pepper, Esq., on the Application of Iron and Steel to the Manufacture of the Useful Arts; and by PROFESSOR ANDERSON, on the Application of the Electro-Magnetic Impulse for Mechanical Purposes. Series of Magnificent Dissolving Views illustrative of the Great Exhibition. The Microscope, Lectures on Chemistry, Optics, Mechanics, &c. &c. &c. The great economy of Gas. A Lecture on the Habits of the Industrious Flea, by Frederick Chatterton, Esq., with Vocal Illustrations. A Series of splendid Dissolving Views. Diver and Diving Bell. Admission, 1s; Schools, Half-price. Open daily from Half-past Ten till Five and every evening (one Shilling) from Half-past Seven till Half-past Ten.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The HUMAN GIRAFFE presented by the Governor of Kingston is exhibited DAILY, from TWELVE to SIX o'Clock; together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by his Highness the Viceroy of Egypt. The band of the First Life Guards will perform, by permission of Colonel Hall, at Half-past Three o'Clock, every SATURDAY until further notice.—Admission, ONE SHILLING, on Monday, SIXPENCE.

L'EDITION FRANCAISE.

ILLUSTRATED LONDON NEWS en FRANCAIS,

Renferme dans son Numéro de SAMEDI, 20 SEPTEMBRE, toutes les nouvelles les plus intéressantes dans la politique, la littérature, les arts, le théâtre, &c. On y trouvera aussi divers articles de critique et d'actualité, ainsi qu'une Chronique de l'Exposition.

Tout les Numéros qui ont paru depuis le commencement ont été réimprimés. On peut se les procurer séparément, ou réunis en une brochure, avec une couverture magnifiquement illustré. Prix du Cahier, contenant Douze Numéros et une magnifique Vue du Palais de Crystal tirée à part, 6 shillings.

Nota.—Les Propriétaires de l'ILLUSTRATED LONDON NEWS croient devoir faire observer ici, que le Journal Français publié sous le titre ci-dessus n'est point une traduction de l'Edition Anglaise, mais bien une publication avec rédaction toute séparée, et dirigée à Londres par des écrivains de la presse Parisienne.

THE ILLUSTRATED LONDON NEWS.

LONDON, SATURDAY, SEPTEMBER 20, 1851.

It has been announced, apparently on authority, by the official organs of the French Ministry, that the Governments of Great Britain and France have notified, or resolved to notify, to the Government of the United States of America, their determination to protect Spain from foreign aggression and dismemberment. It is scarcely probable, after what has happened in Cuba, after the melancholy but well-merited fate of Lopez and his buccaneers, and more especially after the firm stand which, at the eleventh hour, the Central Government of the Union has made to prevent the departure from New Orleans, New York, or elsewhere, of any further piratical hordes, with the concealed or avowed object of invading the territories of Spain, that the necessity for isolated or combined action on the part of the two great Powers will now arise; but it is, nevertheless, of high importance that the fact of their *entente cordiale* should be made thoroughly known in America. The ardour of insolent and inexperienced individuals, as well as of States or Governments that are in the same predicament, is always perilous, and may produce mischief in quarters where it is least expected; and anything that tends to cool such reckless hotheadedness is in the nature of a public benefit. The annexation and war party in the Union must be more reckless than we imagine them to be, if they will brave the consequences of the active intervention of two such formidable powers as Great Britain and France, backed, as they would assuredly be, by the public opinion of a large party in the Union. We therefore trust most sincerely, that on this point our French contemporaries will turn out to have been well informed, and that the blood of the misguided men who listened to the rash and wicked promises of General Lopez will be the last shed in defence of the annexation of Cuba. The Spanish journals, to whom we are indebted for this information, add that the assurance of the two great European powers will only be rendered to Spain upon condition that she redress the grievances of the Cubans, and reform the administration of the island.

We know not what credence is to be attached to this statement, but we think the two Governments will prove too wise to interfere in the internal affairs of Spain and her colonies. We may advise, and he who confers an essential service is allowed the privilege; but beyond advice and remonstrance we have no right to stir. Besides, we all have yet known to the contrary, the Cubans alone have sufficed to defend themselves against the pirates of the American slave states. If the Cubans require no other aid but that of their own strong determination to resist aggression, Spain may perhaps tell her friends to leave her to herself.

THE surplus talk of the Parliamentary session—that found no vent within the old building, which a few days ago was disposed of, from floor to tile, by public auction—is now being scattered over the provinces. Members are meeting their constituents, to explain or to justify their conduct in Parliament; to account for silence where a speech was expected; to explain an unlucky vote on the side which no one imagined they would ever take; to supply little awkward gaps in their legislative biography; to fill in the details which, perhaps, a cruel reporter, in the exercise of his wise discretion, did not allow to reach the world in the ordinary course of business; and to make things in general as comfortable as possible, with a view to re-election. The first two members who have appeared this year, in this particular capacity, are Mr. Hume and Mr. Disraeli; and, as the first fervour of the shooting season diminishes in intensity, we shall doubtless have many other legislators imitating their example.

Mr. Hume's address to the electors of Montrose says nothing very particular, beyond the fact that he does not expect that the little Reform Bill, which Lord John Russell has promised to give us as early as possible in the session of 1852, will be of much, if of any use, either to the country or to his Lordship's reputation. Mr. Hume, we are quite sure, does not stand alone in this opinion; and the concurrence which it will elicit will not, we dare say, be confined within the quiet limits of the ancient borough of Montrose. Mr. Disraeli's speech, as becomes a leader of a great party, is more particular and more ambitious. We gather some interesting information from the report of the proceedings of the Royal Bucks Agricultural Association, at which he was present, on Wednesday last. When Mr. Disraeli speaks, we may be sure that something will be uttered which it is worth the while of men of sense to listen to, either that they may agree with, or that they may refute a politician of so much energy and ability. Mr. Disraeli, while vindicating with much eloquence the character of British farmers from the charge brought against them, of being deficient in skill, enterprise, and industry, candidly admits that the system generally known by the name of the Protective system can never be brought back, unless it is the interest of all classes—at least, of all classes of importance—that that should be the principle which should regulate the national industry. He then proceeds to argue, that it is the interest of all classes that that system should be restored, unless the British farmer "be relieved from a load of taxation which overwhelms his energies, and curtails his enterprise." This load of taxation, as far as we can understand Mr. Disraeli, seems, in his opinion, to resolve itself into two separate and distinct items—local taxation and the malt-tax. By local taxation, Mr. Disraeli means the poor-rates; and he asserts that of this particular burden the farmers pay £6,000,000 more than they ought to pay He urges the farmers, instead of agitating for a restoration of the Corn-laws, to unite and vigorously demand a re-adjustment of the local taxation, and a relief from the £6,000,000 which he fixes as the amount of hardship they at present endure. There is not, we are sure, a Free-trader in the country who will not earnestly, and without *arrière pensée*, and with the sole view of discovering the truth, consent that this subject be thoroughly debated. If injustice be done to the farmer, the other interests of the country will not insist that the injustice shall be perpetuated. The case, however must be proved; and as yet Mr. Disraeli has signally failed in his efforts to make it good. He always forgets, moreover, when he asserts that the support of the poor is a national duty, that land is after all, the poor man's heritage; and that as a right of property in it is only conceded against the poor man because such an arrangement is found to be conducive to the general good and to the stability of society, the land thus monopolised by a few should in common justice pay a heavy tax to the support of the many. When Mr. Disraeli asserts that personal property, which now pays £5,000,000 out of the £13,000,000 derived from local taxation, should for the future pay £11,000,000 and land only £2,000,000, he talks at random. What the country wants is not a re-adjustment of poor-rates, but their diminution—a diminution which all experience shows to be most rapid wherever manufactures are in a flourishing state. The roadjustment which he proposes would, if practicable, benothing more than a game of hocus pocus, and farmers would be called to their cost, that, in placing undue burdens upon trade and commerce, they were only increasing pauperism, and that, as a last resource, the paupers would fall back upon the land. A national poor-rate, as we have on more than one occasion endeavoured to show, would be an example of legalised Communism, which would throw the glories of the French *ateliers nationaux* into the shade, and rejoice the hearts of M. Cabet and M. Proudhon, if it did not prove the first step to the downfall of England. As regards the Malt-tax, it is no more a question of Free-Trade and Protection than the Income-tax is; and if the Chancellor of the Exchequer will take it off, without saddling us with a perpetual Income-tax, we shall be very much rejoiced. But we doubt whether the farmers would approve of such an arrangement; and whether, if put to the point, they would not much rather have a Malt-tax to be paid by the beer-drinkers, than an Income-tax to be paid by themselves. But we are glad, for various reasons, that the situation of Mr. Disraeli is so strongly directed to the financial question. There is something wrong about the mode in which the national income, for general as well as for local purposes, is raised; and the more earnestly and systematically that financial questions are discussed throughout the country, the greater the amount of good that is likely to result to all classes and interests, whether they rely upon trade or upon agriculture for the means of subsistence. We want a thorough revision of our fiscal system; and the more zealously the farmers enter into it, the greater chance there will be that the subject will be forced upon the attention of this or of the next Administration.

MR. DISRAELI AND THE BURDENS ON LAND.

At the dinner given on Wednesday, at the George Inn, Aylesbury, on the occasion of the annual ploughing match of the Royal Bucks Agricultural Association, Mr. Disraeli repeated those views which during the last session or two, he has given expression to in Parliament, as to what should constitute the most effectual remedies for the depressed state of agriculture, which has been attributed by the hon. gentleman and his party to the withdrawal of Protection.

Re-adjustment of the local taxation of the country and the removal of all restrictions in the cultivation of the land, whether arising from the prohibition of certain crops, such as sugar and tobacco, or from taxation of produce, as in the case of the malt-tax, constitute Mr. Disraeli's remedies.

On these topics the hon gentleman observed—"There is raised in the United Kingdom by local taxation £5,000,000 per annum. When we complained originally of that great assessment, it was said that the land might pay a good deal of it, but not more than one-third. House property, it was said, and railroads, paid a great deal, and this was objected to by the statement of the case. This led to a further analysis of the question, and it then resulted that of the £5,000,000 of local taxation £2,000,000 arose from a limited class of the property of the country, called 'real property.' £2,000,000 was contributed by the land of the United Kingdom. That, as a general statement, no one contradicts. Now let me draw your attention to the present state of affairs. I will take the rental of the United Kingdom at £200,000,000 sterling. I am not sure that is rather an excess in my estimate, but I wish to state the case rather as against ourselves. There has been stated, and with considerable truth, a reduction in the rent of land, and such distress in Ireland, that perhaps that is rather a high estimate to take. Well, we have pretty good evidence that the general income of the country is £240,000,000 per annum: but I will take a very moderate estimate—I will take only the rateable and taxable income of the country, and I will take that at £50,000,000 per annum of rental is one-fourth, but I will say that it is only one-third of the income of the country. Then, if that £50,000,000, which contributes £2,000,000 of local taxation (now universally admitted for objects of general and public interest)—if that £50,000,000 of rental, which is one-third of the general income of the country, contributed that £2,000,000 of taxes for objects of common interest, it follows that two-thirds of £3,000,000—say £6,000,000—should not be borne by the land of this country. (Hear, hear.) That appears to me to be an arithmetical proposition which no one can impugn. It amounts to this, that the land of the United Kingdom is every year contributing for the advantage of the country, and for the maintenance of common and national objects, about £6,000,000 a year more than it ought. (Cheers.) Allow me to ask you, what is £6,000,000 a year? It is one-tenth of the rental of the country, according to the exaggerated estimate that I have taken. And when we read in the newspapers, and hear of the proprietors of land making allowances to their tenantry of ten per cent, received with as kind a feeling as it is granted and accorded with a kind feeling, both the person who grants and the person who receives feel that it is not equal to the occasion, even though that £6,000,000 per annum is equal to and often per cent. And actually the very persons who advise you to seek an adjustment among yourselves as a remedy for your present distress, and who tell you that a diminution of rent to the amount which is now common is a sufficient remedy for that local taxation which is supported by a system of taxation which every year unjustly levies from the owners and occupiers of the land a sum equal to one-tenth of the whole rental of the country. (Cheers.) If a fair and impartial adjustment of that local taxation took place, you, the owners and occupiers, would at once be relieved—by no sacrifice on your part, by no unity, but by the principles of political justice, of which we hear so much on all other subjects—by that extent. (Cheers.) When I see what an immense relief might thus be obtained on the very principle which your opponents are promulgating, I am surprised that any one should attempt to deprecate the efforts that have been made on your behalf on that subject. I am surprised that a man so able and earnest as Mr. Fleury should say that it was a mere question of 6d. in the pound in the county rate. It is no such thing; but to every tenant in England it is a question of 10 per cent. further reduction on the rent that he is paying. (Hear, hear.) There are other questions of equal interest and importance, which, even if we cannot bring back the old system of Protection, which the country alone can bring back, we are still bound to work for, without giving up our opinions to work for and to endeavour to achieve. I say, that we should not only obtain an adjustment of taxation, founded upon equality, but that we should free the land from all the unnecessary restrictions which are now kept up upon it to the great branch of the national industry, when we know that every other branch is free from them."

Amongst the members of the Association present were Mr. W. Lowndes, of Chesham, in the chair, Captain Vyse, M.P., Captain Grove, Mr. M'Queen, the Rev. C. E. Gray, the Rev. E. N. Young, the Rev. E. N. Coles, and other gent emen of the county.

Not 100 persons sat down to dinner, and there was a marked absence of distinguished persons. There were only some half-dozen magistrates out of upwards of eighty in the county, and four clergymen.

MARRIAGE OF DOM MIGUEL.—As certain rumours have during the last few days been in circulation on the subject, we think it necessary to state that a contract of marriage has been concluded between Dom Miguel Braganza and her serene Highness the Princess Adelaide Sophie Amelie Louise Jeanne Leopoldine de Lobkowitz Wartisden de Rhofort et Ronsberg, at Vienna, of the present, and only daughter of the late, Prince, by the Princess Marie Agnes Henriette de Hohenlohe Langenbourg

His Excellency the American Minister and Mrs. Lawrence are at present making a tour in Ireland.

Her Excellency the Baroness Brunnow and Mdlle. Brunnow have left Ashburnham House for Windsor, where they propose making a short stay.

The *Victoria Regia* water-lily continues flowering beautifully in the open pond at Messrs. Weeks' nursery, King's-road, Chelsea. The whole plant has a gigantic appearance, having twenty leaves, each leaf twelve feet in circumference, and the foot stalks thirteen feet in length. Several distinguished persons, amongst them Sir William Jackson Hooker, are of opinion that the plant grows equally well in the open air as under a glass structure.

METROPOLITAN NEWS.

BANK OF ENGLAND.—On Thursday, the quarterly general court of this corporation was held; Thomas Hankey, jun., presiding, who stated that the profits for the half-year ending August 30 amounted to £554,188, being £13,394 less than those of the preceding half-year. The amount out of which the dividend had to be declared was £3,565,984, enabling a dividend of 2½ per cent. to be declared for the half-year, leaving a "rest" of £3,057,613. After a short discussion, the dividend was declared, and will be paid free of income-tax on Saturday next.

SOUTH-EASTERN RAILWAY.—On Thursday the half-yearly meeting of this company was held at the Bridge-house Hotel; J. Macgregor, Esq., in the chair; when a dividend of 8s. (subject to income-tax) per £50 share was declared. In the course of the proceedings the chairman stated that the first six months show an increase of revenue of £25,000, or £135,000 against £110,000 in the corresponding period of last year. The dividend is to be paid on the 16th of next month.

HOLIDAYS AT LAW COURTS.—In consequence of the holidays in the Insolvent Debtors Court, which adjourned on the 8th of August, and will not be in full operation until November, unless the other commercial courts of the country, which are so arranged as to grave judge in Chancery, in Bankruptcy, and at Judges' Chambers, at least once a week, a formal representation has been made to the Home-office, showing that some prisoners for debt are detained for weeks for a formal discharge, not requiring a regular hearing, from the court. The Home Secretary has replied that he has no power at present to interfere to require a judge to sit at shorter intervals than three weeks.

THE STATUE IN CAVENDISH-SQUARE TO LORD GEORGE BENTINCK.—On Saturday, at the weekly meeting of the vestry of St. Marylebone, Henry Lewis, Esq., in the chair, a report was presented from a committee appointed as to the making of two crossings from Mollis-street to the garden in the centre of Cavendish-square, that the present crossing and gate might be remged from the centre, so as not to interfere with the status now about to be erected there to the memory of the late Lord George Bentinck, the inhabitants of the square or parties applying for the change agreeing to pay the cost of the alteration themselves. The report was adopted.

THE BLOOMER COSTUME.—On Sunday considerable amusement was occasioned to the numerous visitors in St. James's Park, by the arrival of a complete batch of "Bloomers," consisting of five females and two males, evidently moving in the upper class of society. Two of the ladies were French-women. They were certainly most elegantly attired, all the ladies being dressed alike, with the exception of the Frenchwomen, who were blue trousers, whilst those of our own countrymen were pink. The upper dresses fitted close to the waist, and were of rich brocade of white satin, and the covering for the head a sort of cross between a bonnet and hat, as it did not partake more of one article than the other. The only difference observable in the gentlemen's attire was their very short coats. The style of dress did not appear to be agreeable to the mob, for the "Bloomers" had scarce made their appearance before they were assailed with an unlimited quantity of coarse jokes from the bystanders, who called the "Bloomers" to the Haymarket and to Wardor-place, where the ladies entered a carriage that was waiting for them, and the "gents" walked off. The ladies were between twenty and thirty years of age, and evidently enjoyed the amusement. On Monday evening, a Mrs. Dexter delivered what she called a lecture in favour of the costume, at the Institution, John-street, Fitzroy-square, the former locale in one of the Chartist Convention. The price of admission was sixpence to the ladies, and threepence to the gallery; but so great was the rush when the doors opened, that the crowd completely carried away the men stationed to collect the halfpence, and hundreds gained access without payment. Mrs. Dexter was attired in a Bloomer dress, and appeared to be about thirty-five years of age. She spoke with the manner and bearing of a person accustomed to "the boards" of the minor suburban theatres. The tenor of her address was a commonplace defence of the dress she appeared to apprehend would be regarded as the impropriety of the new costume, and a deprecatory appeal against the sneers and insults which she anticipated might be visited on the wearers of the dress in the streets.

ROYAL MILITARY COLLEGE, CHELSEA.—The Commissioners of Woods and Forests have entered into a contract for the filling up of the two unsightly and offensive canals in the gardens of the Royal Hospital at Chelsea, and the space thus acquired is to be appropriated to the promenade of the pensioners. In addition to this, several acres of land, now in the occupation of the military authorities, are to be thrown open and planted as pleasure-grounds, which, when complete, will form one of the most pleasant and agreeable recreations which have been conceded by the Government for the public good.

VICTORIA PARK.—Considerable improvement has been effected in this park during the last few months, new walks and shrubberies have been formed, and a public gymnasium constructed, and the ornamental water much improved; and, by order of the Commander-in-Chief, one of the bands belonging to the household troops attends twice a week, the same as in Kensington-gardens. The Commissioners of Woods and Forests are now taking the necessary steps to construct a series of carriage approaches to the park, which bids fair to become one of the most attractive spots in the metropolis.

THE PRINTERS' ATHENÆUM.—The printers of the metropolis are making strenuous exertions to establish a literary institution under the above title, and have already received considerable encouragement in its formation, both from compositors and the trades directly connected with the printing profession, as type-founders, booksellers, engravers, letter-press and copper-plate printers, &c., the members of which are eligible. The object contemplated is to combine the social advantages of a club with the mental improvement of a literary and scientific institution, and to adapt them for the position and requirements of the working classes. All persons engaged in the production of a newspaper or book, such as editors, authors, reporters, readers, &c., although strictly not belonging to the printing profession, are competent to become members, and persons not so connected will be permitted to join the society upon their being proposed by a member. It is expected that the Athenæum will be opened previous to the commencement of the ensuing year.

BATH AND WASHHOUSES.—The parish of St. George-the-Martyr, Southwark, has for some time been in a state of agitation on the question whether baths and washhouses shall be established in it or not, one party of the parishioners contending that they ought, and another the contrary. Public meetings have been called by the latter, at which resolutions were adopted against the introduction of the Baths and Washhouses Acts to the parish, calling on the ratepayers to unite in opposition to such a scheme, on the ground that the erection of such an establishment would be productive of much annoyance and attended with vexatious and unnecessary expense to the ratepayers. To carry out the spirit of those resolutions a committee was appointed. A meeting, convened by the churchwardens and overseers, took place on Tuesday night in the school-room, Borough-road—Mr. John Wilson, churchwarden, in the chair. A resolution, urging the necessity of erecting public baths and washhouses in the parish, having been proposed, an amendment was moved that the consideration of the question be postponed "for two years." The party proposing the amendment were not actuated, they said, by any opposition to the erection of baths and washhouses, but solely by the feeling that the cost of the proposed buildings would fall heavily on the ratepayers, already too much borne down by their local burdens. To the erection of such structures by the joint-stock company they had no objection. The promoters of the object, on the other hand, were of opinion that the estimated cost of the building, amounting to £10,000 or £12,000 sterling, might be raised by loan at 5 per cent., payable in thirty years. The amendment and resolution were respectively put, when the former was carried.

EXTENSIVE ROBBERY IN MAYFAIR.—On Wednesday morning, at an early hour, some daring thieves effected an entry into the premises, 35, Curzon-street, Mayfair, and abstracted upwards of £200 worth of silver plate, great a han ramvant, about £50 worth of jewellery, a carriage clock, and a cash-box containing about £5/-. Directly after the robbery in Curzon-street, Mayfair, West, they effected an entry also, and stole about £100 worth of jewellery, getting clear away with their booty

FIRE AT THE EASTERN COUNTIES RAILWAY.—On Thursday morning, between three and four o'clock, a fire broke out in the spacious timber-yard of Mr. Robinson, adjoining the Eastern Counties Railway The flames spread rapidly in all directions. The several piles of mahogany and other timber, of which soon caught fire, threatened terrific consequences. The heat was so great, that the wires and posts of the electric telegraph were destroyed. A number of the bricks also fell from the crown of the railway arches. By a good supply of water, and the indefatigable exertions of the firemen, the conflagration was at length extinguished. The damage sustained is estimated at some thousands of pounds.

DISTRESS AND MELANCHOLY AFFAIR.—Two young women, sisters, who gave their names Sarah and Rebecca Sharp, applied on Wednesday to Mr. Tyrwhitt, at the Clerkenwell Police-court, under the following peculiarly distressing circumstances:—It appeared that the complainants were two of the servants from Trapston, Northamptonshire, and their master granted them a holiday in order to come to London to see the Great Exhibition. They left Trapston, accompanied by their brother, Amos Sharp, a journeyman mason, and her infant child, seven months old. On their arrival in London, they took lodgings at a house in Edborough-street, St. Pancras, and on Friday night they retired to rest with a view to attend the exhibition the following day. On Saturday morning, at about two o'clock, they were awoke out of their sleep by an alarm of fire, when they found the lower part of the house in flames, and they were nearly suffocated with the smoke. Being unable to save any of their clothes or property, they escaped with the greatest difficulty, leaving behind them their money and everything belonging to them. Anne Smith, their sister, who with her infant slept in an apartment in the upper part of the house, found it impossible to make her escape through the flames and dense smoke, and making her appearance at the window, she was urged to throw her infant out to the people below, and it was saved. The unfortunate mother then, in a state of the most frightful excitement, made the attempt, although the spectators endeavoured to save her, she fell with great force, and injured herself so severely that she was instantly conveyed to the Royal Free Hospital, Gray's-inn-road, where prompt assistance was afforded her by Mr. Lane, the house-surgeon, &c.; and she now lies in a very precarious state. They had lost everything they had, and were destitute, with the exception of what they then wore on their persons, which were the benevolent gifts of the inhabitants of the locality in which the calamity occurred; and the object in making this application, which they were induced to do through the friendly advice of others, was to solicit some aid to enable them to return to Trapston, Northamptonshire. Inquiries instituted on the spot by the officer of the court established the truth of the sad story, and Mr. Tyrwhitt intimated that they should obtain adequate relief.

THE DRAINAGE OF LONDON.—It will be remembered, that, at the close of the year 1850, the then existing Commissioners of Sewers decided upon a plan for the general drainage of London. This plan was divided into three portions, viz. the northern and southern sides of the Thames, and the West-minster division; and it comprised works of no ordinary magnitude, the cost of which was estimated at £1,080,000. It was the intention of the commissioners to commence the formation of the vast system of intercepting sewers without delay; but a serious difficulty has arisen, and one which, without the intervention of Parliament, will prevent them from doing more than executing smaller works, ancillary to the greater ones hereafter to be undertaken. The difficulty alluded to is the absolute want of funds, and the inability of the commissioners to offer such security as would enable them to raise the money, or even a portion of it. Under the old act the commissioners were empowered to rate a rate of 6d. in the pound yearly, on all the rateable property under their jurisdiction; but, during the last session of Parliament, Mr. Henley succeeded in carrying a motion for the insertion of a clause in the bill preventing the commissioners from raising a rate of more than 3d. in the pound. This assessment, if enforced throughout the whole of the district rateable to the commission, would produce only £163,000 yearly; but, as at present carried out, it produces about £40,000. This sum is very little more than is necessary for the present functions of the commission, viz. the formation of the smaller lines of sewers, the abatement of nuisances from open drains and defective repairs, gulding, &c.; leaving but a very small amount to be applied to the general drainage system. The commissioners recently attempted to borrow £80,000 on the security of the rates, and one of the principal insurance offices in London expressed its readiness to grant the loan; but, upon an examination of the security, it became evident that it was of comparatively little value, the proportion of the 3d. rate required by the commission for its active functions being so large as to leave a trifling residue. Applications were also made in other quarters, but with the like success. It becomes evident, therefore, that even if the whole of the money which the commissioners could raise were to be at once applied to the execution of the general drainage system—leaving uncared for the daily requirements of the metropolitan districts—these works would occupy a period of eleven years (as stated by Sir James Kennedy), and, in the meantime, the sanitary condition of the metropolis would be far from progressing favourably. If the balance remaining to the commissioners, after the due execution of all their minor functions, were to be applied, London would remain imperfectly drained, and the works performed so far distant for thirty or forty years to come. Under these circumstances, nothing effectual can be done until the assembling of Parliament, when some extended powers of rating and raising money must be granted to the commissioners or else the Government must take into their consideration the propriety of assisting the commission to obtain the necessary funds by those means and upon those terms of repayment which may be agreed on. The almost immediate result in the minds of the commissioners to commence the execution of their gigantic scheme without delay; but they are now prevented from doing more than merely keeping the sewers of London in as good a condition as possible, and forming new ones whenever they are required, in such a manner as to render them hereafter portions of the more comprehensive system. Under any circumstances—even supposing them most favourably for the formation of the intercepting conduits—which will be required to convey the 120,000 tons of sewage daily flowing under the city to the mouth of the river Rodling, the time required will be between four and five years; and the present daily saving from a single day's sewage, under the Sewers Act, will probably cause a much longer delay. It is the intention of the commissioners to perform the works by contracts for different portions of them. The sewage will be collected in enormous reservoirs at Barking-creek, to be discharged into the river at each period of the tide as will prevent its return to London, or to be disposed of, if practicable, for sewage manure, and thus converted into a source of revenue. There is little doubt of the great success, at any rate, of the last proposition, as offers have already been made to the commissioners to lease from them certain sewage out-lets, with the view of using the soil for agricultural purposes. Powers have to be obtained, because at this time of the present commission is limited, and as it is deemed expedient to bond their successors by any contract which might impede them in the free construction of the system of sewers. The recently-framed commission has, up to the present time, given unlimited satisfaction to the ratepayers by its effectual and prompt working.

PAUPERISM IN ST. PANCRAS.—The number of poor at present in the St. Pancras Workhouse is 1098—the number at the same period last year was 1178. The out-door poor on the parish books is 4132, for the corresponding time last year the number was 4747. The cost of each pauper per week is estimated at 2s. 10¾d., last year it was 3s. 1d., and next year 2s. 7d. The almost whole of the outlay is accounted for by the inmates receiving additional comforts, and being better cared for now than they ever were before.

FATAL ACCIDENT ON THE RIVER.—Early on Wednesday morning a shocking accident occurred at Blackfriars Bridge, unhappily resulting in the loss of three lives. An empty coal-barge was proceeding down the river, when owing to a dense fog and want of proper look-out being observed, she came in contact with one of the centre piers, immediately sank, and three men on board were drowned. The bodies have not yet been recovered

On Tuesday the Surrey Coroner held an inquest at Lambeth walk, on the body of Mr. Henry Appleby, aged 60, the receiver-general for the Earl of Mornington. It appeared that on Friday last Messrs. Amsinck and Matthews, the brewers, sent two men with a dray of beer, part of which was to be delivered at Mr. Lee's, an Brewery, a beer-shop in Lambeth-walk. While the men were busily engaged taking the casks into the cellar, a lad jumped on the back of one of the horses, and in an instant afterwards the animals took fright and ran away towards Dunghig-street. The deceased rushed forward with his walking-stick, for the purpose of stopping the horses and saving the life of the boy; instead, however, of being enabled to do so, he was knocked down by the animals, and the wheels of the heavily-laden vehicle passed over his body and killed him. The jury returned a verdict of accidental death, but they hoped the men would never leave their horses in future without some one in charge of them.

BIRTHS AND DEATHS.—The Registrar-General reports that in the week ending Saturday last, Sept. 13, 734 boys and 686 girls, in all 1429 children, were registered; the average of six corresponding weeks in 1845-50 being 1292. The number of deaths were 1026, being an increase of 55 upon the week. In the week ending Saturday last the number of deaths in the corresponding week of the ten years 1841-50 was 1104; or 1090 if we correct for increase of population and exclude 2865 deaths in the second week of September, 1849. In that week the cholera was epidemic. In the last week there was a death every ten minutes in London; but the population is now about 2,361,000, and the mortality is therefore at the rate of 1 in 2351 weekly. The births and deaths, and excess of the deaths by + 3; the population is increasing partly by immigration at the rate of 43,000 a year, or 800 weekly. 535 males and 491 females died. The ages of four persons were not reported; 198 only were of the age of 60 and upwards, 369 were in the prime of life, and 403 were children who had not attained the age of 15. Of the 1026 deaths, 723 occurred on the north, 304 on the south side of the Thames. 72 persons died in hospitals, 9 in lunatic asylums, 3 in workhouses, 5 in prisons; 7 in military and naval hospitals, and 5 in military and naval asylums. No persons died in the hospitals for foreigners. Diarrhœa, summer cholera, and fever are the prevailing diseases; fever is increasing; diarrhœa is slowly, diarrhœa suddenly declining. The deaths in the last three weeks were 28, 17, 17 from cholera, and 174, 192, 101 from diarrhœa. 24 men and women died of that painful disease—cancer, and 119 of consumption, and 31 of heart disease. 6 women died in childbirth. 69 violent deaths are reported.

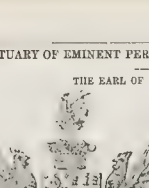
METEOROLOGICAL OBSERVATIONS.—At the Royal Observatory, Greenwich, the mean reading of the barometer during the week ending Saturday, the 13th of September, was 30.308 in. The mean temperature of the week was 57·1 deg.; the atmosphere was cold for the season, and 1·5 deg. less than the average of the same week in ten years. The lowest reading of the thermometer during the week was 37 5 deg. on Wednesday, the highest on Saturday, 72·4 deg., showing a range of about 35 degrees. No rain fell during the week. The mean direction of the wind was north-east.

The twenty-fifth anniversary of the coronation of the Emperor of All the Russias was celebrated on the 5th inst., throughout the whole empire, and in all countries where all the provinces associated with the Russian Emperor and Empress had previously arrived, and where cons derable military forces had been concentrated under the orders of Prince Paskewitsch.

NEW RAILWAY.—A railway scheme is announced as being in progress for the construction of a railway from the South-Western Railway, at Wimbledon, to the Brighton Railway at Croydon, and thence to Maidstone, to enable the South-Western Company to run trains to the terminus of London-bridge, and also to enable the London, Brighton, and South Coast Company to run trains to the Waterloo-bridge terminus of the London and South-Western Railway Company. The *Maidstone Gazette* says—"The project has the sanction of no ordinary character, being sanctioned by several large holders of Brighton and South-Western stock, who have secured the moneyed support of the principal landowners. The two companies are promised a clear gain of from £18,000 to £20 000 each, for the use of their present lines, besides a variety of facilities for their traffic, which will be mutually advantageous to both. The capital is to be £600,000, in £25 shares, total length 36 miles, estimated profit 5 per cent. The landowners, it is said, have agreed to identify their interests with the shareholders in the most substantial manner, by consenting to sell their land at reasonable prices, and by subscribing several thousand pounds to cover the costs of the application to Parliament in case of failure. The old idea of competing with the South-Eastern Company for the through Dover traffic and Tunbridge, appears to have been abandoned as impracticable, and the landowners have wisely determined to construct the line with a cheap line that will pay for local and agricultural purposes only. The line is not to cost more than £16 000 per mile, and one of the most tempting commercial features of the scheme is the prospect it holds out of permanent alliance between the Brighton and South-Western Companies. This line is to commence from a station on the east side of the Medway, south-eastern district. The local newspapers are again agitating the question of Parliament to accommodation between Strood and Canterbury, and between Rochester and Maidstone, and there is every probability of another effort being made next session to secure an extension of the North Kent line to Canterbury and Maidstone. It is stated that several large South-Eastern shareholders are prepared to sanction such a project under proper arrangements for working it in connexion with the existing lines. It is also stated that two of the most influential noblemen in the county have taken the lead in negotiating all preliminary details, and that one of them has accepted the office of chairman of the proposed company. The capital is £800,000; total length, 37 miles; estimated profit, 7 per cent.'

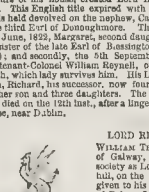
OBITUARY OF EMINENT PERSONS RECENTLY DECEASED.

THE EARL OF DONOUGHMORE.



The Right Hon. John Hely Hutchinson, third Earl of Donoughmore, Viscount Suirdale and Baron Donoughmore, of Knocklofty, in the peerage of Ireland, Viscount Hutchinson, in the peerage of the United Kingdom, K.P., P.C., Lord-Lieutenant of the county of Tipperary, and Vice-Admiral of the coast of Munster, was the eldest son of the Hon. Francis Hutchinson, third son of the Right Hon. John Hely Hutchinson, an eminent Irish statesman, by his wife Christiana, created Baroness Donoughmore in her own right. John Hely, third Earl of Donoughmore, was born in 1787; he passed some years of his earlier life in the British service, and rose to the rank of captain. Whilst in the army he acquired the appellation of "Lavalette Hutchinson," from the memorable and gallant share he took in furthering the escape of M. de Lavalette, Napoleon's Postmaster-General during the Hundred Days, who was sentenced to death on the return of the Bourbons, and who contrived to get out of his prison through the heroic devotion of his wife. Lavalette's subsequent flight from Paris to Mons, beyond the French frontier, was boldly and cleverly managed by Sir Robert Wilson, Mr. Michael Bruce, and Captain Hutchinson, the subject of this notice. The three were tried for the act, on the 22nd of April, 1816, at the Assize Court of the Seine, and sentenced to three months' imprisonment. Sir Robert Wilson, for having obtained a wrong passport to effect the escape, was struck off the British Army list; but the public subscribed several thousand pounds as an indemnification, and he finally obtained the restoration of his rank. Captain Hutchinson was also distinguished by his military services, having been actively engaged throughout the campaigns of Sir John Moore and the Duke of Wellington; by his literary success in his published account of the Egyptian campaign, under General Abercrombie; and by his parliamentary career when member for the city of Cork and the county of Tipperary. On the 29th June, 1832, he succeeded to the Earldom of Donoughmore, at the decease of his uncle, John the second Earl, the gallant General Hutchinson who took the command when Abercrombie fell in the arms of victory at Alexandria, and who, for his conduct in that campaign in Egypt, was, prior to his inheriting the honours of his house, created Lord Hutchinson, a pension of £2000 a year. This English title expired with him, but the family dignities he afterwards held devolved on the nephew, Captain Hutchinson, who consequently became third Earl of Donoughmore. The third Earl married twice: first, the 15th June, 1822, Margaret, second daughter of Luke, first Viscount Montjoy, and sister of the late Earl of Bessington (which lady died the 13th October, 1825); and secondly, the 9th September, 1827, Mary Anne, second daughter of Lieutenant-Colonel William Reynell, of Castle Reynell, in the county of Westmeath, which lady survives him. His Lordship leaves issue by his first marriage a son, Richard, his successor, now fourth Earl; and by his second marriage, another son and three daughters. The third Earl, to the regret of all who knew him, died on the 12th inst., after a lingering illness, at his residence, Palmerston House, near Dublin.

LORD RIVERSTON.

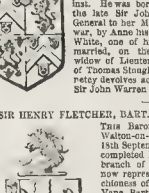


WILLIAM THOMAS NUGENT, of Palace, in the county of Galway, styled, and generally acknowledged in society as Lord Riverston, died at his seat, Riverhall, on the 6th inst. The title which he bore was given to his direct ancestor, the Hon. Thomas Nugent, of Palace, Lord Chief Justice, and one of the council, second Earl of Westmeath, by King James II., 3rd April, 1689, at a period when that Monarch had abdicated the throne of England, but was still, *de facto* as well as *de jure*, King of Ireland. Hence the descendants of the grantee have ever since maintained, that the peerage, being an Irish one, was legally conferred by James, who, to all intents and purposes, was the Sovereign of Ireland.

Lord Riverston, whose death we record, was possessed of a very considerable fortune, but his habits and manners were the plainest and most unostentatious. At the time of his death he had attained a very advanced age. He was eldest son of Anthony Nugent, Lord Riverston, by Olivia his first wife, daughter of Arthur Saunders Gore, 2nd Viscount Tyrone, county Galway, and grandson of William Nugent, Lord Riverston, whose father, the Hon. Thomas Nugent, of Palace, Lord Chief Justice of the Court of King's Bench in Ireland, was raised to the peerage, as we have already stated, by King James II., in 1689. Lord Riverston married, in 1794, Mary Catherine Bellew, aunt of the present Sir Michael Bellew, Bart., of Mount Bellew, and last issue daughter, John, Baron Dunsany, and two sisters, the Misses Plunkett, now styled Lord Riverston, who is married to Anne, eldest daughter of Malachy Daly, Esq., of Rosford, and Michael William Bellew Nugent, of Earl's Park, who married the only child of Charles Morrall, Esq., of New Hall, county Salop.

Lord Riverston was heir presumptive to the Earldom of Westmeath.

SIR THOMAS PELHAM HAYES, BART.



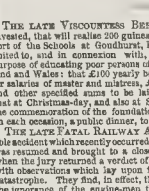
THE decease of this Baronet occurred at Dieppe on the 5th inst. He was born 18th November, 1794, the eldest son of the late Sir Edward Hayes, M.D., Physician-General to her Majesty's forces during the first American war, by Anne his wife, eldest daughter of the Hon. Henry Wynne, one of his Majesty's Justices of the Court. He married, on the 27th of June, 1840, Caroline Emma, widow of Lieutenant-Colonel Hill Dickson, and daughter of Thomas Stapleton, Esq., but had no issue. The Baronetcy devolves accordingly on his brother, now the Rev. Sir John Warren Hayes.

SIR HENRY FLETCHER, BART., OF CLEA HALL, CUMBERLAND.

THIS Baronet died at Ashley Park, his seat, near Walton-on-Thames, on the 6th inst. He was born 18th September, 1807, and had, consequently, almost completed his 44th year. His family was a junior branch of that seated at Cockermouth Castle, and now represented in the female line by the Marquioness of Londonderry, and Sir Francis Fletcher Vane, Bart., of Hutton Hall. Its immediate ancestor was Phillip Fleicher, Esq., grandson of Henry Fletcher, Esq., of Wentworth Castle, who had the trust of Mary Stuart when that Princess journeyed from Workington.

Sir Henry succeeded in 1821 to the Baronetcy, which was conferred in 1782 on his grandfather, Henry Fletcher, of Clea Hall, an East India director, and married, in 1834, Emily Maria, second daughter of George Brownlow, Esq., of the Rectory Civil Service, by whom he had several children, the eldest son being now Sir Henry Fletcher, 4th Baronet.

WILLIAM BUSFEILD, ESQ., OF UPWOOD, COUNTY YORK.

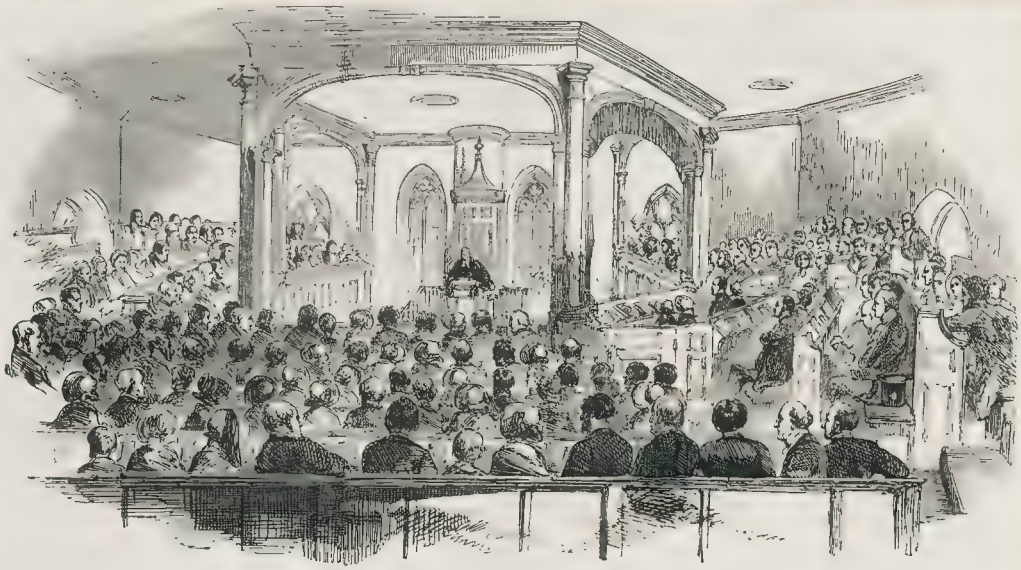


MR. BUSFEILD, who died on the 19th inst. at his residence, Bury-street, St. James's, in his 79th year, was eldest son of the late Johnson Atkinson, M.D., of Leeds, who assumed the surname of Busfeild, in right of his wife Elizabeth, only daughter and heir of William Busfeild, Esq., of Ilkyahworth Hall, an estate purchased by William Busfeild, who was Mayor of Leeds in 1673. The gentleman whose decease we record was a magistrate and Deputy-Lieutenant of the West Riding of Yorkshire, and had a seat in Parliament for the town of Bradford since 1837. He married, in 1800, Caroline, eldest daughter of Captain Charles Wood, R.N., of Bowling Hall, and aunt of the Chancellor of the Exchequer, but had no issue. His wife pre-deceased him in 1849.

In politics, Mr. Busfeild was an extreme Liberal.

THE LATE VISCOUNTESS BERESFORD has bequeathed a sum, to be invested, that will realize 200 guineas annually, to be held in trust in support of the Schools at Gondhurst, Kent, erected for boys, girls, and infants, united to, and in connexion with, the Incorporated National Society for the purpose of educating poor persons of the Established Church throughout England and Wales: that £100 yearly be expended in clothing for the children, £60 for salaries of master and mistress, £6 10s. in the purchase of books as prizes, and other specified sums to be laid out annually for general purposes; and that at Christmas-day, and also at St. Bartholomew's-day (24th August), being the commemoration of the foundation of the schools, the children are to have, on each occasion, a public dinner, to be defrayed out of the said annuity.

THE LATE FATAL RAILWAY ACCIDENT.—The inquest on the lamentable accident which recently occurred on the Buckinghamshire Railway, at Bicester, was resumed and brought to a close on Monday, the fifth day of the inquiry, when the jury returned a verdict of "Accidental Death;" coupling it, however, with observations which lay upon the company the whole responsibility of the catastrophe. They find, in effect, that the accident occurred in consequences of the ignorance of the engine-man that the train was to stop at Bicester, and that this ignorance was occasioned by the company's neglect to issue proper instructions. At the suggestion of the coroner, a recommendation was added that all the trains should stop at Bicester station.



INTERIOR OF CRATHIE CHURCH.

THE COURT AT BALMORAL.

AT Crathie, during the past week (says the *Aberdeen Herald* of Saturday last), we have been blessed with the finest weather seen at this season for many years. Her Majesty and the Court have been enjoying the pleasures of the country and of the season. The Queen has taken her customary drives, occasionally transferring to her sketch-book the objects which attracted her attention; while the Prince, like other sportsmen, has had his lucky and unlucky days. "Free from all the pomp and pageantry of state, the Royal Family appear to be healthy, comfortable, and happy, receiving, with much condescension, the respectful homage of their subjects, as they meet them in their rambles; enjoying themselves in acts of charity and benevolence, and securing to themselves the devotion, sincere respect, and good-will of all around them."

On Tuesday and Wednesday the accustomed drives and walks were enjoyed by her Majesty, while his Royal Highness was in the glen deer-stalking. On Wednesday the Duchess of Kent visited her Majesty at Balmoral.

On Thursday, the Queen enjoyed a drive by Ballater, &c., passing down one side of the river Dee, and returning by the opposite bank. Prince Albert went out deer-stalking, the Prince of Wales accompanying his Royal Highness to the forest.

On Friday, Prince Albert accompanied her Majesty in a drive to Ballater. The Prince of Wales and Prince Alfred were taken out early for their usual walking and riding exercise; and the Princess Royal and the Princess Alice accompanied their august parents in their drive to Ballater. The Marchioness of Douro, who has relieved the Countess of Desart in her duties as Lady-in-Waiting, was in attendance on her Majesty. The Royal dinner circle included the Marchioness of Douro, the Hon. Miss Byng, Colonel the Hon. C. B. Phipps, and Lieut.-Col. the Hon. Alexander Gordon.

THE ILLUSTRATIONS.

We have engraved a series of pictures from the neighbourhood of Balmoral, and of the Highland meeting at Braemar.

The first Engraving shows the interior of the Kirk of Crathie, where, on Sunday week, "her Majesty and his Royal Highness Prince Albert attended divine service. The ladies and gentlemen of the household were in attendance. The service was performed by the Rev. Dr. Macfarian, Principal of Glasgow University, and one of her Majesty's chaplains in Scotland."

The second view shows a portion of the estate of Birkhall, purchased by Prince Albert. This locality, and the scene of the third Illustration, were thus described in the account of her Majesty's recent arrival at Balmoral

"Crossing the water of Lochmuick, her Majesty came in sight of the hills of Lorimuir, on Prince Albert's estate of Birkhall. A very little farther on, her Majesty saw some of the new cottages Prince Albert has this year built for the accommodation of the cotters and labourers on his estate; and the fine new approach that has been opened up within the last few days to Birkhall. It appears to be scarcely finished yet, but quite fit for use. On Birkhall itself a number of improvements have been effected. The garden has been entirely remodelled, and several fine terraces, plots, and parterres introduced. It is at present tenanted by Sir James Clark, whose lady posted down to Ballater, previously to her Majesty's arrival, to assist in the welcome given to the Royal *cortège* in that village. Her Majesty then proceeded up the hill, through the woods of Knock, the timber of which is in a very thriving state and pretty large. The Royal *cortège* then entered Strathgirnock, on the estate of Abergeldie, of which Prince Albert has a 40 years' lease, and passed the site of the Castle of Strathgirnock, opposite the large bleak hill called Coylacreich. Near this point the water of the Girnock enters the Dee, and the view opens on the north side of the river to the hill of Morven, the top of which was shrouded in a dense cloud. The road then lay through fine groves of natural birch to Abergeldie. The Royal party next came upon the mansion of Abergeldie, on which many new improvements have been effected. The whole exterior of the building has been 'harled,' a new belfry erected over the clock, a convenient laundry thrown up near the house, &c. In passing the new Lochnagar distillery, the Clachinturin, and bridge of Crathie, the Royal party had an opportunity of observing the numerous new cottages that have been built by her Majesty this season for the benefit of the poorer cotters on her estate. Craigengowan, the birch-clad hill that surmounts Balmoral, and one of the most favourite walks of her Majesty was the next attraction. A small fog-house has been erected on it, for rest and refreshment."

Since her Majesty arrived she has visited the cottagers whom her bounty supplied with houses, and kindly inquired into their condition, examining very minutely whatever came under her notice.

THE NEW FOREST ACT directs—1. Within three months—that is, before November 7th next—the Commissioners of Woods and Forests are to give notice in the *London Gazette*, and in the Hampshire newspapers, requiring all persons to make their claims to right of common in the New Forest. 2. In not less than six months, or more than nine months, after such notice appears in the *Gazette*, the Verderers are to hold a meeting at Lyndhurst to receive such claims. 3. Claims not preferred at such meeting to be barred and extinguished. 4. A register of claims to be made out, and within one month after it is signed by the Verderers, an abstract to be printed in the *Gazette* and country papers. 5. Persons on the register may object to the names of other persons thereon. 6. Within three months after the register is printed, the Verderers to hold a meeting at Lyndhurst, to receive objections. 7. Copies of objections to be delivered to claimants. 8. Register of claims and objections to be completed within two years from the date of the notice in the *Gazette* to make claims. 9. All claims not objected to be good and valid in law and equity. 10. Certificates of unobjected and allowed claims to be evidence in all or any of the claims which may be preferred. 12. The Judge of the County Court of Southampton to hold courts, at places he may appoint, to decide on all objections, subject to the usual appeal against decisions of Country Courts. The decision to be evidence hereafter of the right of common allowed

Since the opening of the railway to Galway, that town has been visited by great numbers of the nobility and other persons of distinction, chiefly *en route* to the magnificent scenery of Connemara.

THE GATHERING OF THE HIGHLAND CLANS.

THE gathering of the clans in olden times was an event in the national history of Scotland. From the time the Earl of MAR raised the standard of rebellion in 1715, almost within gunshot of where Victoria now has her Highland home, down to the fatal battle of Culloden, the Highland clans were mustered in strong force when the signal was passed through the glens. Now, we have a "gathering" once a year in the "country of MAR," but the signal to rally is the olive branch, and the clansmen muster to show off their Highland dress, and disport themselves in harmless Highland games.

The gathering of 1851 was on Friday week. At early dawn crowds of pedestrians were to be seen wending their way to Castleton, most of them wearing the Highland dress. By nine o'clock, all sorts of conveyances, from the ricketty cart to the splendid barouche, were arriving in the village, and groups of the people were congregated at different points, some dancing to the music of the bagpipe, and some trying their hands at the caber or the stone.

About noon, the Duff Highlanders passed through the village, splendidly dressed in their clan tartans, and handsomely accoutered for the sports of the day. They were followed by the Duke of Leeds's retainers, a fine body of men, headed by the Duke as their chief, in splendid costume. Then came the men of Atholl, the Queen's body guard in Scotland, led on by the Duke of Atholl, and marching with music and banners. The clan Farquharson mustered strongly, and in their elegant tartans were greatly admired. They were headed by their chief, Mr. Farquharson, of Invercauld.

The place chosen for the games was a spacious lawn in the park, in front of the old castle of MAR—once the hunting-lodge of Malcolm Canmore. Here the clans formed into three sides of a square, each clan having its standard-bearer in position and its piper ready for the dance. The rear of the clans was flanked by the carriages of the aristocracy who are now in the district, and multitudes of the people who had gathered to witness the games.

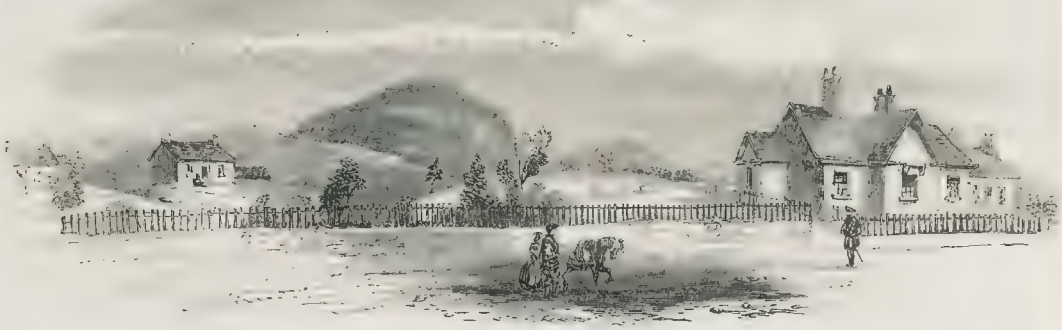
At one o'clock, the terrace of the Castle presented a brilliant display of beauty and fashion, among whom were the following:—

From Balmoral Colonel Phipps, the Hon. Alexander Gordon, the Hon. Miss Byng, Dr. Baker, and Dr. Robertson.

From Abergeldie Captain Couper, Lady Augusta Bruce, and Lady Frances Bruce.

From Invercauld—Mr. and Mrs Farquharson and family, their sons elegantly dressed in the Highland garb; Lord and Lady Charles Clinton; the Hon. Miss Murray, Miss Grant, of Congleton, and Miss Dalrymple, of Logie, Elphinstone.

From Mart Lodge—The Duke and Duchess of Leeds, the Duke and Duchess of Atholl, the Hon. Misses Lane Fox, the hon. Mr. Osborne, Captain and Mrs. Sutton, Rev. Mr. Hudson, Colonel Hudson, and Colonel Foster.



MODEL COTTAGES ERECTED AT CRATHIE, BY ORDER OF HER MAJESTY.

GRAND GATHERING OF THE HIGHLAND CLANS.—THE FARQUHARSON CHILDREN DANCING A REEL.

From Corriemulzie—Lady Agnes Duff and the Misses Duff and Master Duff, Sir James and Lady Catherine Carnegie, Sir Maxwell and Lady Wallace, Mr Brooke, Mr. W. Taylor. Mr John Blaikie, &c.

The Queen and Prince Albert sent a donation of £25 towards the prizes for the games, but, the Court being in mourning, did not honour the gathering with a visit. The Messrs. Duff, M.P., and Mr. Ricardo, M.P., who are at Corriemulzie, and other members of the Duff family, were absent out of respect for the memory of General Duff, who had always taken a lively interest in the Mustering of the Clans.

The games began about two o'clock, and for two hours the Highlanders distinguished themselves by strength of arm and agility of limb. A stone of 14 lb. weight was bowled as many yards with ease; a hammer of 16 lb weight was thrown 69 feet 11 inches; a pole or tree, 15 feet high by 6 inches in diameter, called the "caber," was poised with little effort and tossed right end over end. Reels, strathspeys, the sword and other dances, were danced as none but the Highlanders here can dance them; and a foot race of 1400 yards was contested by a dozen of gillies, the winner going over the ground in 5½ minutes. Formerly, the foot race was upon a steep hill, but the Queen having, with her usual consideration, suggested that this was rather a dangerous game, the stewards abandoned it for a race in the park, which was a most exciting scene.

The games being nearly over, a large party had luncheon in the Castle, which was tastefully decked with evergreens, monagrams of the Queen and Prince Albert being interwoven with festoons of heather-bell, the thistle, and the rose. Here, also, a ball was held at night, where the peer and the peasant mingled in joyous harmony; and thus concluded the Gathering of the Clans in the "country of Marr" for the year 1851.

Braemar Castle, the scene of these festivities, has a high bare-walled tower, with a venerable Flemish expression about it, though not dating back so far as "the '15." Immediately beyond is the Castle town of Braemar; and in the close vicinity are the remains, little beyond the foundation, of the old castle, where the Earl of Marr raised his standard of rebellion in 1715.

THE BALL IN THE CASTLE.—THE CLANS' REEL.

FREEHOLD LAND SOCIETIES.

In and around the metropolis these societies are making marked progress in public estimation, and consequent success.

On Tuesday last, the FINSBURY FREEHOLD LAND SOCIETY held a numerously attended meeting at the Star and Garter, Kingsland-gate.

This society, which has only been established ten months, takes for its model the society established at Birmingham in 1849, whose success is unprecedented. It numbers about 400 members, and £880 has been subscribed. Its object, in common with that of the other freehold land societies, is to confer on its members the privilege of a county vote, by enabling them to purchase, by small weekly subscriptions, a piece of freehold land, on which a residence may be erected, or a garden cultivated, either to let or to occupy. It proposes to purchase land in large quantities by the acre, to be divided into plots of an annual value of not less than 40s., and sold to the shareholders at the wholesale or cost price, thereby effecting a saving of from £30 to £60 on each plot. The investment is stated to be far safer than that of savings-banks, while the returns are considerably greater, in the proportion of 50s. to 12s. per annum on an investment of £20. Mr. Taylor, of Birmingham, the founder of those societies, was present and moved a resolution declaring that the society offered a safe and profitable investment to the working classes for their savings, and that it was entit ed to the support of the meeting. It had the advantage of being enrolled, whereby legal protection was secured to their funds, and they were exempted from the mortgage duty. In Birmingham the society had existed just four years; they had made 1100 allotments, they had 3004 shares, and had taken in one day last week nearly £10000. They had now near £20,000 worth of land ready to divide, which would make 700 or 800 allotments more. They had been ridiculed at first, among others by Mr. Newdegate, M.P.; but he had ceased to ridicule them now, for he knew he should lose his seat at the next election. Land, which was offered to them at £4 per yard, had since been bought by the society for 1s. 1d. per yard. (Hear, hear.) The estate had been allotted, and rose lot which cost £17 and been sold for £30. One man who had three lots, which had cost him £60, had let them off on a building lease for 92 years at a reserved rent of £8 14s. per annum. (Hear, hear.) One of the last estates they had purchased was in the borough of Birmingham; it cost the members 2s. 1½d. per yard, or £24 a lot, and the lots had let from 6s. to 8s. a year. The host le surveyor had stated in the revising barrister's court that none of this land was worth less than 3s. a yard, though it had only cost the members 2s. 1½d. The societies in Coventry and Wolverhampton had been equally successful. Another feature of these societies was the political one. He had now a vote for seven counties, and should possess other three next year. At the next election he should have the pleasure of voting either for or against Mr. Disraeli, if he stood again for Buckinghamshire. (Hear.) This was the reverse of all other movements in one respect, for it attained its object, not by expend ng, but by saving money. The Birmingham Society alone had created 600 county voters; let the London societies proceed in the same way, and they would soon be able to give notice to quit to those obstructors of improvement, the present county members. (Cheers.) The chairman's statement, that nearly a million of money had been subscribed by these societies was considerably under the mark: taking the average value of the shares at £30, the amount was nearly two millions and a half. (Hear, hear.) The resolution was agreed to, and the business coincided with the enrolment of members.

THE LAMBETH FREEHOLD LAND SOCIETY on the same day (Tuesday) co'ebrated a recent purchase of land by the society. The demonstration took place on the West Kent Estate, situated near the Forest Hill Railway Station. The society was established in October last; the number of shareholders is 600, by whom 1000 shares are owned. The estate comprises 38 acres, and is divided into 324 allotments, each allotment entitling the holder to a vote for the county. At four o'clock not less than 2000 persons were assembled in and around the tent. The band of the Royal Sappers and Miners was in attendance, and executed in a superior manner some excellent pieces of music. The company having perambulated the estate, assembled to the number of 200 in the booth, where a cold collation was prepared, and at which a number of ladies were present. An ox, which had been presented by Mr. Woodcock, the surveyor, was roasted upon the ground, and was distributed among the poor of the parish. George Singer, Esq., in the absence of Locke King, Esq., M.P., took the chair. After the usual loyal toasts were drunk, the chairman proposed the extension of the Freehold Land movement, and the Lambeth Freehold Land Society in particular." The object, he observed, of the important movement were to give to each individual the privilege of voting in the election of county members of Parliament, thereby helping to place the masses of the people in their proper position in society.—Mr. Hooper, in proposing the healths of the president, vice-president, and trustees, remarked that the manifold benefits resulting in carrying out one of the noblest political objects which could occupy the mind of a patriot, namely, to enable the masses of the people to exalt themselves of the privileges of the franchise. If properly carried out, it would do more, it would induce men, by habits of self-denial, to husband their means and obtain a stake in society: he would not say that it would make them more respectable, for true respectability consisted in the acquirements of the mind, and not in their pecuniary possessions. Property must, the freehold land movement would be the means of raising many from humble to better stations in society; and he, with all interested in this grand movement, hoped that it might be crowned with that success which all future ages in the cause of progress would bear.—Mr. D'Ifinger, in giving the "successful allotees," entered into some interesting statistics of the freehold land movement. He remarked that there were at present 480 Freehold Land Associations in England, with 190,000 shareholders, possessing 12,000 votes. Six years ago a vote cost him no less than £94; now, by means of these societies, every man who chose could become a voter by contributing one shilling per week, and becoming an allotee under a Freehold Land Society. But it was not enough that they should have the vote, they must have an addition the ballot, and by its means for ever put to end to intimidation and corruption. Other appropriate toasts followed, and a vote of thanks to the chair concluded the proceedings.

NAVAL AND MILITARY INTELLIGENCE.

REINFORCEMENTS FOR THE CAPE.—The authorities have ordered her Majesty's screw ship *Vulcan*, at Portsmouth, to have her powers and fittings expedited as much as possible, as the ship is required to convey a regiment of 6ds men to the Cape of Good Hope to reinforce Sir Harry Smith's army. The 43rd Light Infantry and the 6th Dragoon Guards are stated to be under orders for the Cape, and will, probably, go out by the *Vulcan*.

Lieutenant-General Sir John Burgoyne is making a most minute inspection of the state of fortifications in the Channel is ands and the western coast of England.

SIR JOHN ROSS'S TRAVELLING EXPEDITION IN THE ARCTIC REGIONS.—Captain Phillipps (rave led 31 days over Cornwallis's Island, but did not succeed in crossing it, but nevertheless his labour was very great, and Sir John Ross himself accompan ed the travelling party for fourteen days in the spring of the year, exerting himself in a surprising way.

RELIEF FOR SHIPS IN THE CHANNEL.—The following notice has been issued from the Admiralty:—"Admiralty, 16th Sept., 1851.—Sir, I am commanded by my Lords Commissioners of the Admiralty to acquaint you, for the information of the committee for managing the affairs at Lloyd's, that her Majesty's ships *Rolla*, at Portsmouth, and *Swinger*, at Devonport, as well as her Majesty's steam-vessel *Avon*, at the latter port, have been ordered to proceed to the Chess of the Channel, with as much provisions and water as can be conveniently stowed, for the relief of the homeward-bound fleets, and to remain in their respective ports when the wind comes to the westward.—(Signed) W. A. B HAMILTON. Captain G. A. Hulsted, R.N., Secretary, Lloyd's."

LIEUT.-COLONEL PRINGLE, has, without his having had any idea of the intention, been appointed Governor of Malta; he will thus be enabled to prosecute his inquiries into the law of storms in the Mediterranean, and to extend his communications with foreign captains upon the subject.

LIBERATION OF KOSSUTH.—A letter from Malta of the 12th conveys the gratifying intelligence of the liberation of Kossuth and his companions. They left Kutajah on the 1st and were conveyed from Ehrekoi to the Dardanelles in a Turkish steamer. Another communication says; "By the *Crocodile*, which arrived this morning, we have heard that Kossuth and his companions were all safe on board of the *Mississippi*, and that she had left the Dardanelles with them on the 7th for America."

THE CAPE MAILS.—The outward Cape mail screw steamer *Sir Robert Peel* broke down a few days before she got to Cape Lezzo, on the 6th ult., and so serious were her defects that she could not get away until the 18th. Indeed, from the accounts received, her own engineers could never have repaired her, nor could the engineers of Her Majesty's sloop *Alecto*, stationed at Gibraltar, then at S ara Leone; but happily, on the arrival of the *Hellespont*, the additional engineering assistance which that ship furnished completed the repairs, and, to the great satisfaction of the Admiralty agent, Commander Matwarkiet, she was pronounced capable of proceeding to sea. The chief engineer, however, of the *Hellespont*, in the trial of the machinery of the *Sir Robert Peel*, got his foot so fearfully crushed and the bone severed below the knee, that, on removal to the *Hellespont*, amputation was deemed advisable, and Dr. Finlay, of the *Alecto* (his assistant being present), performed the operation. On account of this misfortune delay at Sierra Leone will probably not expect the *Sir Robert Peel* to arrive in England at the usual time next month.

ARTIFICIAL LEATHER.—A steam-engine of six or eight horse power is erected at Abingdon, Massachusetts, for grinding up the chips and shavings of leather which are cut off by the shoe and boot makers, and which have heretofore been burnt or thrown away. These are ground to a powder resembling coarse snuff, and this powder is then mixed with certain gums and other substances so thoroughly that the whole mass becomes a kind of malted leather. In a short time this dries a little, and is rolled out to the desired thickness—perhaps one twenty-fourth of an inch. It is now quite solid, and is said to be entirely wa erproof.

The Lords of the Treasury have recently had under their consideration the subject of allowing foreign refined sugar to be shipped duty free for stores and have come to the conclusion that there is no necessity for the granting of such a privilege.

We read in the *Croce di Savoia*, of Turin, that a second coal-mine has been discovered in the island of Sardinia, at Santa Maria di Brabaui, ten kilometres from Gonessa; and that a third stratum of a quality much superior to that of the preceding ones has been found in the pit of Genessa.

THE CHESS TOURNAMENT.

Of the latest matches on the *tapis*, that between Mr. Horwitz and Bird has ended, after a spirited struggle on the part of the younger player, in favour of the former, who scored at the conclusion 7 games to his opponent's 3, while 4 games were drawn.

In the contest between Mr. Löwenthal and Mr. Williams, which has been unduly protracted and is still pending, the advantage up to the present time is on the side of Löwenthal; and of the match wherein the juvenile amateur, Deacon, has been pitted against the well-known divan player, Lowe, the former has already contrived to score 3 games to his adversary's 1.

Upon the formation of these battles, the latter will finally be wound up by three matches, in which the four most successful English players are expected take a part.

CHESS.

TO CORRESPONDENTS.

NEO BYTE.—1. The space allotted to Chess in the ILLUSTRATED LONDON NEWS is much too small to admit of analyses of Chess openings. We forward all such articles to the *Chess Players' Chronicle*. 2. Major Jenkins's book on the Fine and his old Chess problem-like contests of an elaborate study of some variations in the King's bishop's Gambit which, in conjunction with some few others, he has elected, Gambit player, he has worked out with remarkable ingenuity, and presented for publication to Mr. Staunton.

ARCHIMEDES.—We cannot undertake to answer Problem communications. The problem which he sent has been sent to Bristol.

SOUTH DEVON.—Many thanks; and Chess Club at Brighton, which assembles daily in the hall by locality of the Lewis Pier. We never heard of a Chess Club in Worthing. At Hastings, Chess is a pretty rigidly in the Library Institution.

E. B.—A King and two Knights on every square of the chess-board.

WHITELEAFE.—At the Lincoln Inn Chess gathering which is appointed to be held at Chester on Thursday, the 9th of October, amateurs of Chess from all parts of England will be admissible. Immediate applications for tickets, which are extremely moderate in price, should be made to A. B. Ellsworth, Esq., Gaiety, Lancashire.

M. P., Harrowgate.—The "Book of the Tournament" is being prepared for the press with all convenient despatch. It will contain a full history of the "opposition" to which you allude.

VOX O. Beri.—The last four Numbers (June, July, August, and September) have not yet reached us. Is the Post-office again in fault?

SOLUTIONS OF PROBLEM No. 396, by G. K. Peter, Tom Collis, M. D., St. Edmund, R. F., Bombardier.

GAMES IN THE CHESS TOURNAMENT.

BRILLIANT LITTLE GAME BETWEEN MESSRS. JAENISCH AND STAUNTON

(Scotch Gambit.)

WHITE (Mr. S.)	BLACK (Major J.)	WHITE (Mr. S.)	BLACK (Major J.)
1. P to K 4th	P to K 4th	12. Kt to K 5th	Q Kt to Q sq
2 Kt to K B 3d	Kt to Q B 3d	13. Q R to Q B sq (b)	P to Q B 3d
3. B to Q B 4th	P takes P	14. Kt to Q R 4th	Q to her 2d (c)
4. B to Q B 4th	B to Q Kt 5th	15. P to K 5th	P to K R 3d
5. Castles	P to Q 3d	16. Kt to K B 3d	P to K Kt 4th
6. P to Q B 3d	P takes P	17. P takes Kt (d)	P takes Kt
7. Q Kt takes P	Q B to K 3d	18. Q to Q B 2d	P takes P
8. B takes B	P takes B	19. Q to K Kt 6th (ch)	K to K R 2d (e)
9. Q to her Kt 3d	Q to B sq	20. Kt to K 8th (f)	Q P takes Kt
10. Q B to K 3d (a)	B takes B	21. Q takes K B P (ch)	
11. P takes B	Kt to K B 3d	And wins.	

(a) This appears a decided improvement on the usual move of Kt to Q Kt 5th, as it prevent the effective reply of Kt to Q 5th from the opposite side.

(b) Interesting, if not at least a Pawn, by playing Kt to Q Kt 5th.

(c) The only move to avoid immediate loss of Pawn.

(d) If Kt to Q B 6th would also have given White a fine attacking position.

(e) This move loses the game on the moment; but by playing Q to K B 3d, Black might still have made a long, if not successful resistance.

(f) After this, Black's game is utterly irretrievable.

BETWEEN MESSRS STAUNTON AND JAENISCH.

22. P to Q Kt 4th	B to Q B 3d	43. R takes R	K takes R
23. P to Q R 4th	B to K Kt 5th (d)	44. R to Q 8th	K to Kt 3d
		45. B to K B 4th	K to K B 4th

Drawn game.

(a) This is a novelty; at least, we cannot call to mind any book in which it occurs.

(b) The game now assumes an interesting aspect, and both attack and defence are conducted with great spirit and judgment.

(c) An all-important preliminary before advancing the K B's pawn.

(d) With the object of playing B to K Kt 5th, and then to Q B 6th.

(e) The position is now in Black's favour, as he threatens to move his K Rook to Q B 2d, and then advance the Q Kt P, threatening afterwards to take the K P with his Kt. To guard against these dangers, White is forced to capture the Kt.

(f) Black plays theoretically correct in thus uniting two pawns in the centre of the board; but in the present position, he would have done better, practically, by taking the Bishop with his Rook, and then playing K a Rook to Q B 3d.

(g) For a long time one leading object of White's game has been to keep the adverse Bishop restricted to an unimportant range of squares. The present move is made with the same view.

(h) This renders the projected march of the Black King into White's territory altogether unpracticable.

(i) Hazardous.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

An old man, named Mark Bassett, has been committed to Winchester gaol for the manslaughter of his son, aged 13. It seems that the unhappy parent threw at a waking-stick, which he held in his hand, at the deceased, with such force that the small end of the stick passed through the poor little fellow's hat, and entered his skull to the extent of some four or five inches. The wretched father was found sitting on the ground with his son lying across his legs in a dying state. The coroner's jury returned a verdict of manslaughter against the father, who is in his 65th year, and his agonies are so great that it is thought he will not live to take his trial.

A Polish journal, hailed the Chess, says:—"A great number of the shares in Mazzini's loan are in circulation at Posen. It is asserted that it is guaranteed to every person taking tares shares that his life shall be safe in the event of a revolution, and the possession of five shares will be a guarantee against pillage." What an attractive prospect takes "literators" hold forth!

The apple crop this year in Worcestershire is generally good, and in some places prodi.se. At the Pheasant Inn, Welland, there is a Kentish coddling, one branch of which, but two last long, has clustered upon it 33 apples, each apple being from 7 to 8 inches in circumference.

The Government has advertised for tenders for conveying the Australian mails in screw steamers, either of wood or iron, *viâ* the Cape of Good Hope, once every two months.

The Paris *Patrie* says, "It is in contemplation to form a line of railway which shall traverse France from east to west, beyond Lyons and Bordeaux."

For the last few days it has been observed that large pieces are seating off from the angles of the Egyptian Obelisk in the Place de la Concorde, Paris, so much so that the upper part, which was formerly quadrangular, is now becoming rounded. A large piece, nearly two metres in length, has also detached itself near the base, on the side towards the bridge.

Among the passengers arrived on Monday at Southampton from Cadiz is the *Arno* mail steamer, was a Spanish matador, or bull-fighter, on his way to South America, where he has an engagement for three years, to perform in the gladiatorial exhibitions in one of the South American capitals. The sum he is to receive for the three years is £4000. The sword with which he is armed won in conflict with the savage bulls, during the amphitheatre, is a heavy straight two-edged weapon, about 3½ feet long, with a red hilt, requiring for its use remarkable strength and dexterity.

From Hayti we learn, by the last arrivals, that everything was quiet in the political affairs of the island. The Emperor, with the army and squadron, was at Cape Haytien, on account of the report that a French and an English war steamer had put in there on the 11th for Cape Haytien.

Mexico, according to this week's accounts, continues in a state o. great disturbance. Congress was engaged in the discussion of the Tehuantepec affair without coming to a decision. A riot had taken place in Durango, caused by the scarcity of corn, in which four persons lost their lives.

The Pope has purchased all the things stolen by the Swiss radicals from the churches of Switzerland during the war of the Sonderbund. These precious objects have been deposited at the Vatican.

There are at present yachts belonging to no less than three foreign nations lying in Portsmouth Harbour, with their respective national colours flying. A French cutter yacht of 60 tons, belonging to the Duke de Cayine; a Neapolitan schooner yacht of 220 tons; and a Russian schooner yacht of 160 tons.

About half-past three o'clock on Sunday morning, a fire of an alarming nature broke out at the house of Mr. Hannah Nicholson, the Black Horse Inn, High-street, Rotherham, resulting in the death of the landlady and her grandchild

Mr. Richard O'Gorman, one of the oldest and most respectable merchants of Dublin, has left Ireland for the United States, with a capital of over £30,000. The exile of his only son, unfortunately led away by the Smith O'Brien mania of '48, who is at present a practising barrister at the American bar, has been the cause of Mr. O'Gorman's abandonment of his native land.

The Right Rev. Dr. Brown was installed as the new Roman Catholic Bishop of Southwark, on Sunday last, at St. George's Church. The installation took place in the presbytery instead of the church, and the only persons present were a few clergymen, who, after the reading of the papal Bull, did homage to their newly-appointed superior. Dr. Brown officiated at high mass, and in the course of a subsequent address to the congregation, craved their prayers, to enable him to discharge the serious and solemn responsibilities that devolved upon him.

An attempt is to be made to effect an entrance, and to explore the subterranean caverns or passage which exists under Taunton Castle, and which, by all accounts, leads from the centre of the town to Bal ce Hill, a distance of more than a mile. Several attempts have been made to accomplish the same object on previous occasions, but without success; and the present one is principa ly at the instigation, and will be under the direction, of the Somerset Archæological Society

The imports of grain into Liverpool from foreign ports during the past fortnight, although light, owing to the prevalence of easterly winds, are as follows:—93 733 bushels wheat, 62 bags do.; 31,322 barrels flour, 910 sacks do.; 200 bags farina, 100 barrels do.; 36,037 bushels Indian corn; 8400 bushels oats; 32 960 bushels beans; 8270 bushels peas; 598 boxes cheese.

A branch line of railroad is about to be formed by the Great Midland and Western Company of Ireland from Mullingar to Cavan, which will be a vast accommodation to that part of the country.

Professor Hodges, of the Queen's College, Belfast, has been named a member of the Royal Academy of Agriculture of Sweden, and also a corresponding member of the French National and Central Society of Agriculture.

The *Birmingham Journal* of Saturday says:—We are informed that the Hon. and Rev. William Towry Law, Vicar of Bamburgh, adjoining this town, and Chancellor of the Diocese of Bath and Wells, has resigned his living in the Church, with the intention of joining the communion of the Church of Rome. The hon. and rev. gentleman is the son of the late Lord Chief Justice Ellenborough, and brother to the present Lord Ellenborough. It may be necessary to state that the "opinions" of the Chancellor J. T. Law, so well known in connexion with the Queen's College, Birmingham.

Mr. E. Cresswell, of New Orleans, died lately, and by will emancipated his slaves, 51 in number; granting, also, sufficient money to each of them to ensure expenses into the free States.

The Scotch papers state that Father Gavazzi attended Divine service on Sunday in the Established High Church (Presbyterian), Glasgow.

Among the signs of the growing prosperity of the port of Gloucester is cited the increasing number of vessels that sail from it to various foreign ports. The number and tonnage of vessels, with car.-, coals, &c., for foreign ports to load port, during the last eight months, shows a considerable increase over the corresponding period of last year, the numbers being:—1850, 268 vessels—44,262 tonnage; 1851, 349 vessels—75,424 tonnage. The number and tonnage of vessels outwards, with cargoes for foreign ports, like wise increased, being, in 1850, 36 vessels—6004 tonnage; in 1851, 49 vessels—9794 tonnage.

A congratulatory dinner was given on Friday week to Sir William Johnson, the Lord Provost of Edinburgh, on his being raised to the dignity of knighthood. The Duke of Buccleuch, Mr. Cowan, M.P., Professor Buchanan, Sir James Forrest, Sir James Gibson, and several other distinguished local persons, were present on the occasion.

At the close of last week, information was received by the metropolitan police, that some daring thieves had effected an entry into the Mount Hotel, Lower Grosvenor-street, carried off a cash-box, containing three £10 and three £5 Bank of England notes, a canvass bag marked "Ransom," coin and cheques for £45. Also, from Oxford-street, a cash-box, containing £40 10s. in gold, and £4 in silver; from the Albion Tavern, Kennington-lane, a watch timepiece and other property; from the Edinburgh Castle Tavern, Samuel-street, Woolwich, a valuable watch, and 29 in gold, 9s. in silver, and a quantity of wearing apparel; and from the Black Boy Tavern, Dorset place, Trafalgar-square, a valuable watch and appendages, and some jewellery.

Accounts from the West of England represent the potato crop as being much affected by the mysterious disease which has attacked this plant during the past few years. The crops would, otherwise, have proved most abundant.

The *Pozzo di Borgo* steamer, of 80-horse power, plying between Bonifacio and Ajaccio, in Corsica, was last week lost within 500 yards of the shore, in the Gulf de Valesa. There were on board five men, constituting the crew, and twenty passengers, two of whom were colonial functionaries, Inspector-General of Engineers, and his aide-de-camp. The vessel was steaming along, when she suddenly struck, with so forcible a shock, that her keel opened, and the water poured in with great rapidity. One of the crew was drowned.

The Algiers papers relate a melancholy accident which recently took place on the beach of Mustapha. An order had been given on the previous night to the Colonel of the 5th regiment of the line, that the men should march down the next morning to bathe. Although the evening the night had become very rough, the order was not countermanded. At the roll of the drum the men went into the water, and in a few minutes a number of them were knocked off their feet by the waves. On the assembling of each of their comrades as were expert swimmers, they were all saved with the exception of five, who were washed away, and drowned.

A vessel arrived from New York has brought 1400 packages of butter as a portion of her cargo, the produce of the United States of America. This is the largest importation of butter which has taken place from the United States.

The *Edinburgh Gazette* of Friday week, contains twenty-three applications from Scotch proprietors for the advance of sums by way of loan under the provisions of the act 13th and 14th Vict., cap. 31, for the drainage of land.

It is said that France and England have come to an understanding on the Cuban question, and have not only agreed to make strong remonstrances to the United States Government on the subject of the piratical invasion of Cuba, but to hold a squadron ready each to support the rights of Spain, and that orders have already been given by the naval department in each country to this effect.

A tall fellow, who was dressed like a seaman, swallowed, the other day, at Liverpool, the whole stock of an oyster-seller, about 200, together with two quarts of milk and a glass of rum.

CHURCH, UNIVERSITIES, &c.

PREFERMENTS AND APPOINTMENTS.—The following preferments and appointments have recently taken place:—*Canonry*: The Rev. Henry Pratt to a canonry in Peterborough Cathedral. *Rectories*: The Rev. John Nibbs Garland to the rectory of St. John's, Jamaica: the Rev. William Wall to the rectory of Great Moulton, Norfolk; the Rev. M. Argles to the rectory of Barnack, Northamptonshire; the Rev. William Butterfield to the rectory of Application, Devon. *Vicarages*: The Rev. R. Lindsay Longbourne to the vicarage of Pirton, Herts; the Rev. J. S. Vaughan, to the vicarage of Stockland, Bristol; the Rev. J. Dillon Raven, to Woburn, Bedfordshire.

TESTIMONIALS.—The following clergymen have recently received testimonials of esteem and affection:—The Rev. J. James, from the pupils of the Bath Rectory Commercial School; the Rev. John Watts, head master of Louth Grammar School, from the scholars; the Rev. William Bruce, late perpetual curate of Stockton, from the congregation; the Rev. Dillon Raven, from the parishioners of Stalmes, Middlesex, on his departure from that parish.

DISCOVERY IN ST. PETER'S HUNGATE CHURCH, NORFOLK.—This small church, one of the oldest in the city of Norfolk, being built in 1468, is now undergoing partial restoration. During the progress of the workmen, on removing a quantity of boarding and matting from the south of the pulpit, discovered the remains of what was originally a very splendid, though small chapel, dedicated to St. John the Evangelist. The portions which have been laid open are a sedilia and piscina, a portion of the altar-stone, and the greater part of the canopy. The colours of the canopy and sedilia—gold, purple, and scarlet—are still very plainly traceable. In the chapel is also a monument to the Rev. Walter Paston, who died at Paston's Palace, in this parish, not many years after the erection of the church. There have been several restorations of less importance: figures of the Evangelists were found buried under a mass of rubbish in the south porch: they have been replaced, as well as a carved stone pedestal on which formerly stood the vessel containing holy water.

ETON COLLEGE.—The Vacation terminated on Monday, the 8th, on which day the school nominally opened. The collegers and lower opidans arrived on Saturday, to commence their studies on Monday, and the whole of the school will have assembled by Saturday next. Two additional assistant-masters have been engaged, as, in future, mathematics are to be taught as a regular and compulsory part of the school duties.

The Chamber of Deputies of Gotha, in a recent sitting, authorised the Government to conclude an arrangement with Prince Albert, fixing his income from the domains at 40,000 florins (about £3600) a year. The Prince at first had claimed 50,000 florins, and the Faculty of Law of the University of Heidelberg expressed the opinion that he was entitled to that sum; but he consented to reduce it to 40,000 florins.

On Monday, information was received that three convicts had succeeded in effecting their escape from the *Justitia* hulk, at Woolwich, by sawing a boat and rowing to the opposite bank, on the Essex shore. They were all under sentence of ten years' transportation, and were dressed in the grey convict suit. Their names are John Clark, convicted at Beverley, 2d July, 1850; James Carr, at Kingston-upon-Hull, 4th April, 1850; and George Hobbs, at Portsmouth, 22d July, 1850.

THE LOSS OF THE "PACHA" STEAM-SHIP.

On the subject of this melancholy catastrophe, we have received a letter from Singapore, of which the following is an extract:—

(To the Editor of the ILLUSTRATED LONDON NEWS.)

London Hotel, Singapore, July 30, 1851.

"DEAR MR. EDITOR,—I deeply regret to announce to you, for publication in your valuable and widely-circulated Illustrated Journal, the deeply deplorable circumstances of the total loss of the Peninsular and Oriental Company's iron steamer *Pacha*, of 600 tons and 210 horse-power, commanded by Captain Müller, which event took place on Tuesday night, the 22d inst., by coming into collision with the Peninsular and Oriental Company's steamer *Erin*, commanded by Captain Tronson, off Mount Formosa, in the Straits of Malacca, situated about 50 miles from Singapore.

"The ill-fated vessel, it being her first voyage on this, the China and Calcutta line, left Singapore at 1 P.M. on July 21st, bound to Penang and Calcutta, and were down headwinds for seven minutes after the coolie on took p ace, in twenty five fathoms water, when the *Erin* came in sight, and I have to report the loss of sixteen lives in the *Pacha*. The frightful catastrophe occurred about midnight in a clear night, and in water which is as much generally (as the sailors say) as a mill-pond.

"Among the unfortunate casualties on board the *Pacha*, were Dr. Briscoe, of her Majesty's 59th Foot, from China; and a M. Hardouin, a French gentleman from the Mauritius; two Chinese deck passengers from Batu, who had 800 dollars each with them (a Captain Cabaro, in K. M. 77th). Henry Grysdale, and Mr. Orton, the clerk in charge, besides ten of the European ship's company. Nothing at the time was saved from the wreck, and not a vestige of her now remains to be seen. Some thousand pounds of silk piece Chins goods and wearing apparel have since been found floating about in the sea, near the wreck, which were picked up by the captains of the *Leonets* and *Faize Alum*, who were, fortunately for themselves, proceeding in ballast to this port.

"Those who survived were brought back here in the *Erin*, some of whom are now in hospital recovering from the effects of so sad a disaster, which vessel arrived back here at 6 P.M. of the 22d inst. in almost a sinking state, the damage sustained by the collision, in which she cut the *Pacha* in two, severe damage to her bows, with the loss of her bowsprit, &c. She is now being repaired, however, and it is expected she will be enabled ere long to proceed *en route* to China with the mails.

"The postal communication between Calcutta and Singapore, and China and the intermediate ports, is consequently stopped for the present. A large portion of the up am on board the *Erin*, valued at eleven lacs of rupees, is considerably damaged by salt water. She is now unloading here, and she had on board 1150 chests, 1500 bales in quarter-bales, which she shipped in China, and 30,000 dollars taken in at Singapore before her departure for Calcutta.

"I have, sir, the honour to subscribe myself your most obed ent servant, C. H. BURT, Captain, 65th Regiment B.N.I., on leave in the Straits."

THE ARCTIC SEARCHING EXPEDITIONS.

In part of our impression of last week we briefly announced the return of the ships of the Expedition under Capt. Penny, bringing despatches to the Admiralty from Capt. Austin. Capt. Penny, in the *Lady Franklin*, parted company with his consort, the *Sophia*, in a gale of wind, but with orders for her to proceed to Wolstenholme. Captain Penny most fortunately fell in with her Majesty's steamvessel *Tartarus*, Lieutenant Commander Kisk, about twenty miles north of the Orkneys, and leaving the *Lady Franklin*, he proceeded in the *Tartarus* with all despatch to Aberdeen, which port he reached on Wednesday, and then came up to London by express train, and presented himself at the Admiralty on Thursday (last week).

The despatches are of too great length for us to print in full. They contain little to elucidate the grand object, beyond the confirmation of the discovery of Lo t three graves and the other traces on Beechey Island, Franklin's first winter quarters, known same time since. The shores of Wellington Channel appear to have been thoroughly explored in the months of April, May, and June, by various dog-sledge parties; and a vast expanse of open water having been discovered to the north and west, one of the parties went back to the ships, when, a boat-sledge having been prepared, they returned with it, and continued their examination; but the weather becoming boisterous, and their provisions failing short, they were compelled to return again to their ships in Cornwallis Island, where they had wintered, and which they reached on the 25th of July.

We quote the more important portions of Captain Penny's reports, and the despatches brought by him from Captain Austin, to accompany the map and chart, with which we have been favoured by the Admiralty. *(See next page.)*

Captain Penny's Report is dated from H M S *Lady Franklin*, Assistance Harbour, Cornwallis Island, April 12, 1851, and contains the following:—

"After parting company with her Majesty's ship *North Star*, on the 21st of August, I reached along the north shore of Barrow's Strait, until Sunday, the 24th, keeping a strict look out. Being then off Beechey Island, I spoke to the American schooner *Rescue*, and learned that her Majesty's ship *Assistance* had found traces of the Franklin expedition on Cape Riley. The *Assistance* was then running to the westward, and, anxious to be possessed of every particular, I followed her with the intention of going on board, but I had not that opportunity until two P.M., when both vessels were made fast to the land-ice two-thirds of the distance across Wellington Channel, the *Assistance* being about one mile and a half to the westward of us. Finding that the traces were apparently those of a retreating party, I thought it my proper course to return to the east side of Wellington Channel, which I accordingly did. The succeeding morning I landed with a party, and examined the coast from 10 miles to the northward of Cape Spencer to that promontory, and an encampment was found near the latter place, seemingly that of a hunting party about three years previous. Joining company with the *Advance*, the *Rescue*, and the *Felix* schooners, the following morning we made fast in a bight under the north-west side of Beechey Island, and, having consulted with Captain Dunbarton and Sir J. Ross, it was agreed that the former should despatch a party to continue the search northward along the east coast of Wellington Channel, while I explored the coast to the eastward. Meantime, a party of all my officers, which had been despatched in the direction of Cornwall's Tower, discovered the quarter which had been occupied by the vessels of Sir John Franklin's expedition in the winter of 1845–46. Three graves were also found, the headboards showing them to be those of three seamen who had died early in the spring of 1846; but, notwithstanding a most careful search in every direction, no document could be found. The same evening, a boat-party was despatched, under Captain Stewart, to explore Radstock Bay and its vicinity, but no further traces were found in that direction.

"The *Resolute* and *Pioneer* came up and made fast on Wednesday morning, and an unfavourable condition of the ice caused us all still remaining where water being opened to the westward I stood a certain distance across Wellington Channel in the morning, and sent away a party under Mr. J. Stuart to communicate with the *Assistance*, which was discovered in Barlow Inlet, Baring Bay, and the party returned the following forenoon, having accomplished upwards of 40 miles.

"By them we were acquainted that the *Assistance* had found no traces in about 30 miles of coast examined by her to the north and south of Barrow Inlet.

"The state of the ice prevented the least motion being made by the ships until Thursday the 5th of September, when we let Beechey Bay; but so little was the ice slackened off, that we were unable to reach the west side of the Channel before Sunday, the 8th.

"While lying under Beechey Island, arrangements were made with Sir John Ross to lay up the *Mary* yacht, and a quantity of provisions was contributed as our share of the *depôt* there formed.

"On Sunday, the 8th, I landed with a party about 12 miles to the northward of Barlow Inlet, and a cairn and pole was erected in a conspicuous situation. Wellington Channel being blocked up with old land-ice, no alternative was left us to prosecute our search, and, as a last resource, to cross Barlow Inlet, or attempting some other passage between the islands of the Parry Group, or, failing either of these, Melville Island. Following out this course, we pushed on through the bay-ice, which was now so strong as to resist us greatly. Even notwithstanding that obstacle, we reached Griffiths Island on Tuesday, the 10th of September, and having made fast there on account of the state of the ice, I had again a consultation with Captain Austin with a view to acting in concert.

"The following morn ng, the more favourable appearance of the ice induced me to make an attempt to reach Cape Walker; but, after proceeding 25 miles, the ice became packed, which, with a heavy ice, caused me to put about and make for our former position. The hourly increasing thickness of the bay-ice, which had now become such an obstacle that with a strong breeze the ship stayed with considerable difficulty, rendered it absolutely necessary that a place of safety should be obtained for the vessels, and I accordingly made for this harbour, a rough sketch of which I had previously obtained from the ice-master.

"We brought up at 11 A.M. on Thursday, the 12th of September, and shortly afterwards the *Felix* schooner, Captain Sir J. Ross, came in and brought up. Two boats were sent ashore and hauled up, to fall back upon, should further progress be made; but, being unable to get out by the 20th, so as to be usefully employed, preparations were commenced for wintering.

* * * * *

"Frequent communication has been held with Captain Austin's expedition, which has wintered in the strait between Griffiths and Cornwallis Islands, and arrangements were made with reference to the different routes to be taken in the coming travelling."

Captain Penny's report is resumed under the date Sept. 8, H.M.S. *Lady Franklin* at sea, stating, that, on the 17th of April, six sledges, with 41 officers and men, started from the ships, under the command of Captain Stewart, of the *Sophia*. The sledges were variously officered by Captain Stewart, Messrs. Marshall, Reid, and J. Stuart, and Drs. Sutherland and Goodsir.

"The course intended to be pursued was to proceed so far together up the west side of Wellington Channel, and, after resuming the *depôt* sledges, two parties to cross the east side of the channel, while the two other followed up the west coast to the head of the channel, the position of land then seen determining the ensuing travelling."

Sledges were prepared, and the day fixed for the start was Monday, April 14, should the weather continue favourable.

Captain Penny's report is resumed with the date Sept. 8, H.M.S. *Lady Franklin* at sea, stating, that, on the 17th of April, six sledges, with 41 officers and men, started from the ships, under the command of Captain Stewart, of the *Sophia*. The sledges were variously officered by Captain Stewart, Messrs. Marshall, Reid, and J. Stuart, and Drs. Sutherland and Goodsir.

"The course intended to be pursued was to proceed so far together up the west side of Wellington Channel, after resuming the *depôt* sledges, two parties to cross the east side of the channel, while the two other followed up the west coast to the head of the channel, the position of land then seen determining the ensuing travelling."

"Each sledge was equipped for 40 days, and the average weights per man were upwards of 200 lb. I started from the ship on the 15th, with the dog-sledges, which were manned by Mr. Peterson, and at noon, on the 19th, I joined the sledges. They had found the ice very heavy, in consequence of the recent snow and the high temperature, and their journey of the previous day had not exceeded 6½ miles. The feathered state of our cooking apparatus had already begun to cause much inconvenience."

Captain Penny then in eight a ten-ly return advisable; and having deposited the provisions and the two boat-sledges at a distance of 10 miles, they returned to the bay on the 20th. From thence to May 8th, more ample preparations were made; and on the 6th, after a short prayer to the Almighty to enable them to fulfil their duties, they started again in the sledges, in charge of Captain Stewart. The report continues

"At six o'clock A.M., on the 9th of May, I started with Mr. Peterson, and Thompson, one of the seamen, with two dog-sledges, the remainder being in the reserve k the parties, last camped at the further *depôt*. From Point Separation, in 75° 5 N. lat., Captain Stewart, with the auxiliary, Dr. Sutherland, and Mr. J. Stuart, of the *Lady Franklin*, left, proceeding up Cape Prince, and Mr. Stuart then separating and proceeding along the coast to Cape Hurd, examining the various beaches, &c., for further traces, as strong opinions were still entertained that more was to be found in that quarter.

"Mr. Goodsir, with Mr. Marshall as his auxiliary, had assigned to them to examine the west side, and to follow up a tr the dog-sledges, receiving final instructions on reaching the head of the channe. Rapid journeys were made with the dogs to Cape Dalhurst, in N. lat. 77° 21'. Hence the channel takes a N.W. ten miles, terminating in a point, afterwards named Point Decision, which was reached at half-past ten P.M., on the 14th of May. A mil. of 400 feet was ascended, and in consequence of the land being then continuously in a northwesterly direction, instructions were left to Mr. Goodsir to take the coast along to the westward, while I myself proceeded in a N.W. by N direction towards the land to the northward. At five P.M., on the 15th, we encamped on the ice, having travelled 25 miles N.W. by N. from Point Decision. The following day, after travelling 20 miles from the encampment in a N.W. by N. direction, we landed, at seven P.M., on an island, on an established latitude.

"Ascending a hill about 500 feet high above the headland on which we landed, the sea to the westward, in the strait between Cornwallis and Hamilton Island, was seen to be much despayed, and an island was seen to the westward, distant 10 or 40 miles. As the decayed state of the ice prevented further progress to the westward from this point, and no trace being found, we proceeded round the island, first to the S.S.E., and afterwards, on rounding Cape Surprise, in a N.N.W. direction. On the 16th we came upon what to all appearance was water; and, on landing on the 17th, at Point Surprise, we were astonished to open out another strait, by which we got clear of the land, an island was seen bearing W. ½ S., distant 40 miles; and a headland, distant 18 miles W. by N the dark sky over this head indicating the presence of water, to the extent of perhaps 20 miles, on the other side. This point was found to be in 76° 5' N. lat. and 95° 55' W. long. Further progress prevented by water, and we being still without traces, and the dogs' provisions being exhausted, no other course remained but to return to the ships, which we reached, after rapid journeys, at half-past two, on the 20th May."

The carpenters and people on board were immed ately set about preparing a boat to endeavour to reach the water seen. Every one on board continued actively employed, preparing the boat, provisions, &c.; and on the 4th of June the party started with one auxiliary sledge and one dog-sledge, the whole being in charge of Mr. Manson. No traces were fallen in with by either of the searching parties. The report continues:—

Resuming the boat journ-y, after separating from the fatigue sledges on the 11th of June, we proceeded about ten miles to the westward, when we were obliged to take shelter on an adjacent bay, in consequence of a hard sea and a rong wester y gale. From this date until the 20th July, 310 miles of coast were examined by the boat under very disadvantageous circumstances, arising from the constant unfavourable winds and rapid tides. Provisions being then within eight days of being consumed, and our distance from the ship such that prudence would not warrant further perseverance with the supply, we commenced our return, and, with a strong north-west wind, succeeded in reaching Abandon Bay in 15½ hours. The ice being so decayed as to preclude the launching of even an empty boat, we were compelled to haul the boat ashore and abandon her, taking with us four days' provisions. The weather during our return was boisterous in the extreme, with continued rain, which made the streams it was necessary to ford very rapid. The constant wet caused the most distressing discomfort; but from none of my men did I ever hear a com- ai. In 75° N. lat. we found a boat, which Captain Stewart had wisely sent out in case of such a contingency as had occurred, but the ice having set into the mouth of Wellington Channel, which had up to this time been open, we were unable to fetch her down further than Barlow Inlet. Thence we walked to the ships, which we reached at 10 P.M. on the 29th of July.

* * * * *

"On my return I was agreeably surprised to hear that Barrow's Straits had been open as far as could be seen since the 2nd of July, an occurrence which was so far to be expected as the strait was seen to be in motion till the 11th of May. The land-ice had also come out of Wellington Channel as far up as Point Separation, probably about the 5th of July; and on the 27th of July, when our travelling operations concluded, the fast edge in the channe. continued in the same position.

"The ship continued ice-bound till the 10.h of August; but had our parties returned in sufficient time to refit and be ready to cut out from the date of watermaking, we should have been at liberty on the 16th or 17th.

"On the 11th of August Captain Austin s ships entered our harbour in their progress to the eastward. His parties had penetrated as far as ships could hope to get, like our own, unsuccessful in finding the least trace of the missing expedition. In fact, none had been found since so would warrant the risk of a second winter, and, my orders being such as left no alternative, I determined on immediately returning to England, if no instructions to the contrary should be met with."

This was found to be the case. He parted from the *Sophia* about twenty miles off the island of Disa, and she not seen her after. Captain Penny concludes with an acknowledgment of the services of the various officers under him, as well as the seamen of both vessels; and, notwithstanding all the fatigue and privations they had endured, not a complaint or grumble was heard.

Next is Captain Austin's "Report of Proceedings.—HER MAJESTY'S ship *Resolute*, off the Winter Quarters of Captain Penny's expedition, between Capes Martyr and Hotham.—Aug. 12, 1851;" whence we subjoin extracts:—

"Captain Ommanney having examined Wolstenholme Sound, which proved to have been the winter quarters of the *North Star*, and completed the search of the north shore of Lancaster Sound and Barrow's Strait from Cape Warrender to Cape Walfoot, looked into Port Leopold, and then proceeded in further execution of his orders, the *Intrepid* having, in the meantime, examined Waxwell bay and Cape Hurd, finding at the latter place a record from the *Investigator*.

"Captain Ommanney, in the *Intrepid*, reached Cape Riley and Beechey Island on the night of the 23d of August, and at both found positive traces of the missing expedition.

"On the 24th, Captain Ommanney was joined by the United States schooner *Rescue*; and in the latter part of that day he despatched the *Intrepid* to search the shore to the northward, but she was stopped by the fixed ice about four miles beyond Point Innes.

"On the 25th a lead opened towards Cape Hotham; Captain Ommanney, hoping to find a record there, despatched the *Intrepid* to take advantage of it, allowing to the *Assistance*, Captain Penny, who had now arrived and communicated, remaining to search the bay, between Cape Riley and Beechey Island.

"The *Resolute*, having in hergearch been detained by weather, did not reach Cape Riley and Beechey Island until early on the morning of the 26th. She found between the latter and Cape Spenser, the *Felix*, Sir John Ross, the two brigs of Captain Penny, and the *Rescue*, Lieut. De Haven, and saw from the crowds on the *Assistance* and *Intrepid* on the opposite shore, near Barlow Inlet; the other United States schooner, *Advance*, was beset a few miles to the northward, with a searching party to Cape Bowden, where a bottle, scraps of newspaper, shot, and other miscellaneous fragments were found, conveying the impression that it had been the resting-place of a shooting or other small party.

* * * * * * *

"Previous to the arrival of the *Resolute*, Captain Penny had found on Beechey Island three graves and further conclusive evidence, which, the moment I saw them, assured me that the bay between Cape Riley and Beechey Island had been the winter quarters of the expedition under Sir John Franklin in the season 1845–46, and that there was circumstantial evidence sufficient to prove that its departure was somewhat sudden; but whether at an early or late period of the season, very difficult to determine.

"The immediate neighbourhood of Cape Riley, Beechey Island, and the coast of Wellington Strait, to near Cape Bowden, were satisfactorily searched, without any record whatever being found.

"On the morning of the 28th the ice eased off sufficiently to enable Lieut. De Haven to rejoin his consort round Cape Spencer.

"We continued boat-ut the evening of Sept. 7th, when the ice gave way to the northward, and carried us, in a critical position, out of the stra t to the south-east of Cape Hotham. This movement enabled Penny and Sir John Ross to cross the strait.

"Early on the morning of the 9th another chance occurred, when we succeeded in reloving ourselves from the ice, and with the brigs and schooners) gained the water between the pack to the southward and Cornwallis Island, then pushed onwards with raised hopes to the westward, steering for the southern extremity of Griffith Island, and sighting in the evening the *Assistance* and tender in that direction.

"On the morning of the 10th we joined company, as did the brigs, and in the evening the United States expedition. Captain Ommanney informed me that he had searched by parties on foot (unhappily, without finding any trace) the shores of Cornwallis Island, from six miles above Barlow Inlet to Cape Martyr; had found no traces of any party safe, eligible for winter security; and had deposited on Cape Hotham a *depôt* of twenty days' provision for unwty men, as also a small *depôt* on Griffith Island (since taken up).

"Having now seen the uncertainty of the navigation to the westward, and the necessity for measures of precaution and prudence, with a view to subsequent operations, I determined upon placing the *Assistance* and tender in winter quarters in the bay midway between Capes Hotham and Martyr.

"On the morning of the 13th, the weather having somewhat cleared, with the temperature down to near zero (*plus* 3°), we cast off. After much labour and difficulty cleared the bay and strea.n ice, and reached open water east of Griffith Island, when the United States expedition was seen to communicate with each other, hoist their colours, and stand to the eastward. The same evening we made fast to the fixed ice between Cape Martyr and Griffith Island, as the only place of finding security and gaining westing.

"On the morning of the 15th the *Assistance* and tender left for their winter quarters, the *Resolute* and tender remaining at the edge of the ice.

* * * * *

"We thus remained in the hope that the *Resolute* and tender might be able to advance until the 24th, when, from the state of the ice and the low temperature (*plus* 13½°), we were, after mature consideration, reluctantly compelled to give up all idea of proceeding further across, and to constant our energies to look forward to the security of the expedition. The bay ice having this day slightly caved off a short distance astern, we commenced to cut through the newly found pressed-up ice, about 300 or 400 yards in extent, and succeeded in getting the two in between the ice and the lane of water, with a view of reaching the small bay a little to the eastward of Cape Martyr; but the new ice again making every day, it was found impossible to relinquish the ship on the evening of the 25th."

The ships being fixed, Captain Austin dispatched travelling parties, with sledges and provisions, in various directions; but the weather becoming severe, with a temperature 40° below the freezing point (32° below the freezing point), they shortly returned, having only succeed ed in placing the *depôts*—Lieut. Aldrich on Somerville Island, and Lieutenant M'Clintock on Cornwallis Island, to the westward also—135 miles, but without discovering any traces. Lieut. M.cham found, in the bay intended for the winter quarters of the *Assistance* and tender, the expeditions of Sir John Ross and Captain Penny

"On the afternoon of the 17th Captain Penny arrived in his dog sledge, when the spring plans had been determined upon, Captain Penny undertaking the complete search of Wellington Straits. Thus ended the season of 1850. The expedition was now prepared for the winter.

* * * * *

"On the 18th of Feb, 1851, a communication was opened (by a small party from this expedition) with our neighbours to the eastward (temperature 69½° below the freezing point), and shortly after an interchange was made with Captain Penny of the detail of equipment for travelling parties determined on by each.

"By the 10th of March every arrangement had been made and generally promulgated for the departure of the spring searching parties as early as practicable after the first week in April. All appeared satisfied with the position assigned to them, and became alike animated in the great and humane cause.

* * * * *

"The weather becoming more favourable on the morning of the 13th (temperature 50° below freezing point), the whole of the sledges, fourteen in number, manned by 104 officers and men, and provisioned, some for forty, and others for sixty-two days, with an average dragging weight of 208 lb. per man, were conducted, under the command of Captain Ommanney, to an advanced position on the ice off the north-west end of Griffith Island, where tents were pitched, luncheons cooked, and all else required by myself: the highly satisfactory result gave me great confidence and hope. All then returned to pass the next day (Sunday) in quiet reflection and prayer.

"On starting on the 15th of April (temperature 14° below freezing point), the wind having fallen, and the temperature having risen to plus 18°, all proceeded to the sledges. On arrival, a short period was devoted to refreshment, after which all joined in offering up a prayer for protection and guidance, then started, with, perhaps, as much determination and enthusiasm as ever existed, with the certainty of having to undergo great labour, fatigue, and privation.

"The weeks of the limited parties returned at periods between the 27th of April and the 15th of May, unhappily without any traces. They brought in casualties of men from frostbite to the number of eighteen, one of which, it is my painful duty to relate, ended fatally. George S. Macoun, captain of the hold of the *Resolute*, a native of Dundee, whose death was attributed to exhaustion and frostbite, brought on while labouring as captain of the sledge *Excellent* (virtually, it may be said), died at his post. He was a most valuable and much respected petty officer, his remains are at rest on the north-east shore of Griffin Island.

"On the 23d of May Captain Penny reached the *Resolute*, and made known to the first party that he had discovered a large space of water to the westward, commencing about 70 miles north-west by N. to th of Cape Hotham. I much regretted that our remaining strength did not admit of my placing at his disposal sufficient to convey a boat, but he might entertain no matter and great.

"The extended parties returned unhappily, without any trace whatever—between the 26th of May and the 4th of July, in safety and good health, but reduced in strength and energies, and compelled to endure the effects of privation and fatigue. They were out respectively 41, 38, 60, 62, and (the Melville land parties) 80 days, some portions of which periods they were (from heavy drift) detained in their tents, with the temperature ranging as much as 69° below the freezing point.

"The extent of coast searched will be seen more readily in the accompanying outline of a chart." (See the Engraving.)

Captain Austin then refers to the privation, labour, and suffering experienced by all in this "extensive undertaking;" every officer reports the conduct of his men to have been most exemplary; and the crews are reported to have been animated by the example of the gallant officers, who were ever the foremost at the drag-ropes. The health of all the expedition on the 9th was highly satisfactory.

"Large caverns have been built and records deposited at Beechey Island, Cape Martyr, southern end of Griffith Island, Cape Walker, in latitude 77° 35' north, longitude 99° 25' west; and in latitude 76° 0', longitude 98° 0'. Printed notices have also been deposited on the routes of the severa searching parties."

Captain Austin concludes:—"Having maturely considered the direction and extent of the searches (without necessary that has been made by the sledging), and weighed the opinions of the different officers when at their extremes, I have arrived at the conclusion that the expedition under Sir John Franklin did not proceed to the southward of the sound at the south-east end of Wellington Strait; and having communicated with Captain Penny, and fully considered his official reply to my letter, relative to the search of Wellington Strait by the expedition under his charge (unhappily without success), do not feel authorised to prosecute (even if practicable) a further search in those directions.

"It is now my intention to proceed with all despatch to attempt the search of Jones's Sound; looking to their Lordship's intention, and to the impression that may now become strengthened with reference thereto, I have at the last moment the satisfaction of stating that we are proceeding under favourable circumstances."

OUTLINE OF THE DISCOVERIES MADE BY THE RESPECTIVE SEARCHING PARTIES FROM THE ARCTIC EXPEDITION UNDER THE COMMAND OF CAPTAIN PENNEY.

TRACK CHART, SHOWING THE EXPLORATIONS AND DISCOVERIES MADE BY THE SEARCHING PARTIES FROM CAPTAIN AUSTIN'S SQUADRON.

"PORTRAIT OF SIR FRANCIS DRAKE," PAINTED BY [illegible] PRESENTED BY SIR [illegible] TO THE UNITED SERVICE CLUB. (SEE NEXT PAGE.)

THE DONCASTER RACE PLATE, 1851.

The Doncaster Cup of this year is from the establishment of Messrs. Hunt and Roskell, New Bond street, is a fine work of art. On the cover is a group representing the sport of hawking, and around the body, in high relief, are two hunting subjects—the Boar Hunt, from the famous picture by Rubens and Snyders, in the collection of the Earl of Derby, who is one of the stewards of the race, and the Stag Hunt, from another picture in the same collection. The handles, which imitate oak branches, are made to spring from the landscapes of these alti-relievi, and the stem of the cup is decorated with implements of the chase. Around the foot are three racing groups in the

"RAISING THE MAYPOLE." PAINTED BY F. GOODALL.—(SEE NEXT PAGE.)

costume of the last century, the subjects of which are the jockey mounting his horse, preparing to weigh, and being led to the course. The whole is designed by Mr. A. Brown, and it certainly reflects credit on his taste and invention. The cup stands at least three feet high.

FINE ARTS.

PORTRAIT OF SIR FRANCIS DRAKE. PAINTED BY S. LANE.

THIS historically-interesting and fine Portrait of Sir Francis Drake, the skilful circumnavigator, and bold commander in Elizabeth's navy, was painted by S. Lane, Esq., for Sir Bourchier Wrey Pusher Elliott Drake, Bart., of Nutwell Court, Devon, by whom it was presented to the Senior United Service Club. It represents the great Admiral standing near a globe, on which he is resting his right hand; and as far as the middle of the figure it is copied from a fine original portrait by Zucchero, in the possession of Sir Trayton Drake. The Admiral is represented in all the glories of starched ruff and trunk hose, with a superb jewel round his neck, and a scarf of green silk richly embroidered with gold passing from his right shoulder to his left side, and in the chair in the back-ground is a very elegantly embroidered satin cap. Through an open window is seen a representation of the defeat of the Spanish Armada, in which Drake bore so distinguished a part; his heavy artillery is overcast, with the brilliancy of his fame was his end, after a long struggle with sickness and grief for his failure, in sight of Puerto Bello, which he had formerly taken and plundered. His body received a sailor's funeral

> The waves became his winding-sheet,
> The waters was his tomb;
> But for his fame his ocean seat
> Was not half lent room.

In painting the articles of personal wear and adornment, Mr. Lane had the singular advantage of copying the originals themselves, as they are treasured by Sir Trayton as highly valuable memorials of his renowned ancestor. The jewel and scarf were presented to Drake by Queen Elizabeth, tradition asserting that they were given to him on his return from his voyage round the world. The jewel consists of an exquisite cameo representing Europe and Africa, in an elegant mounting of rich enamel-work; and at its back is a fine miniature of Elizabeth. Other curious relics of Drake are preserved at Nutwell Court

Drake, our "Elizabethan Sea-King," was a native of the banks of the Tavy, in Devonshire; and Mr. Cressy, in his recent work ("Fifteen Battles"), relates the following pleasant anecdote of Sir Francis and the Armada. A group were assembled on the Bowling-green on the Hoe, in Plymouth, to look at the English fleet, with which they had just returned from a cruise to Corunna, in search of information respecting the real condition and movements of the hostile Armada. Lord Howard had ascertained that the Spanish fleet, though not yet to sea, were still formidably strong; and fearing that part of their fleet might make for England in his absence, he hurried back to the Devonshire coast. He remained his station at Plymouth, and there waited for the expected approach.

A match at bowls was being played, in which Drake and other high officers of the fleet were engaged, when a small armed vessel was seen running before the wind into Plymouth harbour, with all sails set. Her commander landed in haste, and eagerly sought the place where the English Lord-Admiral and his captains were standing. His name was Fleming; he was the master of a Spanish privateer, and he told the English officers that he had that morning seen the Spanish Armada off the Cornish coast. At this exciting information the captains began to hurry down to the water, and there was a shouting for the ships' boats; but Drake coolly checked his comrades, and insisted that the match should be played out. He said that there was plenty of time both to win the game and beat the Spaniards. The best and bravest match that ever was scored was resumed accordingly. Drake and his friends aimed their last bowls with the same steady calculating coolness with which they were about to point their guns. The winning cast was made, and then they went on board and prepared for action, with their hearts as light and their nerves as firm as if they had been on the Hoe Bowling-green."

"RAISING THE MAY-POLE." BY F. GODDALL.

"It was a great object with some of the more rigid among our early Reformers, to suppress amusements, especially May-poles; and these 'idols' of the people were put down in several shires. The Restoration of Charles II. was the signal for the restoration of May-poles, which were reared with great ceremony and rejoicing."

This very cleverly grouped and nicely painted picture admirably illustrates the above epigraph, extracted from the Catalogue of this year's Exhibition of the Royal Academy, where Mr Goodall's work was universally admired.

The scene is laid in an English village at the time of the Restoration, as denoted by the costume; the architecture of the house is likewise strict, characteristic. The varieties of personages introduced are well discriminated. Here we have the aged squire, his daughter and grandson; the belles of the village are waiting for the sending up of the pole, while the rustic youths round it chorden with May flowers are waiting to decorate the shaft, which the blacksmith and his assistants are raising; for which the party to the left are anxiously waiting—to begin the national pastime of the setting in motion. The accessories illustrative of the pastime of the scene are good, and the entire composition is charmingly arranged, whilst the colouring is soft and harmonious throughout.

THE GREAT EXHIBITION.

AGAIN the number of visitors seems on the increase; and, on Monday and Tuesday, upwards of 60,000 persons entered the Building. There is a marked difference in the character of the visitors on the several days of the week. On Mondays, the work ng classes of the metropolis form the majority of the spectators. On Tuesdays, those of the provinces and rural districts, are decidedly in the ascendant, and this arises from the excursion trains on the previous day. On Wednesdays and Thursdays the company is of a distinctly different order, being chiefly composed of the middle classes. The unanimity and thorough enjoyment which has prevailed all through, seems never to vary in the least, and, whatever the company may consist of, all goes on well and merrily.

In the latter part of last week, and the beginning of the present one, there was a very decided rise in the demand for season tickets. This arose from an impression that a closing order would take place on the 15th of October, and seems now to be confirmed by the fact that on Wednesday the sale of season tickets was closed altogether, by order of the Executive. A feeling seems rising in the public mind similar to that expressed by us in noticing the announcement as to the day of closing, that the work will be incomplete without some ceremonial of similar character to that with which the opening was inaugurated; and opinions in accordance with this idea are now put forth by our contemporaries. That the *élite* attendant upon the opening may be wanting we can readily conceive; but this is of little consequence, since it will be rather in a fitting conclusion to the magnificent ceremony of the 1st of May, than as a distinct manifestation. It will be, or ought to be, the thanksgiving for the success with which the work has been crowned, and which success was improved at the commencement.

The preparations for the removal, or rather the order for removal, are well nigh made. From the 16th to the 18th of October exhibitors will be permitted to remove any goods which will require a packing case, or packing within the Building; and the three days will be occupied in clearing for making-up space in the various localities. On and after Monday, the 20th, the work of dismantling and packing in the requisite cases will proceed as fast as possible, and every facility to be afforded to all who have business in the various departments, through the responsible officer. The Central Avenue once cleared, the work of removal will be comparatively rapid: the heavy machinery, however, will be got out at the end of the week. The whole work to be got through is one of no ordinary character, and the responsibility is very great, whilst the labour will be arduous, and the requisite supervision will be almost incessant.

The question of the appropriation of the surplus seems to create more and more sensation as the sum increases. Doubtless, the Royal Commission will see that it will be the most terrible mockery to apply it to use the money for purposes kindred to the Exhibition. This done, a great amount of positive good might be effected thereby; but, before finally balancing the account, her Majesty's Commissioners will do well to consider whether some public marks of approval ought not to be publicly given to those officers who have laboured so hard in this cause, in some cases without remuneration, and in others for such a stipend as nothing but their love of the work could have induced them to accept. The economy exercised was good and commendable at the outset; but, now that the work is brought to a successful issue, those who have made these remarks think that a few of the leading men without doubt will be considered, as entitled to the consideration of the body in whose hands are deposited so important a public trust. The justice of this is self-evident, that the real surplus can only arise after every one is amply rewarded for the toil, trouble, and anxiety, to say nothing of the serious abstraction of many from their regular pursuits, entailed upon all connected with the most marvellous and rapid achievement of modern times.

THE ARMY OF AUSTRIA.—A military report of the Austrian army has just been published, both in regard to its entire framework and internal arrangements. The army is placed under the immediate control of the Emperor, as commander in chief of all the troops under the central Government. The conduct of the separate divisions of the army is under four military commanders at Vienna, Verona, Pesth, and Limberg, with 14 *corps d'armée*, with the Ban as governor. The army comprises 7 field marshals, 25 appointed field-marshals and generals of cavalry, 108 appointed field-marshal and 130 major-generals. The troops consists of 3 regiments of guards, 63 regiments of the line, 20 battalions of grenadiers, 14 infantry boundary regiments, 2 battalions of Arabbers, 2 battalions of Tyrolese sharpshooters, 1 battalion of Croat brigade, 25 battalions of chasseurs in two divisions, five garrison battalions, and 4 disciplinary companies; 18 regiments of cuirassiers, 6 regiments of dragoons, 7 regiments of light horse, 12 regiments of hussars, 3 regiments of uhlans, 1 corps of bombardiers, 1 rocket corps, 5 regiments field artillery, 3 newly appointed battalions of fortress artillery; 9 naily, garrison artillery in 14 districts, the corps of engineers, with the Geographical Institution at Vienna; 1 corps of pioneers, 16 regiments of gendarmes, the marines, with corps of artillery infantry, the seamen, with the newly-created flotilla corps, 3 newly-created sanitary battalions, a messenger ride brigade, and a division of staff dragoons; finally, the police guard, with 14 divisions.

THE ILLUSTRATED LONDON NEWS.

MUSIC.

At the Whittington Club, last Monday night, the Metropolitan Classic Harmonic Society gave a concert of the "Melodies of all Nations." At the same room, on Wednesday, the Lyric, Madrigal, and Glee Club had their sixth evening musical entertainment, when Mr. Benedict presided. The principal singers were Messrs Wells, Cox, Budd, Dorrington; Messrs. Miller, Holmes, M. Smith, D King, Howe, J. Ball, Baraham, Buckland, and Lawler.

Signor Nicosia, a violinist under the patronage of the Duchess of Somerset and Prince Castelcicala, the Sicilian Ambassador, presented a *matinée musicale* at the Queen Anne-street Rooms, on Wednesday, with the accompaniment of Piatti (violoncello), Madame Sainville, Mdlle. Lavigne, Mr. H. Leigh, Signori Mariotti, Camparella, Chiarini, and Meras (vocalists), with Signor Piatti, as accompanyist.

At the Haymarket Theatre, this week, Bellini's "Sonnambula" has been given, with Miss Louisa Pyne, Messrs. Harrison and Weiss. We regret to perceive that the manager has so soon departed from the attempt to establish a lyric theatre, similar to the Opéra Comique in Paris, namely the production of original one, two, or three act operas, with spoken dialogue. After the very successful receptions of Mendelssohn's "Son and Stranger," and Mr. E. Fitzwilliam's "Queen of a Day," there is every inducement for the Haymarket lessee to persevere in the effort to bring forward novel works, instead of falling back on the hackneyed Italian *répertoire*

The Italian Opera company at St. Petersburgh, for the season 1851 and 1852, which begins next month, will include Mdme. Grisi and Mdme. Persiani, Mario and Tamberlik, Tamburini, and Tagliafico: Herr Formes has also been engaged.

The Sacred Harmonic Society gave a very fine performance of Haydn's "Creation," on the 19th inst. at Exeter Hall, conducted by Costa. Miss Dolby and Reeves was encored rapturously in the air "In native worth;"

COUNTRY NEWS.

THE ROYAL VISIT TO MANCHESTER.—In answer to the application of the Mayor of Salford, for permission to call out the enrolled pensioners to assist the authorities in preserving order within the borough on the occasion of her Majesty's visit, the following notification was received on Friday:—"Whereas, by an act passed in the 10th and 11th year of her present Majesty's reign, intituled 'an act to amend the acts for rendering effective the service of the Chelsea and Greenwich out-pensioners,' it is, amongst other things, enacted 'That it shall be lawful for one of her Majesty's principal Secretaries of State for the time his warrant to the Lord-Lieutenant of any county, or the Mayor or other chief magistrate of any town or district, wherein such pensioners and persons having claims to pensions or superannuations are embodied, authorising him in case of emergency, or anticipated emergency, whereby the public peace may be endangered, or on the requisition of any officer commanding her Majesty's forces within such county or district, to call out the whole or such part of the persons so enrolled, as he may consider necessary, for any term not exceeding twelve days.' Now, know ye, that I, Henry John Viscount Palmerston, one of her Majesty's principal Secretaries of State, in pursuance of the power vested in me by the said recited act, hereby authorise you, in case of emergency, or anticipated emergency, within the borough of Salford, or its immediate vicinity, whereby the public peace may be endangered, or in case of any representation being made to you by any officer commanding her Majesty's forces within such borough or district, that the force under his orders is insufficient for the performance of the duties which may be required of it, to call out the whole or such part of the persons so enrolled, within such borough or district, as you may consider necessary, for any term not exceeding twelve days. Given under my hand and seal, at Whitehall this 10th day of September, 1851.—PALMERSTON." To the Mayor or other chief Magistrate of the borough of Salford."

REPRESENTATION OF BRADFORD.—A general meeting of the Liberal electors was held on Friday evening week.—Mr. Samuel Lister in the chair.—It was resolved to take up the vacancy caused by the death of Mr. Busfeild in the West Riding.—The names of Mr. Robert Milligan, Mr. Thomas Greenwood Clayton, and Mr. Joseph Sturge were submitted to the meeting, and after a lengthened discussion a show of hands was taken, when the great majority appeared to be in favour of Mr. Milligan, not more than a dozen being exhibited for each of the other candidates. Mr. J. V. Godwin then proposed that a requisition to Mr. Milligan be prepared. The motion was seconded by Mr. W. E. Forster, and carried unanimously.

REPRESENTATION OF EAST RETFORD.—Captain Duncombe having announced his resignation of the representation of East Retford, in order to stand for the borough of Yorkshire, his nephew, Mr. W. E. Duncombe, a son of Lord Feversham, has issued an address to the electors. He is, he states, a Conservative in the true sense of the term, and, therefore, of course, a Protectionist. No opposition is expected.

GRAND MASONIC MEETING.—The masonic lodges of Portsmouth having determined to invite Lieutenant General Sir Charles Napier, G.C.B., the hero of Scinde, to a grand banquet, a deputation from them waited upon him on Saturday last, in reference thereto, at his seat, near Fareham, when Sir Charles accepted the invitation. The dinner will take place on the 21st of October, and it is expected to be a very brilliant affair, Lord George Paulet, most probably taking the chair on the occasion. Sir Charles Napier has attained to such eminence in the order of Masons.

THE NEW SURREY COUNTY GAOL AT WANDSWORTH.—This edifice, situated as a substitute for the old one at Guildford, Kingston, &c., is at length completed, and is now ready for the reception of prisoners. It is built upon an elevated and salubrious site, Wandsworth-common, and, from its extensive outline, has a most commanding aspect. The external walls enclose an area of 13 acres, a large portion of which is appropriated as airing grounds, &c.; the building itself, which is of an irregular pentagonal form, occupying the remainder, about 1000 feet in length, and 660 feet in depth. The design is by D. Hill, Esq., architect, of Birmingham. The style is plain, consisting of massive brickwork, with stone quoins and dressings, the interior having all the modern improvements and arrangements, as at Pentonville and similar prisons: it is, moreover, entirely fireproof; and the whole details of the plan have been ably carried out by Messrs. Locke and Nesham, of Theobald's-road, the builders. This gaol is calculated for 700 prisoners—335 males, and 165 females; a separate cell for each, measuring 13 feet by 7 feet, and 7 feet in height; and there are also 47 receipt on and punishment cells, the whole of the floorings of which, as well as effectually to exclude damp, are laid with Orsi and Armani's patent metallic lava. The chapel has 394 separate sittings, and, from the floors being laid in chequered blue and white Staffordshire tiles, has a very neat appearance. Throughout the whole building, since separate to Pentonville is applied for warming, ventilating, cooking, drying clothes, &c.; while the kitchen, cooking apparatus, bakery, &c., are located from the main building. The magistrates' room and the apartments for the respective officers are neatly, but not expensively, fitted.

SAILORS' HOME AT BRISTOL.—On Tuesday afternoon an influential meeting of the merchants, shipowners, &c., of Bristol, was held at the office of the British Local Marine Board, Prince-street, for the purpose of adopting measures for the establishment of a sailors' home. Philip W. S. Miles, Esq., M.P., was called to the chair, and the meeting was addressed by Captain Hall, R.N., who most graphically detailed the hardships which sailors suffered while conveying the necessaries and luxuries used by the community, after quitting the harbor of their country, and who upon their return home were immediately seized upon by crimps, and conveyed to low and degraded lodging-houses, where they were plundered in every possible way, and initiated into every description of vice and debauchery. He also pointed out the success which had attended his efforts in establishing sailors' homes in other parts, and the benefits arising from those established in London and Liverpool. The meeting was also addressed by various gentlemen, and resolutions adopted unanimously, the purport of them being to carry out the establishment of a sailors' home in Bristol. A committee having been appointed, J. W. S. Miles, Esq., M.P., and Robert Bright, Esq., of the firm of Gibbs, Bright, and Co., of London, Liverpool, and Bristol, were appointed president and vice-president. A subscription was then entered into, and about £300 in donations, and annual subscriptions to about forty guineas, were collected in the room. A vote of thanks was given to the chairman, and the meeting separated.

MR. R. A. Stephens, chief superintendent of police, was on Wednesday elected governor of the Birmingham borough gaol, in the room of Captain Harrison, who is well known in connexion with the system of convict discipline formerly pursued in Norfolk Island.

ROBBERY ON BOARD THE EARL OF CARDIGAN'S YACHT AT SOUTHAMPTON.—An extensive robbery was on Wednesday discovered to have been committed on board the Earl of Cardigan's yacht, now lying in those waters. The property stolen consists principally of plate and jewellery. A telegraphic message having been transmitted to the metropolitan police-office, one of their most active detective officers went down by express train to inquire into the circumstances.

HOPS.—Picking has now progressed throughout Kent sufficiently to enable some slight estimate to be formed of the crop. In almost every instance the hops come down short of expectation in quantity, and superior to anticipation in quality. The weather is fine, and highly favourable for making condition in those which can be left out. The old hop-growers' prescription—

Cut early, but *last*
Well round, and cultivate—

will tell this year wherever it can be followed. Great caution is required in picking, for many hops are blighted, and the appearance of good ones will this year probably fetch a good price, we advise our readers not to spare pains on this point. Nothing can yet be said about the duty, for, although we hear of many of high quality, the quantity will not be remembered beyond that the worst pieces are generally picked first, and that every day will improve the best.

DUKE OF ATHOL.—It is proper that the public should know that his Grace of Athol exacts is. per head upon every person entering his grounds at Dunkeld. Visitors on entering are desired to put their names down in a book, and on quitting the grounds a demand is made of 1s. from each. Thus a gentleman with a family of six or seven children, or it might be ten children, would have to pay a pretty heavy toll for liberty to walk through the grounds at Dunkeld.—*North British Daily Mail.*

TURNING ROYALTY TO ACCOUNT.—An official notification, in the form of an advertisement, appears in the Manchester papers, commencing, "I, John Potter, Mayor of Manchester," and goes on to announce that "all persons who may be desirous of seeing present in the Exchange, on the occasion of her most gracious Majesty's visit to Manchester, will forthwith make application to me for admission. Every application must be for two places, specifying the names and addresses of both parties; as no such card can otherwise be allotted. Admission for each person, one pound. Should the applications exceed the number that can be accommodated, a ballot for admission will take place." Our Manchester correspondent has determined to make money by the Royal visit.

THE SARDINIAN WORKMEN.—A number of the Piedmontese workmen, who have been sent by their countrymen to visit the World's Fair, have visited Manchester, where they arrived on Sunday evening, furnished with letters of introduction to the Mayor, who had indeed prepared for their reception last week. They were hospitably received, and were shown many of the most interesting manufactures and workshops in the town. They left on Tuesday morning, having acknowledged the kindness they received by presenting the Mayor with two addresses, one in English, the other in Sardinian.

RAILWAY EXCURSION TRAIN FRAUDS.—At the Fareham bench of magistrates, on Monday last, Sir H. Seale in the chair, John Hendy, a boiler-maker, belonging to Portsmouth Dockyard, was charged with taking his seat in a South-Western Railway train without having provided himself with a ticket. It appeared that on the evening on the previous train returning to London was on the point of leaving Portsmouth terminus, the defendant was seen in taking a pass in it; but having been observed on the platform in the room by a policeman, who took charge of him, it was obvious that he could not be the owner of an excursion ticket. Accordingly, Mr. H. G. Sutton, the superintendent of the Portsmouth terminus, got into the same carriage, and went as far as Fareham, when he asked the defendant to produce his railway ticket. The defendant did produce an excursion ticket from London to Portsmouth and back, on which Mr. Sutton charged him with having purchased it at the terminus on the arrival of the train from London. This the defendant admitted, on which Mr. Sutton gave him into custody. The bench convicted him, and sentenced him to pay a fine of 40s. with costs, and in default of payment he was committed to the house of correction for two months' imprisonment. The defendant had no money at all about him when given into custody.

NATIONAL SPORTS.

To make up for the numerical inferiority of the Doncaster week, the calendar for the ensuing one comprises no less than nine race meetings, of which Eglinton Park and Manchester are decidedly the most important. The fixtures stand thus:—Monday: Cheadle (Cheshire). Tuesday: Cheam, Barnet, Leamington (pony), and Upton-on-Severn. Wednesday: Bedford, Eglinton Park, and Wakefield. Thursday, Manchester.

The only regatta to come off is the St. Mary's, Rotherhithe, on Monday; and the cricketing fixtures are confined to a match at Birmingham on Monday, and one at Hertford on Thursday.

DONCASTER RACES.—TUESDAY.

The Subscription Betting Room on Monday was crowded for some hours, but the business transacted was not by any means extensive. The racing commenced with

THE FITZWILLIAM HANDICAP STAKES of 5 sovs each.—Lord Zetland's Radulphus (J. Marson), 1. Mr. Scholefield's Post Tempore (Charlton), 2.

MATCH: 200 h. ft.—Mr. Fayne's Wingemund (Flatman), 1. Mr. H. Hill's Canica (A. Day), 2.

THE CHAMPAGNE STAKES of 50 sovs each.—Lord Zetland's Augur (J. Marson), 1. Mr. Bowes's Daniel O'Rourke (F. Butler), 2.

MATCH: £50. h. ft.—Mr. Hesseltine's Flash (Owner), 1. Lord Cadrosa's Scarborough (Owner), 2.

THE CLEVELAND YORKSHIRE HANDICAP of 25 sovs each.—Sir J. Hawley's The Confessor (Charlton), 1. Duke of Richmond's Antigone (Garvey), 2.

THE STAND PLATE of £50. Mr. J. Morris's Hungerkind, 1. Mr. J. Fowler's The Lasher, 2.

THE SELLING STAKES of 5 sovs each.—Mr. Pedley's Sweetheart, 1. Mr. Hirt's Timothy, 2.

WEDNESDAY.

THE MUNICIPAL STAKES of 200 sovs each. Lord Eglinton's Claverhouse (Marlow), 1. Mr. Winch's Herschel (Rogers), 2.

THE DONCASTER PLATE of 70 sovs. Lord Derby's Croupier (Flatman), 1. Mr. HARRISON'S Prince Caradoc colt (Charlton), 2.

THE ST. LEGER STAKES of 25 sovs each.—Mr. A. Nichol's Newminster (Templeman), 1. Sir J. Hawley's Aphrodite (J. Marson), 2.

THE PRODUCE STAKES of 100 sovs each.—Lord Eglinton's Claverhouse walked over

Her MAJESTY'S PLATE of 100 guineas.—Mr. Wrather's Maid of Masham (G. Abdale), 1. Mr. Pedley's Cossack (A. Day), 2.

SWEEPSTAKES of 100 sovs each. Mr. Pedley's Trousseau (Charlton), 1. Lord Derby's Iris (F. Butler), 2.

THURSDAY.

THE TWO-YEAR-OLD STAKES.—Alfred the Great, 1. Cestus filly, 2.

THE CLEVELAND HANDICAP.—Le Juif, 1. Worcester, 2.

THE FOAL STAKES.—Iris walked over.

SCAMBLETON STAKES.—Jack Leeming walked over.

DOVER REGATTA.

On Monday this regatta took place, in presence of some 10,000 spectators. Among the company were the Earl of Guildford, E. H. Rice, Esq., the patrons, and a host of resident gentry and visitors. The day was uncommonly fine, with a good south breze from the south-east. The first race was for boats not between oar to exceeding 20 tons, for a cup of £20. This match did not fill, and the first race was a sailing match between luggers belonging to the Cinque Ports: the first boat £10, second boat £3, third boat £1 10s. For the race five boats started at half-past twelve, viz.:—

Name.	Port.	Owner.	Colour.
Lucy	Kingsdown	L. Jarvis	Red, white, and blue horizontal.
Dixon	Dover	R. Atherden	Red burgee, white ball.
Ann	Dover	T. Davison	Red burgee.
Queen Victoria ..	Dover	E. Hogg	Blue burgee, white ball.
Ann	Dover	F. Atherden	Blue burgee.

This was the great sailing match of the day. The course lay from the committee vessel, moored in the centre of the Bay, round a buoy off the Admiralty Pier, to the South Sand light vessel, and back to the committee boat. In rounding the buoy the *Stag* took the lead. Here the *Lucy*, of Kingsdown, carried away her mainyard, and became disabled. The *Stag* still kept her advantage, closely followed by the *Ann*, of Dover. The distance sailed was about 14 miles. The boats came in as follows:—

Stag	1
Ann	2
Queen Victoria	3
Dixon	4

Second race, by scratchers belonging to the Cinque Ports, in second-class four-oared galleys, for a purse of £7, to be divided as follows:—First boat, £4; second ditto, £2; third ditto, 1. The following started, and came in as under:—

Union	Red, white chequered	(Gunner Dowling) 1
Pink	Red and white perpendicular ..	(J. Terry) 2
Witch	Red, white cross	(Corpen. Ramsey) 3

The third race was between first-class four-oared regatta-built cutters, not exceeding 26 feet in length, open to the Cinque Ports: first boat, £12; second ditto, £3; third ditto, £2.

For this race the following five boats started:—

Mosquito—Dover ..	Red	T. Culmer.
Midge—Dover	Pink	J. Edmuder.
Fire-fly—Dover ..	Red, with white centre ..	G. Hutchins.
Metra—Folkestone ..	Dark blue	H. Jeffreys.
Lelia—Hastings	White and blue horizontal ..	C. Hildred.

This was the most exciting race of the day. At starting the Folkestone boat took the lead and kept it for three parts of the course, hardly pressed by the *Mosquito*, of Dover. Here the *Mosquito* drew upon the Folkestone boat, and at the winning-post came in about two lengths ahead. The other competitors were nowhere. Punt and other matches followed, and an excellent day's sport was achieved.

TRADESMEN'S OARS' WAGER.—A number of respectable tradesmen contended on Monday evening, at Lambeth, for a pair of Albert watch chains, value £5, and a pair of silver oars, and other prizes, presented by Mr. Coster, the proprietor of the Red Lion, Fore-street, Lambeth. The race was in three heats. Final heat: Hinkin and Larkins, 1, Sanderson and Constable, 2.

The Bishop of Oxford is said to be engaged on a tour of observation in Switzerland, visiting alternately the Protestant and Roman Catholic cantons, and taking personal notes of their relative social condition, with the intention of using his information during the next session of Parliament. His Lordship also intends to carry his researches through the Papal States.

On Saturday morning a shocking occurrence took place on the Leicester and Swannington railway, at the point where the line passes the Rosslane, a short distance from the Leicester station. A coal train passed over the body of a gentleman named Mallin, formerly a resident of Hinckley, and completely severed his head from his body. It is supposed that it was a deliberate act of suicide, the deceased having thrown himself on the line so that the engine-wheels might pass over his head.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

The Quarterly Court of Bank Proprietors, for the declaration of a dividend was held on Thursday. The chairman announced the dividend for the past profits of the half-year ending the 30th of August last were £584,188, being £13,394 less than those of the preceding half-year. The "rest," out of which the dividend is to be made, amounts to £6,956,964, which enables the Directors to declare a dividend of 3½ per cent., leaving the "rest" at the amount of £3,057,613. The directors, therefore, proposed that a dividend of £3 10s. per cent. be made out of the interest and profits for the half-year ending the 31st of August last, without any deduction on account of income-tax." After some discussion the proposition was agreed to. The present dividend is 1 per cent. less than the last.

The Turkish news has been the principal means of influencing Consols during the past week, the speculators acting for the fall upon the news of the extension of the state of siege to the department of the Ardeche. On Monday, a decline of 9/8 ( ) took place in Consols, Reduced, and Bank Stock, on the Foreign Stock, on Tuesday, advanced prices to 99⅝ 96. At the opening of the Market on Wednesday, ¼ per cent. advance was marked, but not maintained, prices quoting at the close the same as on the previous day. Heaviness prevailed again on Thursday, a limited business acting on prices, and Consols receded to 99⅜. The unfunded debt is rather lower this week, having been reduced by a sharp Bank Stock is closed for the dividend, which will be payable on and after this day. At the close of business the market was heavy at the following quotations: Three per Cent. Consols, 99⅜; India Stock, 264; India Bonds, under £1000, 30 p; Consols for Account, 99⅜; Exchequer Bills, £1000, 44 p; Do., £500, 44 p; small, 44 p.

A decline in Mexican, Spanish, and Sardinian scrip forms the principal feature of the last week in the Foreign Market. Mexican declined on Monday from 26⅜ to 26⅛ on Wednesday, and now quotes only 25¾. Sardinian Scrip has receded to 4 discount, but at present quotes a shade higher. Spanish Five per Cents have touched 20, but have since improved 1 per cent. A proposition by the Government of Guatemala to make a composition for the debt owing here has been discussed, but not agreed to. a modification having been proposed, which, when sanctioned, it will be time enough to quote, as the documents on both sides are very voluminous, and, in all probability, will neither of them be accepted. The general tone of the market at the close of the week was dull, prices quoting—Mexican, Five per Cent., 25⅝ Jan. Consols, 99⅜; ditto, Account, 99⅜; Portuguese, Four per Cent., 32; Russian Bonds, 111; ditto, Four-and-a-half per Cent., 101½; Sardinian Bonds, Five per Cent., 89⅛; ditto, Scrip, 3⅞ dis.; Spanish, Passive, 4¾; Ditto, Three per Cent., 37; Dutch, Two-and-a-Half per Cent., 62 Guild., 58⅞.

The share settling passed off with tolerable ease, and prices for a short time improved, but at present the tendency is to flatness, as the following list will show:—

ORDINARY SHARES AND STOCKS.—Caledonian, 10; Chester and Holyhead, 14⅞; East Anglian (£25 paid), 2¾; East Lincashire, ; Great Northern, 1; New; Ditto, Halves A, 4¾ new; Ditto, Halves B, 12 new; Great Western, 76½; Lancashire and Yorkshire, 81½ x d; London and Blackwall, 6¼ x d; London and North-Western, 113; Ditto, Fifths, 19¼; Ditto, 4/10 Shares, 15¾; London and South-Western, 79¼; Manchester, Sheffield, and Lincolnshire, 25¾; Midland, 44; Newry and Enniskillen, 18; Shropshire Union, 4; South-Eastern 18; South Wales, 37; York and North Midland, 17.

LINE LEASED AT FIXED RENTAL.—Wilts and Somerset, 30.

PREFERENCE SHARES.—Caledonian, 7; Chester and Holyhead, 14 x d.; Lancashire, Preferential, and South Coast, New Guaranteed, 140; Manchester, Sheffield, and Lincolnshire, new £10, 11 x d.

FOREIGN. Boulogne and Amiens, 10½; Namur and Liege, 6; Rouen and Havre, 9.

THE MARKETS.

CORN EXCHANGE.—Rather a large supply of new English wheat having appeared on sale this week, in excellent condition and numerous offers having come to hand from Cambridge-shire and Lincolnshire, to deliver samples of free, 52 to 54 lbs. per bushel, at 38s per quarter the demand for all descriptions notwithstanding the numerous unfavourable reports as to prices, was by no means active, and ruled heavy, at a decline in the quotations of from 1s to 2s, in some instances, 3s per quarter, at which amount of depression clearances have not been effected. In foreign wheats, the import of which has been of a exceedingly limited extent transacted, at is per quarter less money. We have had a steady, though by no means brisk, inquiry for barley and malt, at full previous currencies. Most of the oats set by arrived have changed hands, at very full prices. Beans and peas have been neglected, but a full average sales have been doing in Indian corn and flour.

English.—Wheat, Essex and Kent, red, 40s to 40s; ditto, white, 37s to 46s; Norfolk and Suffolk red, 34s to 40s; ditto, white, 36s to 42s; rye, 28s to 30s; grinding barley, 24s to 26s; malting ditto, 28s to 30s; malting ditto, 30s to 36s; Kent and Essex malt, 47s to 54s; brown ditto, 44s to 46s; Kingston and Ware, 50s to 54s; Chevalier, 52s to 55s; Yorkshire and Lincolnshire, 46s to 48s; ditto, 50s to 52s; pigeon beans, 30s to 32s; tick beans, 32s to 36s; ditto, old, 28s to 30s; grey peas, 32s to 37s; maple, 34s to 37s; white, 32s to 35s; boilers, 34s to 36s per quarter. Oats, Essex and Suffolk, 23s to 25s; Scotch and Yorkshire, 23s to 25s; Stockton and Yorkshire, 23s to 25s per 304 lbs. Flour, Suffolk, per sack, 40s to 45s; Norfolk, 36s to 40s per sack.

Foreign.—Wheat, Dantzic, 44s to 46s; Konigsberg, 42s to 44s; Pomeranian, 42s to 44s; Rostock, 42s to 44s; Marianopoli, 42s to 44s; Taganrog, 40s to 42s; Egyptian, 36s to 38s per quarter. Barley, Pomeranian, 24s to 26s; Danish, 24s to 26s per quarter. Oats, Dutch, 20s to 22s per 304 lbs. Beans, 34s to 36s per quarter. Peas, 32s to 34s per quarter.

The Seed Market.—The demand for rapeseed is steady, at full prices. In other seeds, next to nothing is doing.

Linseed.—Hull, white sowing, 60s to 65s; Baltic, crushing, 48s to 52s; Mediterranean and Odessa, 48s to 50s, compared, 52s to 56s per quarter. Coriander, 16s to 18s per cwt. Brown mustard seed, 8s to 10s; white ditto, 7s to 9s per bushel. Tares, 40s to 44s per quarter. English rape-seed, new, £5, to £5 per last of ten quarters. Linseed cakes, English, £8 10s to £10 0s, foreign, £7 10s to £8 5s per ton. Rape cakes, £5 5s to £5 10s per ton. Coriander, 12s to 14s per cwt. Canary, 38s to 40s per quarter. English clover-seed, red, —s to —s; extra, —s to —s; white, —s to —s; extra, —s to —s per cwt.

Bread.—The prices of wheaten bread in the metropolis are from 6d to 6½d; of household ditto, 4½d to 5½d per 4 lb loaf

Imperial Gazette Average.—Wheat, 38s 5d; barley, 26s 1d; oats, 19s 5d; rye, 35 0d; beans, 28s 8d; peas, 27s 8d.

The last Weeks Average.—Wheat, 39s 11d; barley, 26s 2d; oats, 20s 2d; rye, 0s 0d; beans, 30s 0d; peas, 29s 0d.

Oats.—Wheat, 1s; barley, 1s; oats, 1s; rye, 1s; beans, 1s; peas, 1s

Tea.—The supply of teas kinds of tea on offer in the public sales this week is somewhat excessive, whilst the general demand is heavy, at barely stationary prices. Common sound congou, 9½d to 10½d per lb.

Sugar.—West India qualities have met a very dull market, at barely last week's currency. In other kinds have given way 6d per cwt. Refined goods dull, at 44s 6d to 45s per cwt. Grocers' lumps, 47s to 48s. We have very few transactions to notice

Coffee.—Plantation Ceylon has moved off slowly, at 1s per cwt less money. Good ordinary and fine native Ceylon, 44s to 46s per cwt. Mocha, 60s per cwt.

Rice.—Bengal is rather easier to purchase. Good white is quoted at 9s 6d to 10s per cwt.

Provisions.—The best Irish butter is in moderate request, at is per cwt more money. Carlow, 76s to 78s; Limerick, 76s to 78s; Cork, 78s to 82s; Limerick, 72s to 74s; Waterford, 68s; Sligo, 70s to 72s per cwt. Foreign has given way 2s per cwt. English steady, at 84s to 90s per cwt. For Dutch and Belgian 10s to 15s per cwt. more is the asking rate for fresh. In bacon very little is doing, and the quotations have given way 1s per cwt. Waterford singles, 58s to 60s; heavy, 56s. Lard is the turn higher. Irish singles, 54s to 56s; Limerick ditto, 50s to 52s; heavy, 48s per cwt.

Tallow.—Owing to the limited shipments from St Petersburgh, the demand is active, at a premium. Now C's, on the spot, are sold at 50s 6d to 50s; and old, 50s 3d to 50s per cwt; St Petersburgh tallow, 47s 6d per cwt; not cash.

Oils.—Only a limited business is doing in our market, and the rates are with difficulty supported. Linseed, £1 11s 6d to £1 12s per cwt.

Spirits.—The demand is moderate, and drooping prices. Proof Leewards, is 6d to is 6½; and proof East India, is 3d to is 4d per gallon. Brandy steady, and quite as dear. Geneva steady, at is 7d to is; and British made spirit, 2s 6d to 2s 8d per gallon, not cash.

Coals.—Lady Wood, West Hartley, 13s. Carr's Hartley, 15s. East Hetton, 18s; Wylam, 14s 6d; Hetton, 14s 6d; Eden Main, 14s 6d; Seaham, 15s 6d; Melsom, 15s 6d; Stewart's, 15s 6d per ton.

Hay and Straw.—Meadow hay, £2 15s to £4, clover ditto, £3 5s to £4 10; and straw, £1 15s to £2 2s per load.

Hops.—Large supplies of new hops have arrived this week, in good condition. Weald's have sold at from £3 10s to £7 7s; and Sussex, £3 to £5 5s per cwt. Duty, £1,000 to £11 000

Wool.—No change has taken place in our market, in which only a limited business is doing, at about sanitionary prices

Potatoes.—The various markets are still heavily supplied, but the trade is heavy, at from £1 10s to £2 5s per ton.

Smithfield.—In beef trade has ruled very dull, at barely last week's currency. In other meat a good demand has been transacted

Beef, from 3s 6d to 4s 4d; mutton, 3s 6d to 4s 8d; veal, 3s 8d to 4s 8d; pork, 3s 4d to 4s 8d per 8 lb to sink the offals.

Newgate and Leadenhall.—These markets have been well supplied during the whole o the week, and the demand has been steady:—

Beef, from 3s 0d to 3s 8d; mutton, 2s 6d to 3s 10d; veal, 2s 8d to 3s 6d; pork, 2s 6d to 3s 8d per 8 lb, by the carcase.

On the 18th inst, at Sedal by the Rev Thomas Everett, the Rev Edward Everett, son of Jos. de Hagen Everett, Esq. of Biddenden, Wilts, to Ellen Anne, only surviving daughter of the late Capt. Averley, Esq., of Sedal in the county of Somerset.—On the 8th inst. Thomas Fox, of Pentaloe, to Sarah, second daughter of the late Rev George Moor, prebendary of Lisco n, and rector of Landoe, Cornwall.—On the 11th inst, Edmond Wilson Oldham, Esq, barrister-at-law, to Frances Margaret, eldest daughter of the late Colonel C Rawlinson of Bombay, and niece to the late General Rawlinson.—On the 9th inst. the Rev Arthur J B Gould of Hemsted Park, Kent, to Lucy Mary Elizabeth, daughter of the Rev Edward Hall, Vicar of Hurst.—On the 9th inst. the Rev Stephen Ralph Spicer M.A., Sheffield, to Ruth, third daughter of the late Rev Thomas Parkinson, D.D., vicar of Sheffield.—On the 9th inst. the Rev Thomas Cave Childs Jenkinson of St Mary's, Devonport to Clara the Chevalier Count Bunsen, Prussian Minister Resident at the Court of St James's.—On the 9th inst. at Penzance, Cornwall.—On the 11th at the Viscount Van Leempoel the Belgian minister resident of the Belgian court, to Arabella, third daughter of the late Rev John Rice.—On the 11th, at St Leonard's Shoreditch, Mr Thomas Fearon, late Hetton, Lincolnshire, to Sarah, only daughter of Mr Mill and, of Cumberland-street, Shoreditch.—On Saturday the 13th inst, at all Saints Church, Notting Hill, Middlesex, by the Rev John Jaudon, assisted by the Rev Thomas Jones, Mr Thomas Hall, of Bayswater, to Miss Ann Jones, of Notting Hill.—On the 11th inst. at Bedford, by the Rev Joseph Jones, Mr Thomas Jones of the Secretary of the London Missionary Society, aged 57.—On the 13 h inst. Rachaels Delacour, the beloved wife of the Rev E J Bishop, of Buckhurst.—On the 11th inst. the Rev Christopher Ridley Ayles, Incumbent of Bramley, Yorkshire, aged 72.—On the 18 h inst. at Bacton, Lady Smythe, wife of the Rev George Harry Smyth, Bart, aged 72

DEATHS

On the 5th inst. Colonel David Herriard, C.B. of the Bengal Light Cavalry, aged 61.—On the 8th inst. the Rev Joseph John Freeman, one of the secretaries of the London Missionary Society, aged 57.—On the 13 h inst. Rachaels Delacour, the beloved wife of the Rev E J Bishop, of Buckhurst.—On the 11th inst. the Rev Christopher Ridley Ayles, Incumbent of Bramley, Yorkshire, aged 72.—On the 18 h inst. at Bacton, Lady Smythe, wife of the Rev George Harry Smyth, Bart, aged 72

NEW BOOKS &c.

NATIONAL ILLUSTRATED LIBRARY.
BOSWELL'S LIFE of JOHNSON. Vol. III. Now ready, Vol. III. of this popular Series, illustrated with Portraits of Johnson's most celebrated contemporaries, and with topographical and other sketches of the principal scenes.
Vol. IV will be ready with the Magazines, on the 30th instant
The following Volumes of the series have already been published, price 2s 6d each, handsomely bound, and copiously illustrated with Wood Engravings, by the most eminent artists:—
The MORMONS: a Contemporary History.
The BOOK of ENGLISH SONGS
The ORBS of HEAVEN; or, The Planetary and Stellar Worlds. By D. O MITCHELL, M.A.
Several other Volumes, original and selected, are in preparation, including "Jack Ashore," vols. in Chess, "Jack Ashore," vols. in Chess, "Jack Ashore," vols. in Chess,

EXHIBITION SUPPLEMENT TO THE ILLUSTRATED LONDON NEWS.

No. 518.—VOL. XIX.] SATURDAY, SEPTEMBER 20, 1851. [TWO NUMBERS, 1S WITH WHOLE-SHEET SUPPLEMENT, GRATIS.

THE GREAT EXHIBITION.

THE HIGHLANDS IN THE EXHIBITION.

It was hardly, perhaps, to be expected that the rude and scattered population, sprinkled over the wild hills and pathless moors, by the rocky shores and desolate lochs of the north, would have done much to help in furnishing forth of the Crystal Palace. With the exception of the home manufacture of a few coarse articles of attire, the industry of the Celt unconfined to the rude and insufficient tillage bestowed upon his "croft" stunted oats or barley; or, if he be located near the sea, to a clumsy and inefficient system of fishery, carried on without proper boats or tackle, and seldom or ever succeeding in rearing really bold or skilful mariners. The Celt, indeed, seldom makes anything but at most a freshwater sailor. He will brave the wildest wintry storms on the high hillside, searching with his faithful "colleys" for the sheep smothering in the snow-drift; but the sea always daunts him. If anything can induce him to change his landward habits for a time, and fairly to take to the brine, it is the herring; and those wondrous shoals of dainty fishes quickly come upon the coast during the summer and early autumnal season, when the weather is settled and the harvest moon round and bright. Destitute, then, in a great measure, of that pushing energy and hard and keen spirit of industry and enterprise which have made England and the south of Scotland what they are, the poor Highlanders of the north and west have very seldom any leaders or teachers who might pioneer the way to a better and busier state of things. Capitalists pass them over; and their own lairds and native dignitaries are made of very much the same stuff as themselves. Good, hospitable, easy-going gentlemen, tolerably well skilled in black cattle and Cheviot wedders; hunters and fishers, to a man; great upholders of the bag-pipe, and great connoisseurs of whiskey—they are still not the race of magnates who are the best suited to promote the true interests of the poor people among whom they dwell. They have been accustomed for ages to think of the poverty and idleness about them as the normal and natural state of things; and the poor cottar entertains precisely the same views. He has had nobody to put other ideas into his head. A little oatmeal, a herring in the season, a few potatoes, perhaps a little dairy produce, particularly goat's or ewe milk, and he is abundantly satisfied. His hut is chimneyless, sometimes windowless—a mere hovel of piled up turf, with a smouldering peat fire in the centre, over which hangs the one pot which performs all culinary operations, and round which are tolerably sure to be stretched a ring of shaggy colleys; but leave him this leave him his native atmosphere of peat smoke, and he is ready cheerfully to rough out any of its incidental hardships as the merest matter of course. In these respects the Scotch Celt is very much akin to his Irish brother. Both of them appear lazy; rather, however, because they have been brought up in idleness, than because they have any natural horror of work. Connemara and the Isle of Mull both get capitally ahead when the muscles and sinews they send forth are used in conjunction with those of England and Lowland Scotland. Donald and Pat trot cheerfully in the team, and pull with the rest of their compeers; but leave them together with a couple of spades and a couple of wheelbarrows, and short and scanty will be the day's work achieved. A main point of difference between the two races, or rather the two branches of the same race, is the sober and serious-mindedness of the Scot, and his invincible respect for the sacredness of human life. No one ever heard of a Highland evicting landlord or his agent being shot from behind a hedge. The Irishman always cries out when he is hurt, and in a score of ways lets the world know his grievances; sometimes, indeed, he proclaims them through musket-barrels. Not so the Scotch Highlander. In no part of the West of Scotland have the people suffered more than in some of the poorer islands of the Hebrides. There have been comparatively as many evictions as many "fires quenched upon the hearth"—in the wild islands and portions of the mainland of the west, as in Cork, or Roscommon, or Tipperary; but not one-tenth so much noise has been made about them. There has been no tumult, no indication of popular rising, no agrarian outrages, no private and cowardly assassinations. The people have died or gone away to America, and made no sign. Highland grievances are scarcely ever heard of, but they are not one whit behind the woes and the wrongs of Ireland in number or intensity.

Life in the Highlands, then, so far as national industry is concerned, is little better than passive vegetation. The yearly irruption of English tourists and sportsmen into the country furnishes, no doubt, a certain amount of employment, and distributes an important sum of money. The energies of no inconsiderable portion of the population are called into action as guides, boatmen, game-keepers, and the whole tribe of rural supernumeraries, who hang on the skirts of a pleasure and sporting-seeking community who come abroad to spend money and amuse themselves. But the facilities thus afforded for labour can hardly be said to amount to a national industry. The working season extends over only three or four months, with, generally speaking, an naturally exaggerated prices paid for the services performed. Hellda; work, indeed, as it is rare and uncertain, ordinarily realises exceptional prices—a fact of which the population of watering-places and bathing-places, for example, are amply aware. In the Highlands, then, the people are destitute of the faculty which carves out profitable employment for itself. They are energetic to the utmost as sportsmen, lazy to a degree as labourers; just, in fact, because sporting in some shape or other is the labour to which they have been taught to consider themselves devoted. Above the class of the peasantry there is as little enterprise or desire for change as lower down: the only social revolution favoured by the lairds being the removal, either to the south or across the Atlantic, of as many poor and half-starved "crofters" as possible, in order that their vacant patches of land may be flung together into huge expanses of grazing-ground for Lowland sheep farmers. Under these circumstances, we repeat, we had hardly expected to see the Highlands represented in the Crystal Palace at all; and we probably should not have been so agreeably disappointed as we have been, were it not for the manful and single-handed exertions of one singularly enterprising, active, and indefatigable tradesman of Inverness. The name of this individual, Mr. Macdougall, has now attained something like a European reputation as a dealer in all textile and other productions manufactured in, or characteristic of, the Highlands. From Inverness, the capital of the Highlands, and the centre, judicial and commercial, of a large district of interesting country, it was to be expected that a comparatively large and characteristic collection illustrative, not, indeed, of a commercial industry, but of those domestic pursuits and household works which every people, however rude, must in some degree practise—would be sent. Nothing of the kind, however. The enlightened Invernessians declined to form any local committee, or to take the slightest trouble about the matter; and Mr. Macdougall, after in vain trying to inspire his townsmen with a spark of his own spirit and energy, was actually obliged to put himself in communication with a committee formed in the smart and rising little town of Elgin, in order to have the means of forwarding to the Crystal Palace a collection of Highland manufactured stuffs, in the original production of which he himself had no mean share. In the gallery above China there stands the stall which alone represents the industrial condition of the Scottish Highlands. We have already noticed it in a general approving paragraph, and we propose now to select a few of the objects exhibited, and to string them together by a slight thread of personal Highland reminiscences and remarks.

GROUP OF MALTESE VASES.

The Maltese stone is of a rich cream white colour, and, being soft, is easily carved. It is, however, not susceptible of polish, and would soon yield to the influence of moisture. It is, therefore, not available for external decoration; but for hall ornaments, such as vases, jugs, pedestals, &c., it is extremely well adapted. The carvers of Valetta have long been celebrated, for their works in this line, and in the present Exhibition make a very handsome show. The forms are in various styles, chiefly after the antique, and the ornaments comprise sentyrs' heads, vine leaves, flowers, &c., all admirably executed. The objects which we engrave are severally by F. Testa, S. Testa, and De Cesare, evincing elegance and variety of design, and softness and delicacy of finish.

is various tartans of the clans ally form a conspicuous object g the textile stuffs exhibited. several checks are stated to be ranged upon the very highest authority; for, be it noted by the English reader, there are formidable differences of opinion among the authorities that be relative to the exact and orthodox set or plan and colour of the checks of more than one tartan. You shall have a couple of fiery Highland antiquaries disputing the shade of a red, or the proper

breadth of a stripe of green, as if the fate of the world rested upon the issue. But if you wish to see both gentlemen roused to the pitch of the most appalling indignation, hint Dr. Johnson's theory, that the origin of tartan was rags, and that the different colours are counterfeit presentments of the variously hued shreds and patches with which the Doctor maintained that his Highland friends used to clothe themselves. Recent investigations, we believe, however, give a higher antiquity to the tartan than it is generally believed to possess. Down to the reign of the sixth James, tartan is now said to have been a common wear, both in the Lowlands and Highlands; and recent discoveries in ancient costume seem to prove that more frequented species of garment, woven of many colours, was a favourite with a large body of semi-civilised men, the ancient stuffs disappearing from the more busy and changeful parts of the world, but still lingering in such nooks and corners as the until recently almost inaccessible Highland hills. The Scottish Lowlanders never seem, however, to have worn the kilt. At one time, no doubt, the kilt and plaid were simply one piece of cloth folded at once over the shoulders and the loins. The separation of the whole into two distinct garments was a decided improvement, as the plaid for mountain counties, and for the use of a pedestrian, is one of the handiest garments which can be conceived. He can use it as a scarf, or a cloak, or a hood; rolled up and disposed round the body, it offers no impediment to walking; in wet and stormy weather the wearer can wrap at least half a dozen folds round his person from the throat to the thighs, while, however the cloth may be disposed, the effect is almost uniformly picturesque. At the present day the gorgeous clan colours formerly worn in the Highlands are very generally superseded by the dull uniform grey of the shepherd plaid, a specimen of stuff which Lord Brougham has fairly immortalised. Everybody who has seen his Lordship for the last fifteen years or so, has seen the famous black and white trowsers in which he delights. The fact as to these monotonously succeeding garments, we believe, from good authority to be this: when Lord Brougham, then holder of the Great Seal, was in Inverness, when, indeed, he made the celebrated declaration at a public meeting that he would write to the King by that night's post, he purchased from Mr. Macdougall cloth for exactly forty pairs of shepherd tartan trowsers, and in this ample supply he has been going on ever since. The tendency of greyish stuff, however, to take the place of the ancient clan colours, would not have been less marked had Lord Brougham never worn anything but broadcloth. The simple web of uniform hue is more easily produced than the kaleidoscopic count of many colours, and, in case of damage, is more easily and effectively repaired. It was, however, the mean sumptuary law, passed in 1747 by the Legislature, which gave the death-blow to the tartan, the kilt, and the plaid. Upon the people being permitted, in 1782, to return to the garb of the Gael, the general use and wont of the country was found to have worked out for itself another channel; and the philabeg is now, to all intents and purposes, a fancy costume. In Mr. Macdougall's stall all the adjuncts of this dress are shown, constructed after the most approved fashion. There are several bonnets characteristic of the Highlands, all neat, small, and fitting close to the head. The dreadful monstrosity of ostrich feathers, which four unhappy Highland regiments are obliged to wear as head-gear, and which look exactly as if the men had adorned themselves with the spoils of an undertaker's warehouse, have nothing to do with the original Highland bonnet, and we should be glad to see them scouted from the army. Slaves as we are, in some way, to the tyranny of all sorts of abominable hats, there is nothing worse in British time than the heavy cylinder of feathers worn by the Highland regiments. How much smarter the men would look each with a neat Glengarry bonnet, light and warm; jaunty and gay when worn with a cock over the front of the head, and cosy and comfortable if pulled over the ears, and made to do duty for a nightcap. The broad blue bonnet is essentially Lowland, as its common Scotch name, the "Tam O'Shanter," testifies; but the mountain head-gear is infinitely the smartest and the most picturesque.

There are a good show of hose, the knitting being worked in the great measure knitted by hand. These coverings for the feet, strong, elastic, firm of fabric, yet fleecy and warm, are capitally adapted for hard pedestrian work upon the mountain side, preventing the skin from being chafed, and absorbing and removing the perspiration from the limb. The hose, according to old use and wont, are always manufactured on a pattern larger and simpler than ordinary tartans, but, of course, harmonising with the general colour of the dress which they are intended to complete.

Some interesting specimens of the old brogue are shewn. The wondrous peculiarity to an English eye in the Highland school of shoe-making, is that the upper leathers are pierced with rows and arches of holes arranged in fanciful combinations and interspersed with little scolloped and jagged edges of leather, designed to ornament the shoe. "Well, now, if I ever saw the like of that—making holes in their shoes to let the wet come through! they must never be without colds in the head," was the purport of a not unnatural remark I heard made, in different words, more than once while Mr. Macdougall's stall was open. But the speaker was not aware that wet feet is a bugbear unknown in the Highlands. Shoes without holes may do capitally well for the *pass* or the turnpike, but transfer the scene of operations to a mossy hill-side or a wild ravine, down which scores of tiny brooks come tumbling to join the torrent at the bottom, and the wearer will shortly find that no holes are no protection against the water getting in, but a great hindrance to its getting out, and so will go bobbing along with an uncomfortable quantity of fluid splashing between his foot and the shoe. "Well, now, if I ever saw the like of that—making holes in their shoes to let the wet come through! they must never be without colds in the head," was the purport of a not unnatural remark I heard made, in different words, more than once while Mr. Macdougall's stall was open. But the speaker was not aware that wet feet is a bugbear unknown in the Highlands. Shoes without holes may do capitally well for the *pass* or the turnpike, but transfer the scene of operations to a mossy hill-side or a wild ravine, down which scores of tiny brooks come tumbling to join the torrent at the bottom, and the wearer will shortly find that no holes are no protection against the water getting in, but a great hindrance to its getting out, and so will go bobbing along with an uncomfortable quantity of fluid splashing between his foot and the shoe. The guide, on every dry bit of ground, squirts the superfluous moisture about with every step. Shoes intended for hard work among the heather are peculiarly made in being double-toed. One or two strongly and firmly made specimens are exhibited. The stem of the heather plant is very rough and nearly as hard as wire, so that the toes of the sportsman's shoes who forces his way amongst it, are speedily, unless they be thus doubly armed, reduced to a pitiful condition of thinness and whiteness. In these brogue-shoes the nails which fortify the soles are driven in diagonal lines across, the arrangement giving a surer footing to the wearer when scrambling among slippery rocks or making his way amid the green and slimy pebbles of a Highland burn, with the fierce stream shaking him on his legs. For Highland sporting, and, in especial, Highland fishing, requires that the edge shall be no more afraid of water than a kelpie or a merman. Mr. Briggs goes out a fishing in the quiet southern streams with a pair of patent waterproof india-rubber goloshes to keep his precious feet dry; but if he adventures on a foaming, rattling Highland river, and essays the noble salmon instead of the contemptible pike—he must make up his mind to many a plunge, waist deep or deeper, in the stream, if he have the luck not to flounder over the slippery stones and get carried off altogether by a current running like a mill sluice down into the next deep swirling pool.

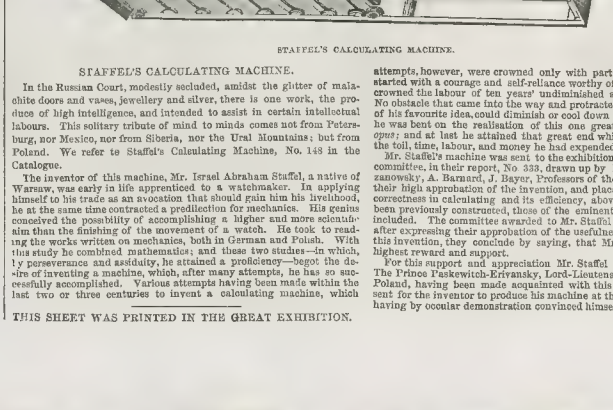
The Highland ornaments displayed are few, but in correct taste and of the orthodox old fashion. The principle of the ancient brooch, used either as an ornament or for fastening the drapery of the plaid, is a very simple one. A number of silver spokes springing more or less up from a circular rim, support a cairn gorm pebble in the centre. Sometimes a set of small pins rise from the circumference of the ornament, each topped by a small cairn gorm, arranged like moons around the centre. The cairn gorm is indeed the national precious, or, at all events, ornamental, stone of Scotland: specimens are not uncommon of as bright a sparkle and as pure a crystalline splendour as are to be found in emeralds. The search amongst the wildest Grampian hills for these beautiful rock crystals, has lately, we learn, been prosecuted with uncommon enterprise and perseverance, and a deposit of splintered and disintegrated rock has been discovered, in which abundant pebbles have been found, formed in six-sided prisms, terminated by six-sided pyramids, extending from one inch to six or eight in length. Some of these lumps have weighed as much as 10 lb., and they have been discovered of several colours. Mr. Macdougall has furnished his stall with some remarkable specimens, of a dark port-wine hue, fully six inches in length, and we should think, double as many in circumference. The six-sided tops have been wrought, and exhibit a lustrous polish. These stones, we believe, are part of the produce of the labours of a party of upwards of forty people, who last year proceeded from various parts of the Highlands in a regular caravan to the remote district in which the stones were found: they pitched their tents or erected bothies on the heath, and after a search extending over several weeks returned to their homes loaded with the rough crystals of the hills. The remaining accoutrements of the Highland dress are shewn in specimens of the dirk, to be worn by the side; the *skean dhu*, or "black knife," frequently carried in the garter; the naked blade resting against the leg, and which was used by the Highland sportsmen to cut the throat of the wounded deer, and afterwards, in all probability, to carve and help the smoking haunch; the powder-horn, generally set jauntily off with cairn gorm and silver mountings, and hung by a silver chain, although we suspect that in most of these little matters, a smirking spirit of small dandyism has encroached upon the veritable simplicity of the garb of old Gael. A whiskey flask was seldom, however, left out of the list of the mountaineer's equipments. We perceive that the present fashion of disposing of the mountain dew for a day's trudge among the hills, if to place it in a miniature barrel, very much like that carried by Continental *vivandières*, and certainly, to our minds, neither elegant nor likely to be convenient. The spirit, however, thus provided for, you imbibe it by means of the *quaigh*, or wooden drinking-cup, a handy little vessel, neatly scooped out of a block of hard wood, and sometimes carved with taste and ingenuity round the rim. The quaigh is occasionally made very ornamental, and we have seen them with very large and brilliant cairn gorms let in at the bottom. The contents of an ordinary sized quaigh must be equal to at least two wine-glasses and a half; but hardy and strong-headed Donald will fill it to the brim with whiskey, perhaps 11 over proof, and turn it coolly over without a muscle wincing or a pulse beating the faster for the exploit. In some of the more unfrequented parts of the country about the Highland line, where these wooden implements of festivity have found their way without bringing their Gaelic names along with them, we have heard a quaigh called a *bass*, the word being one of many hundreds of corrupted French expressions, which still live in old-fashioned neighbourhoods, to demonstrate the ancient social as well as political alliance of Scotland and France against our "auld enemies of England."

Above the stall, and forming a central top ornament, is a magnificent red deer's head, with no less than fourteen tynes or branches to his horns—an uncommon quantity, a "stag of ten" being generally reckoned to have a very liberal allowance of antlers. Round this is ranged a curious collection of very coarsely woven and peculiarly tinted stuffs, more or less connected in purpose with the monarch of the waste, and being, indeed, cloth expressly intended for the use of the deer-stalker, and dyed so as to resemble the most common patches of hue which prevail upon the dun mountain-side. Englishmen who form their notion of deer from the delicate little creatures, no bigger than goats, but as graceful as Italian greyhounds, which gambol upon the smooth shaven turf and the woodland vistas of our parks, have little idea of the fierce, powerful, majestic, and thoroughly savage animal known as the red deer. It is but seldom that the ordinary traveller in the Highlands gets a glimpse of him. He must be sought for in his own haunts—in the wildest, most rugged, and inaccessible recesses of the hills—and his vigilance must be evaded by the most careful and experienced manœuvering. The red deer has an eye like an eagle's, and a nose like a bloodhound's, or even more delicate still, as a human being passing him to windward a mile off, communicates a subtle taint to the keen air, which he scents and quivering nostrils—a perfect ball of acute nerves catch in a moment, and which is almost certain to produce a rapid flight, the animal running perhaps a dozen of miles ere it couches down again into the heather and fern. At some seasons, however, the red deer shows no such timidity or instinctive desire to take refuge in flight. Unwary wanderers in the hills have been suddenly startled at finding themselves confronted in a moment with a magnificent stag, who, emerging from his cover, stands, all save his gleaming eyes and dilated nostrils, as rigid as a stag of bronze, gazing in grim silence upon the profaners of his temple of the wilderness. Occasionally we have heard of large herds of deer, the hinds led by their magnificently antlered lords and masters, surrounding the astonished wayfarer, and after gazing for an uncomfortable number of very long minutes at the intruder as if giving him to understand, by the silence and solemnity of the ceremony, the dreadful sacrilege of which he had been guilty in penetrating their enchanted domains—in an instant, upon a toss of the head of the ancient leader of the herd, leaping round, and in a moment disappearing in the cover of the surrounding copse. The reader can conceive the difference between these thoroughly wild creatures of the wilderness, as perfectly savage in their nature, as when the boar and the Caledonian bull were their compeers in the waste, and the half-tamed roe, which form picturesque groups in English parks, or the carted stag—Nelson or Billy—which is turned out of a wagon and chased like a hare across stubble and clover fields. All other game may be shot, but the red deer must be stalked. You walk coolly over the stubbles or over the heath, and the luncheon be ready by one o'clock, under such a tree or at the side of such a spring, and there you empty your bag and count the partridges or grouse, as the case may be. Not so with the red deer; you start rifle in hand and telescope slung across your back, upon an interminable expedition, perhaps of days: you walk as many miles over moss and moor, up vast sloping mountain sides, or down wild and rugged mountain ravines, as would suffice for many a tolerable pedestrian in the south over a turnpike-road; you examine, perhaps for an hour, with the glass the great dun slope of the opposite side of the glen. Then, perhaps you have to make half-a-score miles circuit to "wind" the game, or to get to a ford in a deep river or a ferry over a narrow loch. Then, approaching the slumbering herd, perhaps you have to crawl a mile or so upon all fours, painfully dragging rifle and body after you, and hardly daring to breathe, far less to speak; or you have to wade, waist-deep, double the distance down some roaring stream, or up it, which is worse; and, after all, it may chance, after fifteen good hours' work of which crawling, climbing, creeping, crawling, and wading, that some unexplained alarm is taken, and that, in thorough anguish of heart, you see the coveted antlers still beyond rifle reach, moving guily off above the cover. No help for it—dash yourself down among the heather, excorate the whole race of stags, deers, roes, hinds, and does, but bid Donald prepare the "bruxy" and the kebbuck; unsling your flask or little "anker" of mountain dew; make your supper (it will be sure to be a good one); speculate with the faithful gillie about the likely whereabouts of the herd to-morrow, and then, rolling yourself from head to foot in a mackintosh of the tartan plaid as the web will admit of, fix your eyes for a space upon the dark mountain tops cutting rounded or peaked slices out of the clear blue sky, all twinkling with stars; and bidding bold defiance to a distinct chilliness in the atmosphere, nay, perchance, even to a touch of early frost, go soundly to sleep amid the deer's-foot and the bracken, to be on foot next morning before the dew-drops, lit by the sun, are gemming with diamonds the purple of the heather.

The proper style of costume for this class of sporting is peculiar. It is essential that it be very strong, very light, warm, and fleecy; not too easily soiled; and that the colour or the prevailing colour harmonise with the most frequent shades of clustered vegetation upon the mountain side. All these essentials are fulfilled by the specimens of fabrics exhibited in the Highland stall, and all these fabrics have been manufactured from the native productions of the hills—the wool, in some cases, undyed, the coat of the black-faced Highland sheep; the tinctures in other cases applied to it, extracted from Highland herbs, barks, and mosses, so as to impart to the stuff the exact hue of the original plant or lichen; the thread spun upon the distaff by old Highland crones and buxom Highland lasses, the warp and the woof crossed by means of a hand-loom of the oldest fashion; the entire work, indeed, done in the hills, from the production of the wool, and by the natives of the hills. The cloth thus produced is well worthy of attention, from its stoutness, elasticity, evenness of fabric, and honesty of manufacture. You certainly might be looked at askance were you to sport the stuff in Regent-street or the Boulevards; but for the hill, the heath, and the moor, it is the *beau idéal* of apparel. The cloth is shewn of several colours, each produced by a native dye: some of these dyes have been long known in the Highlands; others are new, particularly one from a species of moss called the "crotach," and the colour extracted from deer's-foot, one of the most beautiful herbs of the North. Clad, then, in such garments, the sportsman has the best chance of escaping the vigilant eye of the reddeer, which may range over the hill-side without being able to separate him from the heath or the lichen in which he may be lying. The cloth is, of course, excellent for sporting and country purposes in general, as well as for deer-stalking; and as such we would be glad to see its use made a fashion by English sportsmen on their annual visit to the moors. Hand-loom weaving of coarse stuff is certainly not a very exalted or economically profitable industry for a community. But, at all events, it is better than no industry at all; and it may be very well combined with the small agricultural operations to which the greater number of the weavers devote a portion of their time. We shall rejoice, then, to hear that the manufacture of home-spun knitting stuffs flourishes in the North, convinced that it will bring along with it useful habits of industry, of course accompanied by the produce of industry to many a humble Highland home. Mr. Macdougall has been attempting, not only to get up new native dyes, but new native materials for cloths. He exhibits two stuffs which are great curiosities in their way. One is a cloth made out of the down of the bog cotton, and the other a fabric manufactured from the fur of the white or alpine hare. Both of these products, however, may be considered of a fancy nature, as it is out of the question that the raw material should ever be supplied in sufficient abundance to make its spinning and weaving a regular means of employment. Knitting is another species of textile industry, which is being extensively introduced in the North by the proprietor of the Highland stall, and also, we believe, by Mrs. Mackenzie, of Gairloch, who takes measures for the transmission of the domestic labours with the knitting-needle of the people over a vast district of the north-westerly coast to Glasgow, where the stuffs, admirably warm, fleecy, and honestly made, command good prices. Mr. Macdougall has 600 or 700 women employed in the production of similar articles, and copious specimens are exhibited in his stall. The fleecy hosiery of the Shetland Islands, entirely wrought by the hand, has long enjoyed a very well-merited pre-eminence, and is known as an article of commerce. The manufacture now appears likely to spread to the mainland, and the knitting-needle, in company with the hand-loom, will, no doubt, be found capable of materially increasing the scanty comforts of many a smoky bothy. The very rough piece of woollen is stated to be from St. Kilda, the furthest from the shore of the British subsidiary isles, and to have been worked in a rude machine constructed in the island; and some mits and warm gloves are shown, which have also come from that hyperborean locality.

Altogether, then, the Highland stall is, to a great extent, satisfactory. It presents us with favourable specimens of certain infant local industries, and affords samples not only of new materials of textile manufacture, but of new ways of combining and colouring them. We could have wished for a collection of Highland agricultural and fishing implements, and of specimens of the ordinary furniture of the bothies, to show the low and degraded condition in which, as regards physical comfort, the people are living; but, in the absence thereof, the sketch of that public spirit which, in other districts of the island, is so strong, we can only so far congratulate ourselves, that a single individual has come forward to exhibit at least one phase of the industrial Highlands, composed, indeed, almost wholly of infant efforts at production—but which are so excellent of their kind, and so promising for the future, that we can only hope that an extensive and extending demand will reward the efforts of the promoter and the labours of these workpeople of the far north in their new and experimental career.

Since the foregoing was written, the following memorandum has been published. It is a good step in the right direction:—"An order has lately been issued by the military authorities, that the 42d, 78th, 79th, 92d, and 93d Highland regiments, which wear the kilt, are in future to wear the Glengarry bonnet instead of the Tam-o'-shanter as hitherto worn; but the 71st, 72d, and 74th Highland regiments, which wear the trow, or trowsers, are to continue to use the old pattern forage cap."



STAFFEL'S CALCULATING MACHINE.

STAFFEL'S CALCULATING MACHINE.

In the Russian Court, modestly secluded, amidst the glitter of malachite doors and vases, jewellery and silver, there is one work, the produce of high intelligence, and intended to assist in certain intellectual labours. This solitary tribute of mind to minds comes not from Petersburg, nor Mexico, nor from Siberia, nor the Ural Mountains; but from Poland. We refer to Staffel's Calculating Machine, No. 148 in the Catalogue.

The inventor of this machine, Mr. Israel Abraham Staffel, a native of Warsaw, was early in life apprenticed to a watchmaker. In applying himself to his trade as an occupation that should gain him his livelihood, he at the same time contracted a predilection for mechanics. His genius conceived the possibility of accomplishing a higher and more scientific aim than the finishing of the movement of a watch. He took to reading the works written on mechanics, both in German and Polish. With this study he combined mathematics; and these two studies—in which, by perseverance and assiduity, he attained a proficiency—begot the desire of inventing a machine, which, after many attempts, he has so successfully accomplished. Various attempts having been made within the last two or three centuries to invent a calculating machine, which attempts, however, were crowned only with partial success, Mr. Staffel started with a courage and self-reliance worthy of the final success that crowned the labour of ten years' undiminished application and study. No obstacle that came into the way and protracted the accomplishment of his favourite idea, could diminish or cool down the ardour with which he was bent on the realisation of this one great idea. *Finis coronat opus*; and at last he attained that great end which repaid him for all the toil, time, labour, and money he had expended.

Mr. Staffel's machine was sent to the exhibition at Warsaw; and the committee, in their report, No 333, drawn up by Messrs. Adrian Krzyzanowsky, A. Barnard, J. Bayer, Professors of the Academy, expressed their high approbation of the invention, and placed the machine for its correctness in calculating and its efficiency, above all others that had been previously constructed, of the eminent Mechnitz and Pascal included. The committee awarded to Mr. Staffel the silver medal; and, after expressing their approbation of the usefulness and importance of this invention, they conclude by saying, that Mr. Staffel deserves the highest reward and support.

For this support and appreciation Mr. Staffel did not look in vain. The Prince Paskewitch-Erivansky, Lord-Lieutenant of the kingdom of Poland, having been made acquainted with this important invention, sent for the inventor to produce his machine at the viceregal court, and having by ocular demonstration convinced himself of the importance of

the invention, enabled Mr. Staffel to present his machine at the Imperial Academy of St. Petersburg, who reported in its favour. Under the same high patronage he was afterwards presented to the Emperor, who was so gratified with his invention that he ordered a sum of 1500 silver roubles to be paid to him as a gratification, out of his private purse.

We subjoin a translation of the Report of the Imperial Academy of Sciences, upon this invention being referred to them as above stated.

"The Academy remembers that Mr. Slominsky, of Byalostok, presented to it last year a calculating machine, made upon a new and curious system as to the theory of numbers. The Academy did not hesitate to evince its approbation of the invention by awarding to the inventor half the Demidoff prize. Notwithstanding which, it must be confessed, that, however ingenious Mr. Slominsky's calculating apparatus may be, so far as regards theory, there still remains much to be desired relative to its practical application. Thus, for example, in multiplication it only furnishes the product in simple units, and the addition of partial products remains to be made in the usual manner, or by means of another instrument.

"The new machine that Mr. Staffel has just presented to the Academy is not subject to this inconvenience. The four elementary rules of arithmetic, besides the extraction of the square root, are perfectly effected, and with remarkable simplicity.

"Mr. Staffel's machine is not grounded, as that of Mr. Slominsky, upon any particular principle of numbers relative to multiplication, but entirely founded on different mechanical processes, the conception, action, and precision of which, in regard to their execution, sufficiently testify to the talents of Mr. Staffel.

"The inventor has displayed the whole of the machinery before us, in order to enable us to judge correctly in what manner the different mechanical movements are combined. These combinations appear to us as simple as they are ingenious. We, at the same time, convinced ourselves that the machine in question has the great advantage of being formed of very many simple pieces, which perfectly dovetail with each other, and which might be perfected more advantageously by means of a machine than by the hand of a workman. Consequently, the price of Mr. Staffel's machine would decrease as the demand for it increased; but this price would be still too high for the generality of persons, if only a small number of the machine should be required.

"We need not enter into any detail relative to the description of the arithmetical machine of Mr. S., as the inventor himself has shown us a detailed account of it in the Russian and Polish languages. Mr. S. has also exhibited before the Commissioners a small mechanical machine to execute the two first arithmetical rules in fractions, having for their denominators the numbers 10, 12, and 14. A machine may be constructed for all other denominators. The idea of the apparatus is very ingenious for practical purposes, and may also be examined (*elle pourrait aussi se présenter*).

"The inventor has shown, that, in all its relations, the arithmetical machine of Mr. Staffel merits the praise and approbation of the Academy, and that it will be found very useful when long and difficult calculations, and principally when multiplications and divisions, ought to be made with rapidity and precision. They also think that it will be but right to recommend Mr. Staffel to the particular notice and favour of his Excellency the Minister of Public Instruction.

(Signed) "V. BUNIAKOWSKY.
" . . . IA OSTI

Without perplexing the reader with varieties of mechanical details, we will now give a very general description of this interesting and important machine

The machine is of the size of an ordinary toilet; the mechanism is 18 inches by 9, and about 4 inches high. The external mechanism represents three rows of ciphers. The first and upper row, containing 13 ciphers, is immoveable; the second and third, containing 7 ciphers each, are movable. To the right is a semicircular ring, containing the words Addition, Subtraction, Multiplication, Division, and Extraction Underneath is a hand, which serves as a regulator for the operation, by pointing *de bâtons* to either of the four rules or the square root, which ever is to be worked. The advantages which this machine has above others are as follows:—

1. That the four rules and the square root, with fractions, can be worked by means of a curved handle (which in itself is a piece of mechanism), showing the various sums alternately, without being obliged to note down any auxiliary figure, as is the case with all other calculating machines.

2. That the compound rules, as the rule of three, of five, &c, can be worked simply by transposition of the regulator, without shifting any of the figures.

3. That, if by subtraction a larger number is subtracted from a smaller, the sound of a bell is heard, indicating the false proceeding; and when turning the handle a *negative number* shews itself in the upper row, where, instead of the 13 ciphers, the figure 9 will appear in their place, and which, added to the number given, will *prove* the inverted position of the *bâtons* to either of the four rules or the square root, which ever is to be worked. The advantages which this machine has above others are as follows:—

4. That the entire mechanism is of a simple construction, the parts acting without springs, its correctness and accuracy secured, and the efficiency of the mechanism guaranteed.

Mr. Staffel exhibits, likewise, an apparatus for assaying precious metals and ascertaining their alloy, without subjecting them to a solution by fire or any chemical process. He has also a calculating machine for working fractions; and the simplicity of its construction and the correctness of its results must astonish every beholder.

HARDWARE:—STEEL PENS.

On the south side of the English Nave, nearly opposite the statue of Shakspeare, and under the head of "Hardware," the visitor to the Exhibition will find some handsome-looking and elaborately-arranged cases, devoted to steel pens. Readers—shall we add writers, and even writers who write with steel—are not, generally, aware of the extent or the importance of the manufacture which supplies them with these invaluable little implements. We propose, before indicating the principal contents of the cases to which we refer (and of some similar ones in a remote part of the Building) to give a few details upon the subject of the steel-pen manufacture

We are, unluckily, old enough to remember the time when the steel pen was by no means a respected article. Elegant dealers in stationery did not sell it at all. You might see the mean-looking, sordid, black bits of split pipe in dusty brown chip boxes in the windows of the vendors of single quill pens, "pennyorths of ink," and red wafers; and we have in our younger days bought a similar article at an ironmonger's, the grimy drawer into which the pens were huddled containing one compartment for them, and one for gimlets. And what abominable things the old black pens were! how they cut into the paper; how they splutfered; and how more frequently they refused to write at all; and we took a file, or some such gentle appliance, to soften their nature, and so finished them outright! And yet, villanous as they were, how people housed them. A pen was a pen, even though it would not do one of a pen's duties. It was an iron fact, and people did not like to throw it away. So, when utterly condemned (having caused, during the helpless attempts to make it write, more objectionable language than even one of the "never mended pencils" of our own day), its owner would lay it away with scores of other similar *condamnés* in the inkstand drawer, whence, after a time, it was sure to be again brought out for the torment and aggravation of some succeeding writer. There was certainly a superstition against throwing the worthless article. And, at the time we speak of, how few people cared to use the steel pen. The poor bought it, and it gradually grew into use for commercial purposes among the inferior tradesmen. But the writing master loftily scorned it; and our own, we remember, declared that "it was expressly calculated to destroy all ease of wrist." The veteran clerks in old houses would as soon have thought of desecrating their employers' books with a skewer; and as for an aristocratic merchant laying aside his goodly white, big-barrelled quill pen, the mere thought had a sacrilegious flavour about it.

Not that there was not an exceptional manufacture, either at the time we speak of or shortly afterwards. The black pen was a plebeian affair, and, what was worse, was so impracticable. But there was a variety in the manufacture. There was a Mr. Perry, who made steel pens at all; and we twenty years ago, and who (we know) are to be seen in the Crystal Palace itself. He made some metallic pens, which, in their way, were then considered gems. The Perrypen—that was the name was really a blessing. We well remember the puff published by Mr. Perry, costly as it was, for we used to buy it of a retailer for the large sum of sixpence (the wholesale price of *three gross* of common steel pens)—was a treasure indeed. It quite made you in love with the mechanical work of writing; you were glad when the time came for getting to the desk; and you looked affectionately at your own delicate upstrokes, and manly down-strokes, and pitied poor people who had never learned to write. We wonder whether any created pen—any device which even Mr. Perry himself, with his twenty years of additional experience, could furnish, would produce that sensation for us now. But, at the time, this pen, "dear as it was, and justly dear," smoothed our calligraphic way, as, no doubt, its cheaper successors are doing for thousands of grateful scribes.

Time went on, and the metallic pen rose in the world. Elegant stationers began to sell it—apologetically, perhaps, at first, and hesitatingly: We are forced to keep them, ma'am, for some parties ask for them; but I would recommend you this box of quills"—twelve nice yellow pens for three shillings, including a view of the Pavilion at Brighton on the lid of the box. Then the elegant stationer began to sell the steel without an apology; nay, instead of commending with your objections, actually advocated the article, and convinced you of its excellence by stating that Lady Fitzcholmondeley took some only yesterday. The pens began to be sorted; the days of the drawer of pens and gimlets were over; hard pens were set apart for strong writers, and flexible ones for fine writing. The card system came up; and the pens, fastened up like crows over a barn door, hung in goodly rows, blazoned around with flourishes. Next they began to have names, and this was a great step to their social distinction. We had Magnum Bonums and Extra Fines; and Stylopti mos and Curreatecalamos, and all sorts of heathenishly baptized marvels. Meanwhile the manufacture itself was improving enormously; pens were being made better and better, and being sold cheaper and cheaper every day: and whereas, says a writer upon the subject, "about the year 1820 and 1821, the first gross of three slit pens was sold wholesale as the rate of £7 4s. the gross; the cheapest pens are now sold as low at *twopence* the gross, and the price rises with the elasticity and finish of the pen up to 3s. 6d. and 4s. per gross."

With this slight sketch of the history of the steel pen, we propose to our readers to accompany us to the stand to which we referred at the outset of this paper. Immediately on entering from the Aisle, we are confronted by cases (Cat. p. 111, No. 324), the property of Mr. J. Gillott, inventors and manufacturers. This is the gentleman of whom we have spoken as the great originator of all kinds of improvements in the steel pen, and who, nevertheless, considers the manufacture to be yet in its infancy. The case before us is completely traversed by a great pen, in tempered steel, a good yard long. This is quite a titanic article, such a one as Prometheus might have used, had he condescended to petition Jupiter from the Indian Caucasus. In contrast, there lies beside the case, fastened by a fantastic-looking chain of coloured pens, a little frame, in which, under glass, are 144 pens, weighing one ounce. If the fairies ever take to writing "Lives of the Queens of Fairy land," they know where to come for the implements. The large case itself contains a countless variety of pens, of every form, and size, and colour. Some of them are plain and business-like, others seem of the most fragile and cobwebby description. One set are so stamped out, that the body of the pen is little more than a piece of net-work; and, although, no doubt, it is stronger than it looks, the article was, we suppose, struck to show the delicacy of the moving power possessed by the punch. Others of these pens bear the heads of her Majesty, Prince Albert, and the Duke of Wellington; and this reminds us of a circumstance mentioned by the correspondent of the Journal to which we have had so frequent occasion to refer. One of his mental neighbours, he informs us, make steel pens subservient to political purposes, not simply in their uses, as other people might do, but in their pattern. The ultra-republican dealers order pens to be decorated with the head of the goddess Liberty, with the Phrygian cap, or with the words *Républicains Français*. The Bonapartists order pens with the head of Louis Napoleon; while the Legitimists strive to render the countenance of the Count de Chambord familiar to the public by the same means. The Italian republicans also endeavour to keep up the anti-Papal enthusiasm, and the spirit of Carbonarism, by the Pio means. This writer adds, a new union between Captain Sword and Captain Pen, and one which was certainly impracticable before the steel pen was invented, for we suppose that none of the enthusiastic partizans the above writer mentions would care to spend his leisure in the pen feather of a goose. Looking on through Mr. Gillott's collection of steel work, we find some exceedingly beautiful specimens of colouring, and some pens ornamented in every way, some with splendid spots, others studded with raised adornments like jewels, and some very tastefully embellished with flowers. Of course all this is the mere fancy-work of the manufacture, and it is very pretty to look at; and, unlike many exertions of "pretty taste," the manufacture has earned a right to indulge in it. Mr. Gillott puts a case here which pleases everybody's eye with its variety of form and colour: let everybody who looks at it regard it as a memorial, that the same machinery which produces these apparent toys, produces a gross of pens for twopence, and a gross of pens as admirable, if not as elegant, as anything here, for five shillings. The case is, however, not filled merely with ornamental pens: we observe representations of every variety of the practically useful article; and, in short, the whole history of the manufacture is told out under that glass to an eye that chooses to read it

The neighbouring case (325), exhibited by Messrs. Wiley and Co., is scarcely within the limits of our examination, as it contains metallic pens of other materials than steel. But, inasmuch as we learn that the exhibitors (a) manufacture of a silver pen [a] the smallest steel pen manufacturer in Birmingham to essay the productions now so famous, we think the silver, gold, and other expensive pens in this case (some of which are tipped with iridium and osmium, the hardest of known metals) should be included, as a sort of tribute of filial gratitude, in this notice. Some of them are beautifully mounted, and are excellently adapted for presents.

The names upon the third case (326), those of Messrs. Hinckes, Wells, and Co., of Birmingham, are quite as well known in connexion with the steel pen manufacture, as that of Mr Gillott. The attention of these gentlemen (like that of Mr. Gillott) to the comfort and morals of the great mass of workpeople under them, is most exemplary. There appears to exist between the employer and the employed that cordiality which it is so desirable to see; there is no ostentation of patronage on one side, no affectation of familiarity on the other, but there is that sound mutual feeling which arises from mutual respect and regard. The display made by this firm contains, in addition to a variety of pens of every description, useful and ornamental, the steel in its flat form and in subsequent conditions, so as to elucidate the processes of which we have attempted to give an idea; and as one of the curiosities of the manufacture, we find a series of nutshells, in each of which is deposited an incredible number of (infinitesimal) pens of great finish, which it requires the aid of a microscope properly to appreciate.

Messrs. Bell (327) exhibit a great variety of steel pens of all sizes, showing their forms and qualities, with improvements understood to emanate from the house in question; and Mr. Mitchell (328) has an extensive assortment of pens, black, gold, silver, blue, and brown in colour, some with large barrels and some without barrels.

Messrs. Myers (332) have a very gay case, in which we find pens illustrating our previous remarks. One set bear the figure of her Majesty for a body, another bears that of Napoleon. Among the inventions in this case connected with steel pens are feather holders, which consist of a handsome quill, into the barrel of which is inserted a small brass holder to receive the pen, so that, in theory, the flexibility and pleasant grasp of the quill are combined with the sterner virtues of the steel. We have some recollection of having seen and purchased a contrivance of this kind. We are unaware whether it was that of Messrs. Myers or not, but, be that as it may, we did not find the instrument very agreeable. For, the truth must out, we agree with Mr. Gillott in thinking that the art is yet in its infancy. The steel pens have unnumbered good qualities, and we have borne ample testimony to their social and domestic worth, but we have never seen a steel or other metallic pen yet, which, with all our determination to believe in it, really attained the flexibility of the quill. There is always a stiffness and a reluctance somewhere, which manifests itself some time or another. The iron nature will break out. No doubt, some day, we shall be presented with a pen which rivals our grey goose-quill in ease of working, but we have not as yet discovered such an article. Meantime, such a machine as that in Messrs Myers' case, is rather against our taking kindly to the steel. It deludes us into the idea that we hold a quill pen, and it is not until the steel refuses to yield to some of our scribbling vagaries, and wonders, in its Birmingham way, why we cannot write on in business-like fashion, making the best of it like the steel pen it is, and finishing off a dash, a flourish, or a curve more caught a Tartar. We do not know that the exceeding beauty with which Mr. Myers have finished some of these feather holders, putting the prettiest little medallions upon the feather itself, is not the pollution of the offence. We ought to add, that in this case there are some pen-holders of the most elegant description—porcupine quills, carnelian, mother-of-pearl, coloured and plain woods and plain, and one of the quill-holders aforesaid has an invention for discharging the pen without soiling the fingers with ink—a useful, when taught by well-instructed into the ordinary holder.

Mr. Mitchell (329) also exhibits various pens, and his case is remarkable for two enormous pens in imitation of gold, and for a Brobdignagian holder to match.

Before going up-stairs, we should remark, that in a court at the back of the department there is framed a work, which seems to have been placed there to controvert our view of the flexibility of the Steel Pen, and, at all events, to prove that it can do all that can properly be required of any pen in the world; this is a large pen-and-ink drawing, executed with one of Mr. Gillott's pens, in which a sacred subject is treated, and the Commandments, with a variety of other scriptural matter, are transcribed with exceeding neatness, and in every kind of small hand, large hand, and fancy hand, and all the texts wherewith old-fashioned writing masters were wont to embellish the cipherings-books of their pupils. It is executed very ably, but does not stagger our hypothesis, that, as yet, no metal pen will submit to a writer's caprices so unhesitatingly as a quill.

For some reason or other, the remainder of the steel pens are dissociated from their companions, and "beckon us to a more removed ground." After a long search for the productions of Messrs Perry and others, who, in the Catalogue, are placed in the Hardware department, we discovered them up-stairs, in the North Gallery, near the eastern. The alteration, of which some intimation ought to be affixed below, has been puzzling to many persons besides ourselves; and, but for inquiries instituted by one of the very intelligent police officers in the Building, we should not have found the remaining articles at all. Messrs. Perry's stand (687), when we did discover it, we found to contain a great number of capital-looking pens, to suit all hands; and doubtless many of them are the much-improved descendants of those for which, in 1831-32, we were glad to pay sixpence each. The pens are surrounded, appropriately, by bulwarks of inkstands, of the multifarious forms which Mr. Perry has been so long delighting to create

Messrs. Knight, of Eastcheap (689, 694), have also a goodly collection: among them is a pen to which the name of Mr. Paxton has been given; and, if we dared trust to names in these days, we should be tempted to order it, in the hope of finding it the very *beau ideal* of facility and rapidity

Messrs. Wyndle and Blyth, the Walsall manufacturers (668), exhibit some "compensating" steel pens among their different inventions: if we understand the word aright, it implies, at least, an endeavour to obtain an *incessant* flexibility—the one thing needful in these most useful little implements

We have now, we believe, glanced at all the principal features of the steel-pen manufacture, and have accompanied our readers to the stalls of the Exhibition where the manufacture is illustrated. Those who had not previously been aware of the importance of this department of our national industry, will not have found our details unacceptable. We can hardly bring our remarks to a more appropriate close than by citing the language of a writer in the *Morning Chronicle*, in reference to the social condition of those who are engaged in the manufacture He says: "Upon the whole, the manufacture of steel pens is exceedingly well conducted. The labour is not hard; it is much better paid than the labour of women generally. Children are not employed in it at too early an age. There is no sub-employing: all the workpeople are directly responsible to the manufacturers; and the work is not unwholesome. The workshops are light, clean, and well ventilated, and the principal employers are men who seem to understand thoroughly the duties which they owe to those dependent upon them for subsistence, and not to be contented with merely paying them their wages and taking no further interest in them. The manufacture is already large, and is daily increasing. The only subject of regret in connexion with it seems to be, that, out of so many hundreds of women employed in making the pens which all the civilized nations of the world use in recording their thoughts and their wishes, their business and their affections, so very few can make use of them. They can make pens by myriads, but they cannot write their own names. At every steel pen factory at which I inquired, the number of girls and women who could read was considerable, but the number of those who could write was very small."

This statement may remind readers of English classics of a poetical passage referring to certain other labourers in metals, whose workmanship was spitefully hinted at, by quotation of the following lines, in presence of a large company, in order to mortify a beautiful great-grandmother (perhaps) of ours, or of some of our readers. The lady's shape seemed too perfect to be natural, and her envious rivals sneered. The lover of one of them—we hope he was "winged," at least, behind Montague House, next morning—pointedly recited the verses, which, *mutatis mutandis*, might apply to the poor, ignorant steel-penmakers:—

> The Mulcibers, who in the Minories sweat,
> And under bars on solid anvils beat,
> Deformed themselves, yet forge those stays of steel,
> That arm Aurelia with the shape to kill. S. B.

LADY'S DRESSING-CASE. BY W. LEUCHARS.

This is a very admirable example of the extreme finish with which desks and dressing-cases, and other articles of boudoir luxury, are produced in this country, and in which, without a doubt, we stand unrivalled. This is a lady's dressing-case of walnut-wood, the exterior mounted in the Mediæval style, in pierced solid silver, enriched with gilt knobs and pins, and relieved with cannel coal, which has almost the hardness and polish of jet. The interior is fitted up with great magnificence and completeness, the bottles for perfumery, &c., being richly cut, with massive chased silver tops, parcel gilt, the ivory brushes covered with ornamention, and rendered complete for use by a swing glass, of new pattern, in a silver frame.

CARVED ESCRITOIRE, AND TABLE, FROM SWITZERLAND.

The Swiss department contains several specimens of wood carving, in decorative furniture and otherwise, which are interesting for the great amount of executive skill displayed upon them, and for the truthful homeliness of the subjects represented in them. They are, indeed, for the most part, sculptured bucolics, exhibiting the pastoral life of happy Switzerland in all its various phases; while a few illustrate other points of nationality—as the costumes of the twenty-two cantons, still kept remarkably distinct amongst the rural population; or some spot dear in the memories of Swiss-men, as the chapel of William Tell, at Altdorf. There is something very charming in the simple devotedness to a beloved nationality thus evidenced by a brave, industrious, and primitive people, in their contributions to the world's great and glittering fair. The escritoire, by Wettli, of Berne, which [illegible] represents is in white wood, and is contrived for the use of a lady [illegible] observed that it can be used either in a sitting or a standing posture. The embellishments, as already stated, comprehend various passages in the industry, field sports, and amusements of alpine life. The general style of this piece of furniture, considered as such, is light, and by no means inelegant. The small table, by Schild, of Berne, is also extremely pretty, and both are well suited for a lady's boudoir in the retirement of a rural hour.

KISSELL'S MECHANICAL INVALID CHAIR AND BED.

In our Illustration of Kissell's invalid chair and bed, which is exhibited in the South-eastern Gallery, it is shown with the mattrass, bolster, and pillow in the progress of transformation from a chair to a bed, the main frame being constructed of three parts, which are connected together by joints in such a way that the whole is readily brought to a level when required, as shown by the dotted lines. The principal novelty, however, of the invention is the possibility of making a second bed for the patient under that on which he is lying. This is effected by a frame, with sacking, placed within the ornamented bedstead, covered with a mattrass, and elevated, by a winch in connexion with a rack and pinion motion inside, sufficiently high to enable the attendant to make a second beneath it: this done, the upper frame, with the mattrass, &c. on which the patient is lying is lowered towards the under bed, to which he is to be transferred, and the mattrass being divided longitudinally, and each division connected by bands with the side of the main central portion of the bedstead, the pins which connect the two sides of the divided mattrass are withdrawn, and the patient is delivered on to the lower bed, each side of the upper mattrass being of course removed by hand.

We have had the opportunity of seeing the whole process, a French [illegible] having consented to act as the patient, we are decidedly of opinion that no patient who might be subjected for *twenty minutes* to the noise, disturbance, and confusion on his removal from one bed to the other, would consent to be experimented on by a second trial.

THE "BASSINETTE FLIANTE."

Registered by Capper and Son, 69, Gracechurch-street, City, and exhibited by them in Case No 45, Class 20, is an invention by which are combined an improved form with facility of conveyance. An arch of some grace at the head, airy and lofty compared with the usual depressed forms, effectually raises the hangings above the infant's face; and, by a simple contrivance, this raised head, as well as the foot and sides, fold over the whole bedding, thus forming an oval *basket*, which, with its osier cover, measures but 12 inches in depth.

The hangings of the bassinette placed in the Exhibition are of elegant lace, made in the vicinity of Limerick; but these cradles may, of course,

BASSINETTE.—BY MESSRS. CARTER AND SON.

be obtained covered with more economical materials, and are so contrived, that, without removing these less fragile hangings, the bassinette is transformed, in one minute, from an open, airy cradle, to a compact

DIAGRAM OF BASSINETTE.

package of no more than one foot in thickness, and suitable for conveniently placing in a carriage. It has been not inaptly termed the "Bassinette de Visite."

CHANDELIER. BY CORNELIUS AND CO., PHILADELPHIA.

Although the exhibitors in the United States department chiefly distinguish themselves for works of severe utility, and in these with very remarkable success, there are not wanting amongst them some who have devoted their talents to more decorative productions; and of these Messrs. Cornelius and Co., of Philadelphia, are entitled to the first rank. Their chandeliers, candelabra, lamps, &c., exhibit great variety and beauty of design, excellent quality as to the materials (brass lacquered), and admirable workmanship.

The chandelier which we engrave measures 15 feet in height, by 6½ in width. It contains fifteen lights. The branches are composed of a succession of scrolls, from which hang bunches of fruit: the canopy is composed of flowers, intertwining in variegated forms the convolvulus and lily; and the body, though also richly ornamented, displays great lightness, a point which the designer has aimed at in all his works, and with great success.

The lard lamps exhibited by the same firm display remarkable richness of colour, and commendable beauty of form. They are so constructed as to convey a large quantity of oxygen to the combustion point, to the great improvement in the colour and brightness of the light produced. They are said to be in general use in the United States. We understand that these exhibitors constantly employ nearly 700 operatives in the various branches of their business.

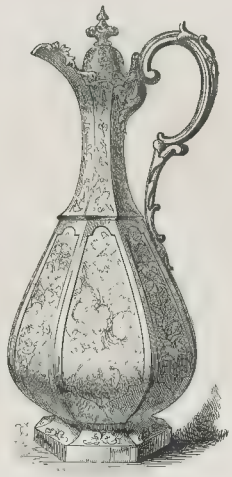
INKSTAND. BY SLATER.

This is an inkstand in dark wood, carved with various fanciful devices —an owl's head, snake, sea monster, &c., the general effect of which is striking and handsome.

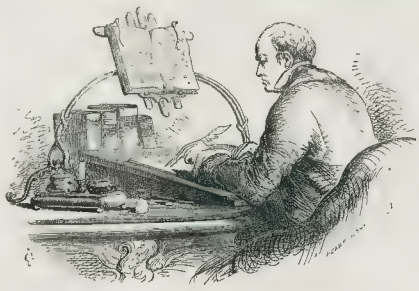
SILVER CLARET JUG. BY DODD.

A very elegant specimen of silver work, engraved and chased.

GROUP OF CHINA.—BY MESSRS. ALCOCKS.



SILVER CLARET JUG.—BY MESSRS. DODD.



THE "IRIS." BY HUXLEY AND CO.

INKSTAND.—BY SLATER.

GROUP OF BOOKS.—BY LEIGHTON.

THE IRIS, BY MESSRS. HUXLEY AND CO,

Is an adaptation of the plan adopted in many offices of suspending against the front of the desk any paper requiring to be hastily copied in duplicate. In this form we have an instrument by means of which invalids confined to a reclining posture, the student of geography or languages, the literary man (which includes all engaged in business), and the artist, may enjoy the power of reading in an easy position, and, if desirable, of glancing from one document to another, without moving the head.

GROUP OF CHINA. BY ALCOCK AND CO.

The ornamental china exhibited by Messrs. Alcock and Co., of Burslem, comprises many very beautiful and original specimens after designs by Alfred Crowquill, S. W. Arnold, and San Giovanni. They consist of jugs and vases, of various forms, and other table ware, besides all sorts of fancy articles, as pen-holders, ring-holders, ash-trays, centre-pieces for flowers, and fancy statuettes. The vase with flower ornaments, in the centre of our Engraving, is of very exquisite workmanship; remarkable for delicate accuracy of outline and richness of colour.

GROUP OF BOOKS. BY LEIGHTON.

Messrs. Leighton's fancy bindings have already been frequently alluded to, and have attracted much attention from those who are curious in the outsides of books. In the choice of materials, devices, &c., it is attempted in every case to adopt emblems or hieroglyphics descriptive of the subjects of the contents, or at least involving a pun upon the name of the author. Miss Bennett's "Hints on Colour" is decorated with a painter's palette, with colours. The Royal Cambridge Bible, of which the late King pulled the first proof before the heads of the University, is bound in morocco, and tooled with national emblems, the clasps being formed of anchors and cables, in honour of the "Sailor King." Vernet's "Life of Napoleon"

RED CORAL AND BRACELET.—BY PARAVAGNA AND CASELLA.—(SEE NEXT PAGE.)

is bound in tri-coloured morocco, the edges diapered with bees ascending and *fleur-de-lis* reversed, typifying the rise of Napoleon and the fall of the Bourbons. "Bacon's Essays" we find bound in hog-skin, and so forth. There are few of the "curiosities of literature" which do not speak highly for the taste and good sense of those who patronise them, and will probably pass away with other frivolities which live but their little day.

CORAL ORNAMENTS. BY PARAVAGNA AND CASELLA.

RED coral has, from time immemorial, been used as an ornamental material in jewellery in all parts of the world, in beads, brooches, drops, bracelets, charms, studs, and many fancy contrivances. The price varies from 1s. per oz. up to £5 and £20 per oz. The best colours are considered a bright red or pale pink: the latter is most scarce. We must not confound with this substance the coral reefs found by mariners, as they are nothing but a spongy white rock, having no analogy whatever with the real red coral. The fishery of the real coral is carried on in the Mediterranean Sea. The largest samples are taken along the Barbary coast, but not the darkest colours. Along the coast of Spain a considerable quantity is taken annually, of a deep red colour, but sometimes rather wormy. The pink and deepest red, but in comparatively small branches, are taken in the Straits of Bonifacio, between Corsica and Sardinia. The amount annually taken varies from £100,000 to £200,000, the principal stations for the fishing smacks being La Torre del greco, near Naples; Leghorn; and Santa Margherita, near Genoa. The total number of boats is about 200, and they stay about six months on the voyage, starting in February, and returning in September. Coral is found in branches varying from one pennyweight to 20 or 30 oz. in weight, and sometimes even more. Samples of this bulk are considered great curiosities, and are of proportionately high value, being very scarce. The principal manufactories of coral are at Genoa, Leghorn, Naples, and Marseilles, in Europe; and in China. This article is supposed to give employment to from 10,000 to 20,000 hands. The specimens which we engrave in our present sheet are from the establishment of Messrs. Paravagna and Casella, at Genoa, who employ 400 work-men. The principal object is a superb, and, for its size, almost unique branch of rough coral in its natural state.

FLAX MANUFACTURES.

OF late years there has existed in the public mind a decided tendency to return, in a great measure, to the use of linen as an article of clothing. The precarious nature of the supply of cotton, and the utter state of dependence in which our cotton manufacturers are placed, through the neglect and inertness of those who ought to have encouraged the growth of the cotton plant in our East Indian possessions, have led many thoughtful minds to the conclusion, that the best thing they could do, both for themselves and the agriculturist, would be to encourage the growth and preparation of flax, especially in Ireland, as the uniformly moist character of the atmosphere is peculiarly favourable to the full growth of the flax plant. Nor was the neglected and uncultivated condition of large tracts of that country overlooked in this question, inasmuch as it was felt, that, could the system of flax culture be again fairly introduced, it would do much to supply the many deficiencies which at present exist in the employment of the people, tend to render them and the natural advantages of their country more useful, and raise them to a higher social scale. The efforts of the present Lord-Lieutenant of Ireland have been specially directed towards the encouragement of flax cultivation. Aided by the exertions of the Royal Flax Society of Belfast, and the private efforts of some of the more enterprising of the landlords in the south and west, a beginning has been made, which, political or religious agitation permitting, will do much towards developing those resources in this department of agriculture which Ireland, above all other countries, possesses in such abundance. Nor has the probable successful and profitable growth of flax been overlooked in Scotland and England; and many cases could be quoted of the profitable results arising from experiments instituted by intelligent agriculturists. One great objection, in England at least, appears to be the exhausting character of the crop, rendering constant manuring requisite. This is the objection of the agriculturist, and the only one which appears to be advanced with any degree of truth, but then it is a most important one. The manufacturer, too, has his objection to the extensive introduction of flax, particularly in a cheap form, and as calculated to supersede the use of calico. The machinery used for cotton spinning is of a totally different character from that used for spinning flax, and the general introduction of the latter would inevitably tend to throw the cotton machinery out of use. To remedy this, M. Claussen's method of preparing flax has been brought before the public. This prepares flax in such a manner as to render it like cotton, and the inventor calls it "flax cotton," which end in this state it is capable of being spun into yarn by cotton machinery, retaining still its cool and anti-absorbent character as flax. The conflicting opinions we have heard from some of the most eminent manufacturers, not only of England but the Continent, as to the merits of this invention, cause us to pause before giving any opinion of our own on the subject. That the fibre is reduced, and made into a woolly substance similar to cotton, and that it is spun by cotton machinery, and cloth, "flax calico," if we may use the term, made therefrom, is quite certain; but then its value, in an economic point of view, is another question, on which, as yet, manufacturers are by no means agreed. One declared to us, that he should consider it just as wise and as economical for the chemist to convert gold into lead, as this work in flax on a large scale into a material like cotton. The fact, however, remains, that, with a sufficiently abundant supply of material, our cotton machinery may be used in the manufacture of flax.

Under any circumstances, the increased use of linen is a fact of the greatest possible importance to, at least, one most important manufacturing community—that of Belfast and the province of Ulster; and we have no hesitation in saying, that the display of the skill and industry, to say nothing of artistic talent, which the manufacturers of the North of Ireland have done themselves and their country the credit to make in the Great Exhibition, will have a lasting influence upon their future trade. Few persons believed that Irish industry was carried to such an extent, even in the north, as it is proved here to be, and fewer still that such beautiful specimens of damasks and cambrics were manufactured in Ireland. Plain linens, of course, every body knew, were made in perfection; nor should the fact be overlooked, that, in consequence of the successful efforts of the manufacturers of Belfast during the few past years, British capital has begun to flow in that direction, and that during the last two years several large mills have been erected by English spinners at a cost of £250,000 in buildings and machinery. Of course, the employment thus afforded to the people of the districts in which these works are erected, must be useful and permanent.

CAMBRICS.

The cambric trade of Ireland has improved from time to time to such an extent, that for some years past it has been questionable whether or not the largest amount of those productions sold at English markets as French cambrics are not produced in Ireland. In the article of pocket-handkerchiefs alone, it is quite certain that many tons weight per annum of unbleached Irish cambric finds its way to France for the purpose of bleaching; but it is a singular fact, that it never appears to be returned when that operation is effected. It will, of course, be readily understood, that, in a delicate fabric like this, the peculiar atmospheric advantage of a country like France must be of great value; but the bleaching process, but how the operation constitutes the manufacture of the article, is a species of logic we have never yet been able to comprehend. In short, it seems pretty clear, that French cambrics are generally made in the north of Ireland. The exhibition of this article is confined to three or four exhibitors. Mr. J. Malcolm, Lurgan, Ireland (22), shows beautiful specimens of linen, cambrics, and clear lawns, as also shirt frontings, and hem stitched handkerchiefs, all being of a very superior quality. Messrs. J. and T. Richardson, also of Lurgan (21), exhibit similar productions;

looms for the purpose of working up the raw materials raised from the superior seed he had previously imported.

The state of the manufacture in the countries whence we derived our trade in linens does not appear to be in so flourishing a condition as might have been expected, under the pressure of the great movement now going on in favour of manufactures; since, possessing all the facilities for raising the raw material and all the traditionary knowledge of its preparation, it might have been expected that more would have been done.

BELGIUM.

The damasks exhibited by M. P. Verriest, of Courtrai (214, Belgium), are of a coarse but effective character, and are such as would be used for every-day use. M. C. Dejardin, also of Courtrai (217, Belgium), exhibits napkins of very fair design, one being a specimen of that kind of weaving against which we have pronounced so strongly, since it represents, or is intended to represent, the King of the Belgians on horseback. M. T. Demuter, of Alost (232, Belgium), exhibits specimens of excellent character in weaving and respectable design, the portions of ornament being good; but, as usual, the weaving of the human figure comes in to mar the excellence. This exhibitor shows some cambric handkerchiefs of good quality. M. B. Hannes-Bines, of Vilvoide, exhibits damask examples of a similar character, to which the same remarks may be applied. The bleached examples are admirable.

There are one or two other exhibitors from Belgium who exhibit coarse and serviceable damasks and diapers of good character, the design being generally very fair.

AUSTRIA.

The Count Harrach, of Janowitz, Moravia, and Starkenback, Bohemia (285, Austria), exhibits very excellent examples of linen furnitures, the designs of which are generally highly appropriate, being woven in a variety of colours, but all of such a character as to suit the material. The adaptations to hangings and window-curtains are well managed, and our manufacturers may take a hint therefrom, which with taste and skill may become useful to them. The bleached examples of the small cloths and napkins are excellent, and the taste in design far above the average of these kind of goods. The printed examples, too, are novel and well executed.

The Benevolent Society of Milan (Pia Casa d'Industria—283, Austria), exhibits bold and effectively designed coarse damasks, and there are some excellent linen ginghams exhibited by John Lang of Vienna (185, Austria.)

From Ullersdorf, near Schönberg, Moravia (96, Austria), there are presented some specimens of raited flax, whilst Russia largely exhibits the raw material, as well as hemp, and specimens of cloth of a coarse but varied quality manufactured therefrom.

ZOLLVEREIN.

The states of the Zollverein display some admirable specimens of flax manufacture in various forms, the coloured specimens being of a novel and excellent character. M. Kauffman Schweidnitz (193), exhibits coloured damask for hangings exceedingly well designed, chiefly in stripes. Christian Dierig, Langenbielau, Silesia (92), also exhibits Jacquard woven damasks in stripes, the patterns and colours of which are well selected; indeed, some of the designs are peculiarly elegant and appropriate and in great variety.

A. H. C. Westermann and Sons, Bielefield (543), exhibit a good assortment of bleached damasks and diapers of good character, the designs being occasionally very elaborate and elegant. The display of the larger examples shown by this house is a very effective one. The designs are generally broad, bold, and artistic, and when not tempted to get into the routine course in the introduction of animals, the whole are in excellent taste. The Byzantine design is admirable, and the heraldic portions of one or two remarkably clear and effective.

Erben Anton Eichholt, of Warendorf, Westphalia, shows small cloths, all of which are excellent specimens of weaving: the borders are admirably drawn and designed, and are perfect models for our designers of damasks. The centres of these cloths, however, are architectural representations of Cologne cathedral, and Scott's monument at Edinburgh. They are drawn and woven with wonderful precision, but had no business to be executed in such a fabric.

On the whole, the display of linen damasks is an interesting, though by no means an attractive one; and the probabilities are, that thousands have visited the Exhibition who have never thought it worth while to look at any of the examples, yet in no department has there been more skill and talent displayed than in these unostentatious products of the loom.

CAPTAIN ERICSSON'S PHILOSOPHICAL AND OTHER INSTRUMENTS.

THE name of Ericsson is well known in the mechanical world. In connexion with Mr. Braithwaite, he competed for the prize offered by the directors of the Liverpool and Manchester Railway, for "the best locomotive engine which should draw on a level plane three times its own weight at ten miles per hour." An account of this engine is given at page 195, No. 509, of the ILLUSTRATED LONDON NEWS.

Captain Ericsson has for many years past resided in the United States of America, and has continued to engage himself in mechanical pursuits, and to produce many ingenious and useful inventions: among these we may especially notice the distance instrument; the hydrostatic gauge; the reciprocating fluid meter; the alarm barometer, and the pyrometer; all of which are exhibited in the United States division of the Great International Industrial Exhibition.

The distance instrument is intended especially for the use of naval men in ascertaining distances at sea, and consists of a reflector similar to that used in quadrants, which is firmly attached to a spindle, an object glass, and a sight, by which the necessary angles are measured. The spindle is turned by a lever, at the lower end of which is a slot, in which a sliding nut moves freely up and down. In the sliding nut is fixed a thumb-screw, furnished with a pinion which works into cogs formed in the circumference of a graduated index plate, which plate is attached to a socket sliding on the main stem of the instrument. The index-plate is graduated into feet or yards, and the scale is found by taking the supposed height of a given mast as the base line, the tangent to the earth's curvature being determined accordingly; then, by dividing the curve between the bottom of the mast or vertical base line and the horizon into equal spaces—say of 10 yards each—commencing at a given distance from the vertical line, and calculating the sines of the various angles which are afterwards engraved on the index plate—the instrument is ready for use. When about to use the instrument, the object glass has to be adjusted so as to bring the real and reflected horizons in a line, and the point on the scale of the index-plate placed directly under the fixed index shows the required distance. For different-sized vessels, index-plates, with graduations to suit the various heights of their respective masts, will be required. An instrument similar to the one at the Great Exhibition has been practically tried by a distinguished naval officer of the United States, who, from an eminence on shore, was able to take the distances of various objects at sea with great precision, the height of the point of observation being in the first instance accurately ascertained.

The hydrostatic gauge is for measuring the volume of fluids under pressure, and consists of a thin copper sphere, of about 7 inches diameter, the interior being gilt. In the top of the sphere is a conical steel plug, formed with a cavity, and ground accurately to fit into a proper collar attached to the sphere; a vessel is suspended inside the sphere, immediately under the steel plug, and in the bottom of the plug a small aperture formed in the side of a hollow projection. The *modus operandi*, as practised by the exhibitor, was as follows:—The sphere being filled with distilled water, carefully freed from air by protracted gradual boiling over the flame of a spirit lamp; the steel plug, with the suspended vessel, was then inserted, and the whole allowed to cool. The deficiency of water within, owing to its contraction in the process of cooling, was made up by an addition of distilled water. When the temperature was reduced to 60°, the sphere was placed in a strong iron receiver, filled with water of the same temperature as that within the sphere, the receiver being connected with an hydraulic press. Mercury having been poured into the cavity of the steel plug, the receiver was closed up by a strong cover, and the hydrostatic pressure applied, due notice being taken of the force exercised. The cover of the receiver being removed, and the small aperture in the steel plug closed, the latter was taken out, and the mercury in the vessel suspended within the sphere, on being weighed, furnished the exact amount of compression of the water in the sphere. The contents of the sphere having been previously ascertained, the ratio of compression was established with extreme accuracy. Such a delicate instrument is peculiarly adapted for determining with the greatest accuracy the rate of compression peculiar to fluids.

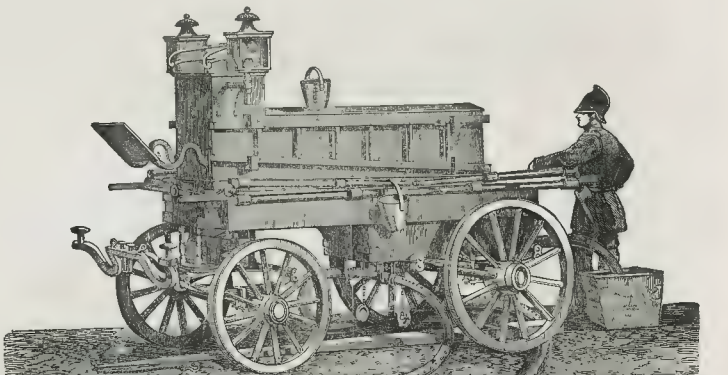
The reciprocating fluid meter.—This instrument, which is for a similar purpose to that of Tebay's water meter, described in No. 509 of the ILLUSTRATED LONDON NEWS, has been fully tested by the directors of the Croton aqueduct, New York, who have supplied it as a check on the quantity of water used by the large manufacturers and others supplied from that celebrated conduit. The meter is placed in the water itself; thus tight joints, packings, &c., are avoided. The measurement of the water is effected by two double-acting plungers connected to cranks working at right angles. The motion of the plungers is checked before the cranks reach the full up and down stroke, by means of stops acting directly on the plungers. In the piston-rods are oval slots, made so much wider than the diameter of the crank-pins, as to allow the latter to move through an arc of 20 degrees whilst the piston remains stationary. It is worthy of notice, that, as the meter works within the medium to be measured, an equilibrium of pressure is nearly established, so that friction and injurious wear of the moving parts are avoided. The meters are made of different sizes, those in use at the Croton Works having plungers of the respective diameters of 5, 9, and 21 inches. By the meter having 21-inch plungers, a quantity of water equal to 70,000 cubic feet is measured in twenty-four hours. A register of the usual construction is applied to the meter, which is set once a year, and the quantity of water which has passed through the metre is at any time ascertained by inspection. The accuracy with which the quantity of water is ascertained by its displacement by means of plunger of fixed size working between definite stops, cannot be questioned.

The principle of the alarm barometer is, that, so soon as the mercury sinks below any given altitude, the falling of the mercury causes a gong to be sounded. Thus, at sea, without being required continually to watch the decreased movements of the mercury of the barometer, the seaman is warned of the approaching storm, and is thus enabled to make preparations, by taking in the sails and observing other precautions. This instrument consists of a glass tube of the ordinary description, but which is considerably increased in diameter at its upper end: the lower end is dipped into a semi-globular cup containing mercury; the object of the enlargement of the glass at the top is to cause a large quantity of mercury to be discharged into the cup with a slight fall of the column. The gong is sounded by means of a hammer impelled by a spring, the mercury in its fall descending into the cup and disturbing the equilibrium of a lever, which disengages a catch connected with the hammer. The cup is equipoised by a weight adjustable on the lever, which is graduated for the sake of easy adjustment.

Captain Ericsson was led to the invention of his pyrometer by discovering that the Wedgewood scale was not to be relied on in a series of experiments in which he was engaged, and which required an accurate knowledge of the expansion of permanent gases under high degrees of temperature. The exhibitor has fixed 32° as the freezing, and 212° as the boiling points of water respectively; so that this standard should bear a direct relation to the scale of Fahrenheit. To the practical man, requiring at times the application of great heat in some of his processes, the instrument will prove a valuable adjunct. Towards the bottom of the instrument is a chamber containing mercury: the bottom of this chamber is composed either of spring steel or India-rubber held between steel plates, and is furnished with a set screw for moving the flexible bottom up and down. A glass tube, 36 inches in length, passes through the top of the mercurial chamber, and reaches to within one tenth of an inch of the bottom, being sealed at the top, and charged with mercury in the ordinary way. A short tube is inserted vertically in the top of the mercurial chamber communicating therewith, with which, by means of a passage of small section, a communication is made with a platina bulb: into the passage, which is furnished with a stop-cock, is placed a silver wire not quite occupying the entire section. In order that the air may be exhausted from the mercurial chamber and the platina bulb, either separately or at the same time, an air-pump is attached, the position of the stop-cock regulating the action thereof. Around the sides and top of the mercurial chamber is a cistern for pounded ice. By means of a screen formed of double plates of iron, the instrument is shielded and supported, the screen standing on a base-plate; between the plates, as described, the space is filled with clay or other non-conducting substance. The height of the mercurial column in the glass tube is shown by graduated scales in the usual way—thus indicating the tension and temperature of the medium in the platina bulb; all temperatures up to the melting point of iron are indicated. The instrument is made to stand in an upright position by means of a spirit level. For the mode of using this instrument, we may suppose that the melting point of silver is to be ascertained: we have first to detach the platina bulb by means of a coupling joint, and bring it to a red heat over the flame of a spirit lamp, with a view to get rid of moisture. In the next place, we must exhaust the air from the bulb, and re-charge it with azote or dried atmospheric air, and again attach it by the coupling joint. In the third place, a cup filled with powdered ice is to be placed under the bulb. Fourthly, the flexible bottom of the mercury chamber must be drawn down nearly to the extreme limit by means of the set screw, and then the air-pump applied, which by means of the necessary exhaustion will lower the barometer column in the glass tube, and cause mercury to enter the chamber, partially filling the space left at the top by the bottom being lowered, the chamber having, in the first instance, been fully charged. As soon as the high column shall have reached a fixed point on the vertical scale of the instrument, the bottom of the mercurial chamber is to be screwed up until the mercury in the shorter tube stands opposite *Zero*. As by elevating the bottom of the chamber a slight rise of the high column will take place, a further exhaustion will be required to bring it down to the fixed point as above, the short column being kept at *Zero*. In the next place, in order to shut off the communication with the pump, the stop-cock should be half turned, the ice should be removed from under the bulb, and its place supplied with boiling water. The effect of increased temperature will cause increased tension in the bulb, and the high column will be raised, while the short column will be lowered. By again raising the bottom of the mercurial chamber, the short column will mark *Zero*, and the high column will be brought to rest at some point on the scale. Now, by substituting a ladle of molten silver for the hot water, and nearly immersing the bulb in it, the high mercurial column will rise rapidly, while the short one will sink as before. The set-screw being applied as directed, and the short column retained at *Zero*, the high column will again come to a state of rest. The ladle being now removed, the operation is completed. By comparing the elevation caused by the boiling water with that of the molten silver, it will be easy to determine the degree expressing the melting point of silver above that of freezing, according to Fahrenheit's scale.

FIRE-ENGINE. BY M. MERRYWEATHER.

In this Engraving we have a representation of a carriage fire-engine, to be drawn by two or four horses, of the pattern employed by the London Fire Brigade (Simpkin's patent); fully equipped with 7-inch gun-metal cylinders, and spherical copper air-vessel; gun-metal pistons and valves in separate valve-chambers; handles for thirty men, which fold up fore and aft; improved wrought iron fire-carriage, patent axles and springs; double delivery screws, for attaching two lines of hose when required.



MERRYWEATHER'S FIRE-ENGINE.

THE GREAT GATHERING OF THE INDUSTRIOUS BEES, 1851.

How beautifully is the great Palace of Industry represented by Milton's "Mansion of Industry," placed in the North Transept Gallery, where more than two hundred thousand little labourers are diligently engaged in their various daily duties, while their reigning sovereign reposes quietly in her regal apartment, attended to by her subjects with the utmost regard to her comfort and convenience. It is not to be wondered at that there should be so many contributors of bees, beehives, and honey to the World's Industrial Exposition, when we remember how this highly interesting and important subject has attracted the attention of some of the best and wisest men of all ages, and how Virgil and other poets, in language so musical, should have related all the acts and doings of the bees—

> Creatures that by a ruling nature teach
> The art of order to a peopled kingdom.

The writings of Varro, Pliny, and Columella may be consulted with advantage on this subject. Indeed, Columella, who lived in the reign of Claudius Cæsar, wrote a complete treatise on the management of bees; and Varro, in his "De Re Rustica," gives the following account of the profit to be derived from bee-keeping: "Of the fruit or profit I have not only a witness, who says he lets out his bees for five thousand pounds of honey by the year, but also our friend Varro, who had with him in Spain two rich brothers, soldiers, to whom their father left a small country-house and a little field of about one acre near to the house; they formed an apiary, and also a garden, which was planted with thyme, cytisus, and balm. Taking one year with another, each profit from bee-keeping never amounted to less than 10,000 sesterces" (£83 6s. 8d. sterling).

The great architect of St. Paul's—Sir Christopher Wren—devoted some portion of his time to apiarian pursuits, and left behind him a representation of his model hive, some features of which may be discovered in several of the contributions of the apiarian deposits in the Crystal Palace. Wren's hive, of 1654, consisted of three boxes of octagonal shape, placed one above another, each having a hole in the top of similar shape and size, to which there was a cover turning on a pin; and by means of a piece of wire attached to the cover, the hole was easily closed up when required. Each storey was furnished with a sliding door, to be opened or closed at pleasure. In order that each box might fit closely to that in contiguity, the upper edge all round was shaped in transverse section convexly, while the lower edge was shaped concavely. A window of glass, with outside shutter, was fixed to each box opposite to the doorway: the shutters were fastened with locks for security in the absence of the bee-keeper, the windows enabling him, when required, to take a view of the interior; a lining of rush mat within completed the arrangement. From all we have been able to discover on the subject, Sir Christopher Wren's hive was the first in which doors and windows and other architectural arrangements were provided, as before his time the only hives known were those made either of reeds or straw. Sir Charles Whitworth, who took considerable interest in the proceedings of the Society of Arts, presented to that useful body an improved hive, the invention of the Rev. John Thorley, of Oxford, which, until within the last few years, was to be seen in the Society's model room. Mr. Thorley appears to have taken Sir Christopher Wren's hive as his model, for he adopted the octagonal shape, and in the top provided an aperture, with a slide, to admit the bees to an upper box or storey; but, instead of this being of wood, Mr. Thorley introduced a straw hive, also having an opening in its roof, and above it he placed a third storey of glass, which was covered over with a straw case, to be lifted off at pleasure. The great feature in Mr. Thorley's arrangement is the glass at the top, which, when filled with honey, is easily removed by placing between it and the storey below a thin plate of tin, or, in these days, zinc, in order to shut off the bees from below; then, by carrying it to some little distance from the apiary, the bees within it will return to their home, and commence fresh labours in another glass substituted for that taken away, while the bee master or his assistant removes the honied treasure from within the glass. Now, although it is more than three-quarters of a century since the appearance of Mr. Thorley's hive, we find the glasses introduced in almost all the bee-hives, boxes, houses, mansions, or castles, which are scattered about in various parts of the Building. From the great want of classification of subjects in the Building, and the very unfortunate arrangement of the Official Catalogue, we had much difficulty in finding the various contributions connected with this winning subject.

The cruel practice of destroying bees attracted the attention of Thompson, who, in his "Autumn," thus describes the useless custom:—

> Sudden the dark oppressive steam ascends;
> And, used to milder scents, the tender race
> By thousands tumble from their honied domes
> Convolved and agonizing in the dust.

And the Society of Arts, two years after the appearance of Mr Thorley's

FONTAINE À THÉ.—BY DURAND.

hive, endeavoured to discourage as far as possible the cruel practice of destroying bees, by offering the sum of £200 to be divided among those bee-keepers who, within the year 1767, should each collect from his own stock of bees, "ten pounds of clear merchantable wax without destroying the bees, leaving a sufficient quantity of honey for their winter sustenance; £6 being the premium to be given to each, unless there were more than 40 candidates, and then the £200 was to be divided among them equally.

At the beginning of the present century, Mr. Espinasse, a name well known in the legal world, commenced bee-keeping on a large scale; and, as he resided at Bexley, within two miles and a half of the heath of that name, and within one mile of Dartford Heath, the situation was admirably adapted for an apiary, as bees delight in the blossoms of the heath furze, and wild thyme, which afford them an abundance of pabulum. Mr. Espinasse continued to keep bees for eighteen years, and was altogether so successful, that at the end of that period his excellent management was rewarded by the "Silver Ceres" medal of the Society of Arts. His bee-house is worthy of notice, on account of the position of the sliding doors at back, by which arrangement the hives may be examined without disturbing the little labourers when entering or leaving the hives by the doorways in front. A model of an apiary building on this plan is exhibited by Mr. Neighbour in the North Transept Gallery, to which we shall hereafter allude.

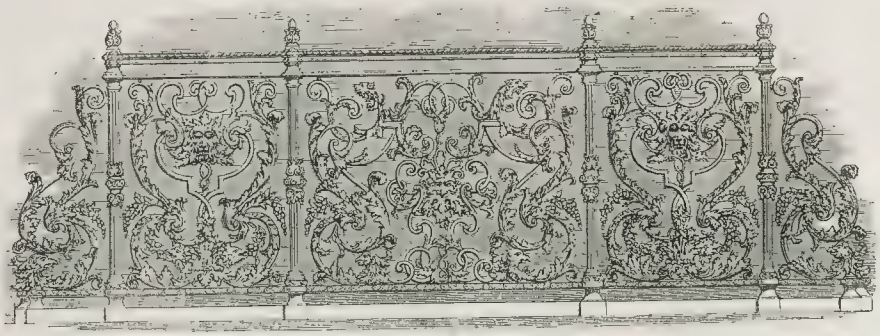
Many years ago, we remember to have visited Wildman's apiarian establishment, in Middle-row, Holborn; he was in the habit of using the bell glasses, placed on perforated boards, similar to the plan of the Rev. Mr. Thorley; and in 1836, Mr. Milton, who exhibits the "Mansion of Industry" mentioned at the commencement of this notice, received the "Silver Ceres" medal of the Society of Arts for his straw hive with revolving top, which may also be seen in the North Transept Gallery. In May, 1844, during the secretaryship of Mr. F. Whishaw, there was a complete exposition of bees, hives, and honey at the Society of Arts, the principal contributors to which were Mr. Milton, Mr. Neighbour, and Mr. Sholl; and the two former of these apiarians, and a son of the third-named, are, in fact, the chief exhibitors in this important branch of rural economy at the World's Great Industrial Show. In parts of the spring and summer of 1843, a hive, or rather a castle of bees, somewhat similar to those in use at the Royal Farm, Windsor, was located in the balcony of the house of the Society of Arts, and afforded a fitting example of untiring toil and industry to the younger members of that valuable institution, which was threatened with entire destruction at the latter end of 1842, but which, by expositions and illustrations of all the most important subjects of the day, attracted hundreds of new members, and consequently led the way to the Great Gathering of Nations in 1851.

The apiarian contributions are to be found in the North Transept Gallery, close to the crystal "wall;" in all parts of the British Agriculture Department; in the South Gallery, among "Substances used as Food;" in the United States Division, close to the eastern "wooden wall," and behind the United States office; and in the compartments of India, the Cape of Good Hope, Canada, British Guiana, Van Diemen's Land, France, Greece, Portugal, Spain, Switzerland, Tunis, Turkey, and Egypt.

(To be continued.)

FRONTISPIECE.—BY CRUCHET.

BEE-HIVES BY NEIGHBOUR AND SON.



CAST-IRON ORNAMENT BY BAILY AND SONS.

FONTAINE À THÉ.—BY DURAND.

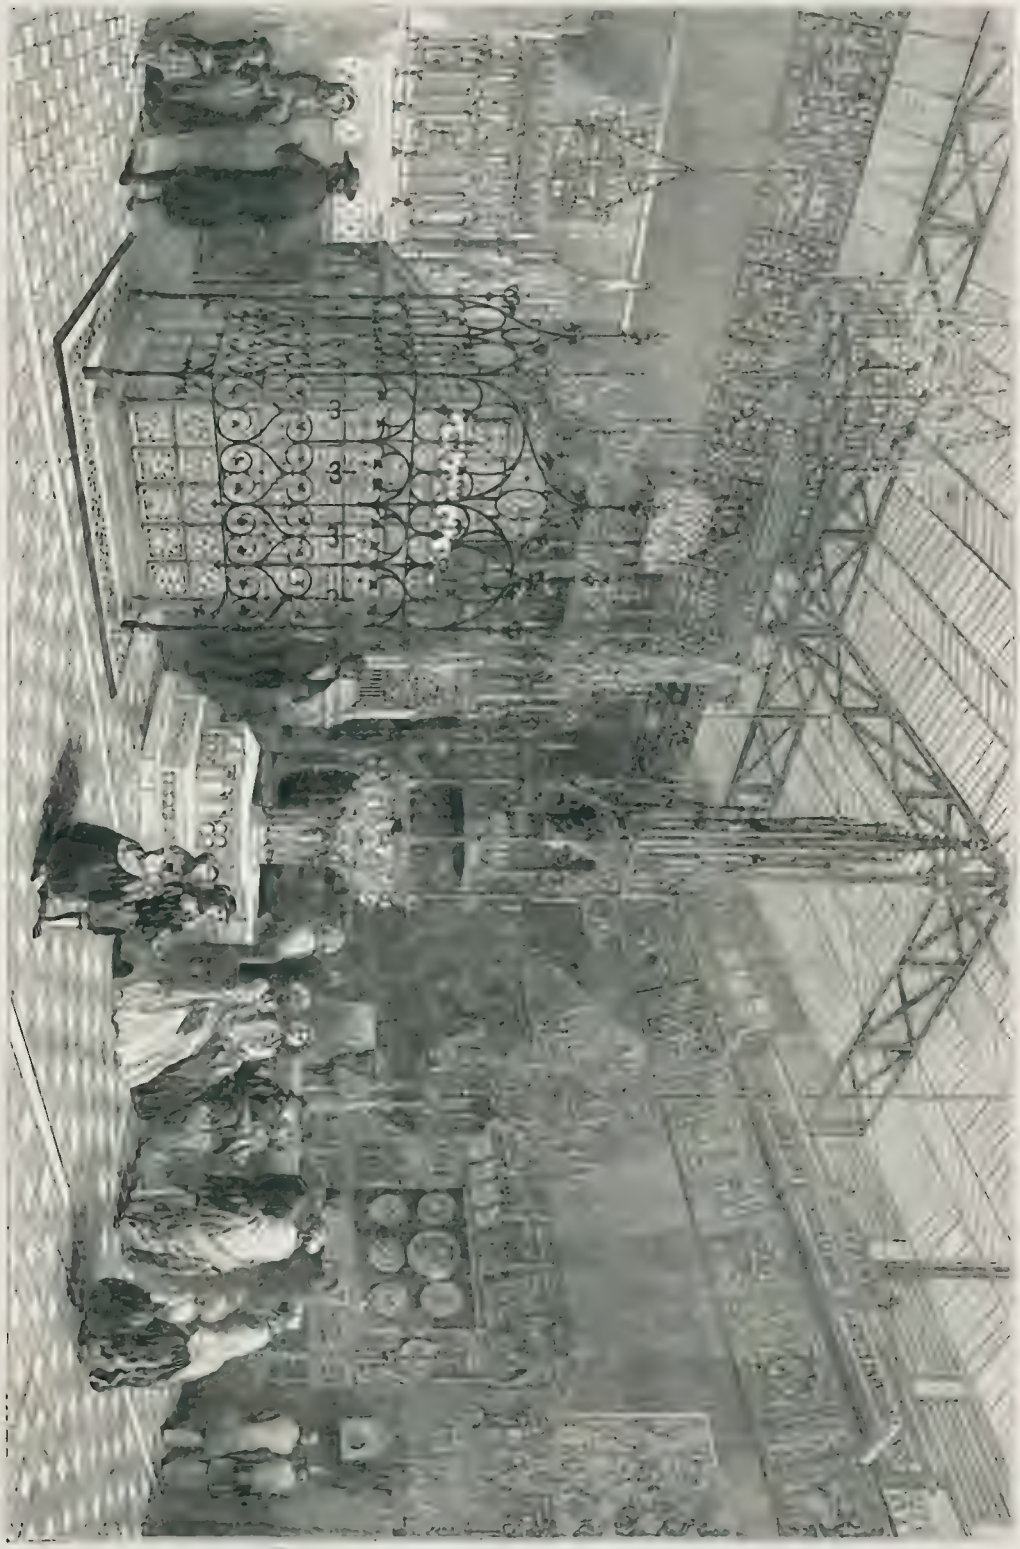
This is a very magnificent production—quite a work of fine art—in as a centre-piece for the tea or breakfast table. It is made of silver, i oxidized, with enamelling, incrustations, &c. It consists of a stand elegant design, supporting a tea-urn with four spouts; and correspo with them, upon silver plates, are four tea-pots, and an equal num sugar-basins and cream-jugs. Around the base are places for sixt twenty cups. The workmanship throughout is of the most elabora costly description.

FRONTISPIECE. BY CRUCHET.

This mixture of joiner's work and *carton pierre* is one of the hal really superb pieces of decorative furniture in the French division. N but the bad taste of leaving the horns of the animals in a natural can be objected to it; and although, in the representation here giv lower half may seem badly proportioned, it is only just to observe, th seems to be a very careful preparation of the designer to obviate the eff stove or table placed before it.

CAST-IRON ORNAMENT. BY BAILY AND SONS.

It is understood that a first-class medal will be awarded to this w which the merit consists, not only in good design, but in the *casting* foliage, which appears intended to revive and imitate that beautiful old *wrought* iron of 1700, which is so much admired by travellers in the Low Countries, and Southern Germany. In looking over the nu amples of ornamental iron castings, we have not observed any atte such very full relief (technically, undercut work), it being genera practice to construct the design in such a manner as to allow the pat be readily lifted from the mould; a practice which can never give t effect produced in this instance, each individual leaf being in itself borate casting, and both sides of the work being equally ornamental.



THE CRYSTAL PALACE.—THE MEDIÆVAL COURT.—(SEE NEXT PAGE.)

THE MEDIÆVAL COURT.

AMONGST all the admirably-arranged treasures of the Great Exhibition, the Mediæval Court, we may say, on mature reflection, presents the most, unique and best harmonised display of art and skill -art in the artist, and skill in the executant. The master-mind who suggested these forms and these colours has evidently supervised their development; each ornament and each detail bears the same evidence, that the head which thought them directed the hands which wrought them. To Mr. Pugin, then, who furnished the design for this gorgeous combination, is the highest honour due; and he has marvellously fulfilled his own intention of demonstrating the applicability of Mediæval art in all its richness and variety to the uses of the present day.

STOVE.

On the north side of the court is a large square stove of remarkable character; it is composed of glazed tiles in relief, of various colours, of which a considerable number are pierced to permit the exit of the hot air. These are fixed in an iron frame, with angle shafts terminating in coronals, and small vanes of gilt metal painted with heraldic bearings. The whole is enclosed with a wrought-iron grille of ingenious construction, all the enrichments being produced by hand, after the manner of the ancient Flemish smiths, and not cast. The crockets and finials are all bent up and twisted out of thin metal, and the general effect is most striking and picturesque, reminding the spectator of the ancient stoves yet remaining in the castle at Nuremberg, and converting what is generally an unsightly object into a highly decorative adjunct to an entrance-hall or gallery.

OAK NICHE

Immediately over the south-east door is a wooden niche, containing a finely carved image of St. John the Baptist: the group peculiarity of this niche consists in its being designed after the old principle, to suit the material in which it has been executed. All the enrichments are sunk out of the thickness of the stuff, there is neither mitering nor lateral projection: the cross pieces are terminated and keyed with wedges, which effectually hold the work together without glue; the canopy is also carved out of three pieces, with sunk enrichments, and crocketed with continuous foliage.

GREAT ROOD.

In the south-east angle stands the Great Rood, intended for the loft of St. Edmund's College, near Ware. The whole is richly crocketed and foliated. At the four extremities are emblems of the Evangelists, surrounded by rich foliage-work, and on the reverse the Four Doctors. Attached to the lower portion of the framing are two pedestals for the images of the Blessed Virgin and St. John. The intermediate panels are filled with rich perforated tracing; and when the whole is arranged in its position, metal branches for lights will be affixed to the stancheons.

STONE-CARVING.—ALTAR AND REREDOS. EAST SIDE.

This altar is intended for the Lady Chapel of a country church. The subject is that of the Annunciation. The whole reredos is divided into five compartments. The two outer ones contain images of the Blessed Virgin and the angel Gabriel; and in the centre the pot of lilies, most delicately relieved in the carving, and interwoven with a label inscribed with angelic salutation. The whole is surmounted by a very rich bratishing of quatrefoils and crocketed work.

THE NICHE

Adjoining the reredos is a niche, surmounted by a rich and lofty stone canopy, for the same chapel. This niche contains an image of the Blessed Virgin holding our Lord in her arms. The dignity of the Divinity is expressed in the countenance of the infant, and in his hand he bears the orb and cross. The Blessed Virgin is attired in a long tunic, and a mantle, with an enriched border, gathered gracefully into long folds: a silver parcel gilt crown, enriched with stones, is placed on the head. The image rests on a high pedestal, with highly relieved foliage, and the angle pinnacles of the canopy rest on two angle corbels issuing from the sides.

TABERNACLE.

Immediately opposite the high altar is a stone tabernacle intended for the reservation of the holy sacrament. It is quadrangular in plan, with four crocketed gablets, three of which are filled with rich tracery, and the fourth is the door, which will, when completed, be made of perforated brass. From the four angles rise buttresses and pinnacles, terminated by angels with musical instruments. From this point the canopy becomes octagonal, and is connected to the square base by crocketed flying buttresses. It is raised some feet, to leave space for the monstrance at Exposition, and terminates by a cluster of pinnacles, and niches filled with angels, of most elaborate design and exquisite workmanship. Its entire height is upwards of 20 feet.

STONE CARVING — WEST SIDE.—TOMB OF THE LATE RIGHT REV. DR. WALSH.

This monument, intended to be erected in St. Chad's Cathedral, Birmingham, in memory of its late venerable Bishop, is designed in the Third Pointed or Decorated style, and executed in a very perfect manner. The effigy is recumbent, the head supported by two angels; it is attired in full episcopal vestment of the ancient graceful form, and the pastoral staff is borne in the right hand. The minutest details of the embroidery are most carefully carved in the stone, and the whole is a *fac simile* of the actual vestments used by the deceased prelate. The effigy has a striking resemblance to those venerable and dignified effigies still remaining in our ancient churches. A richly crocketed canopy surmounts the recess, flanked by two buttresses and pinnacles; the back of the recess is dispered, and the centre, within a quatrefoil, is a bas-relief, representing the Bishop kneeling, and offering the church of which he was the founder.

The base of the tomb contains five quatrefoils, floriated and studded with wall-flowers, with enamelled shields of family and ecclesiastical bearings; and along the upper edge is the following inscription, engraved in brass:—

Orate pro anima illustrissimi Reverendissimi Dom. Thomæ Walsh, Ep. Cambysop., in diet. ecclesiis par. inse 39. Vic. Ap., et hujus ecclesiæ Cathedralis fundatoris. Obit. Vic. ap. Londinen. xvii Feb., MDCCCXLIX.

HIGH ALTAR.

The centre of the east side is occupied by a stone altar, intended for the chancel of a parish church; the front is supported by four marble pillars, with sculptured caps. These stand some distance in advance of the block part of the altar, which contains three deeply-mounted quatrefoils, surrounded by wall-flowers, with three subjects in bas-relief—the "Agony in the Garden," "Our Lord bearing the Cross," and the "Crucifixion:" these groups are sculptured with great severity and truth, and possess a most devotional character. The space between the marble pillars and these sculptures will eventually contain reliquaries like small shrines.

CHIMNEY-PIECE.

On the west side of the court is a richly-carved fire-place, worked in Caen stone; it is intended for the mansion of F. Barchard, Esq. The whole of the ornaments are heraldic, and the crockets are formed by birds encircled with foliage. The centre panel contains the Barchard arms, and the initials of the family fill the lateral quatrefoils. The recess for the grate is lined with tiles, enarged with the crest and initials F. B. alternately. The grate is solidly formed of wrought iron, standing on two dogs of the same material, surmounted by brass birds, and enriched with metal badges of beaten work; a stone fender encloses the hearth, which is composed of red and yellow tiles.

The whole of the stone-work in this court was executed by Mr. Myers, of Belvidere-road, Lambeth, London, inventor of the machine for cutting Gothic tracery and mouldings: specimens of the work executed by it are deposited in the court, close to the bishop's tomb.

There is a smaller fire-place at the north-east angle, also executed in Caen stone: it is square-headed, the hollows of the mouldings are filled with running foliage; the upper part is divided by beads into three panels, filled with Minton's tiles, chastely and elaborately painted with floral and geometrical patterns. The sides of the fire-place are lined by high tiles of a rich and original pattern, and the hearth is encircled by a stone fender; the whole fire-place has a rich and pleasing effect, produced by the combination of carved stone and the enamel painting of the tile-work. There is a small but appropriate grate, supported on dogs, in the fire-place.

THE FONT.

In the centre of the court is a font and cover raised on octagonal steps, the risers of which are enriched with tracery. The bowl is also octagonal, four sides being carved with the following subjects from sacred history —"The Fall of Man," "St. John Preaching in the Wilderness," "The Baptism of Our Lord," and the "Crucifixion." From the four other sides are projecting images of angels, which act as corbels to support the four principal shafts of the canopy. Round the pedestal are images of the Evangelists, the "Blessed Virgin," "St. John the Baptist," "St. Peter," and "St. Paul."

The canopy, which is entirely of oak, and supported by the angle shafts, is raised up to a considerable height, by a succession of pinnacles and tabernacle-work, and is sufficiently lofty to receive the cover of the font, consisting of an octagonal top surmounted by open tray panels, the whole of which rises up into the canopy by the action of counterweight when the font is used, and when lifted to its proper elevation forms a ceiling with the Holy Dove in the centre. This principle of uncovering the font is a considerable improvement on the old method of opening a compartment of the high covers, and is at once more and convenient.

PAINTED GLASS.

The north side of the court is filled with painted glass; and, although the situation is unfavourable for displaying the richness of effect, yet a very tolerable idea of the designs and colours may be obtained from about nine till one on a fine morning, when the southern sun strikes upon them. Over the entrance door is a portion of the south window of the new dining-hall at Alton Towers. The centre light contains an effigy of the Grand Talbot, faithfully delineated from his tomb at Whitechurch. On either side are shields with his various quarterings, supported by Talbots, and intersected with foliage and branch-work on a quarry guard surrounded by a neat border of T's and coronels.

There are two long lights of the Decorated period, with compound niches and canopies, each containing an image: one of St. Thomas the Apostle, the other St. Thomas the Martyr, in rich costume on diapered grounds. These are intended for the court windows of the chantry chapel of the late Bishop Griffiths, in the Collegiate Church of St. Edmunds, near Ware. Over the lower doorway are placed three lights, representing two groups from the life of St. Andrew, and an effigy of the saint, all under very elaborate canopies. This glass is designed in the style of the fifteenth century, as it is to be fixed in a parochial church of that period. Adjoining the centre pillar are two lights, forming the centre light for the great court window of The same church: the subjects represented are the Transfiguration and Crucifixion of our Lord. At the east and are four lights of grisaille work, each containing two quatrefoils filled with subjects from the life of the Blessed Virgin. The groups are relieved on rich blue glass, dispersed, and the grisaille is intersected with ruby and yellow bands, &c., upon floriated centres of varied colours, and each light is surrounded by a varied border. These windows are to be placed on the south side of the Lady Chapel of St. Augustine's Church, at Ramsgate. At the opposite end is another window of two lights, containing niches and canopies, with images of St. Ethelbert of Kent and his Queen, the blessed Bertha. The richness of the habits of the two principal figures is well relieved by a white ground; and this style of glass, treated on the old principles, has all the advantages of producing a rich effect, without impeding the sufficiency of light from entering the edifice. This window is also for St. Augustine's, Ramsgate, and is presented to that church by J. Herbert, Esq., the celebrated painter and academician.

There is a very translucent image of the Blessed Virgin, in a blue mantle, of a rich but subdued colour, precisely similar to that so frequently seen in the old windows, and which is most difficult to attain. A decorated canopy surmounts the light, and the groundwork is a white diaper. The whole of the glass has been painted in the old manner, and without any attempt at antiquity, but left precisely in the same state as that of the old glass when originally executed. In all the designs a due proportion of white has been introduced, without which it is impossible to attain a brilliant effect.

FURNITURE.

The centre of the south side is occupied by a carved oak sideboard of massive construction: the back is raised in panel-work to the height of several feet, and supports an overhanging canopy richly carved and divided into arched panels by moulded ribs; these panels are dispersed in colour on a gold ground. The centre compartment of the back is hung with scarlet cloth, and serves as a background to several large ornamental dishes, parcel gilt, beat up and raised into heraldic devices and bearings, with rich and varied borders, containing crests and motices, all referring to the house of Talbot, as they are intended for the new dining-hall at Alton Towers, now erecting by the Earl of Shrewsbury. The constructive framing of this sideboard is richly ornamented by carving of vine and hop foliage, boldly executed. The two extremities also are carried up in an octagonal form, and terminated by two clusters of foliated brass branches, supporting lights. The doors of the side recesses are elaborately carved and fitted with pierced ornamental hinges and lock plates, in the style of those so skilfully made in the fifteenth century. The sideboard is the production of Mr. Crace, of Wigmore-street. The dishes were executed by Mr. Hardman, of Birmingham.

Immediately in front of the sideboard is a large octagonal table, executed in walnut-tree. The frame and stand is designed on the strongest constructional principles, and its enrichments are only adjuncts to the necessary framing. The top is elaborately inlaid with woods of various colours, and fully proves the applicability of mediæval designs and decorations to every want of the present age. The general effect has all the richness of marquetrie, with purer forms, and a more pleasing combination of colours.

The next most striking piece of furniture is a long book-case or cabinet. The centre doors are filled with open-wrought brass-work of intricate foliated design, and are intended to admit a view of rarely objects preserved in this compartment; the two side-doors are panelled with rich flamboyant tracery. The spaces are divided by carved and moulded muntons; and the whole is surmounted by an elaborate foliated bratishing in oak, interspersed with vanes of brass. The doors, locks, fastenings, and hinges are of brass, and perfectly carved out in character with piercing and chasing.

Adjoining the cabinet is a praying desk, mounted by a triptych, intended for a bookbinder or private oratory. On either side of the desk are carved corbels, supporting a pair of gilt candlesticks, ornamented with fleurs-de-lis, and the monagram M.R. The panels of the triptych, when open, display two miniature paintings of St. Katherine and St. Margaret, and the centre recess is richly dispersed in gold and colours. This piece of furniture has been executed by Mr. Crace, for C. R. Scott Murray, Esq., of Danesfield.

On this side of the court are several pieces of furniture, such as tables, some inlaid at top; chairs, with gilt supporters and velvet coverings; others, more simple in form, of oak, and covered with leather, but as commodious in shape as those of ordinary modern use.

In the centre is a cheval screen, consisting of a richly carved frame, decorated with the rose, shamrock, and thistle, supported by the lion and unicorn at either end, with the Royal arms. The whole is filled with elaborate needlework, executed by a number of ladies, whose names are inscribed in scroll-work on the reverse.

At either end of this side are a piano, the cases of which have been designed in the same style as the rest of the furniture. A piano is so modern an invention, that it has hitherto been considered almost hopeless to combine its construction with old details suitable for the rooms of an ancient mansion; but the present examples fully show that mediæval detail and design is perfectly applicable to all the requirements and inventions of the day. One of these instruments is executed in oak, and is of simple character; the other is most elaborately carved and gilt, the fall painted with flowing borders, and the keys inlaid. The pianos were made by Messrs. Kemble, of Cornmarket-street.

Interspersed with this furniture are a variety of brass candlesticks, sconces, and branches for lights, either standing or projecting from the wall. They are light in design, and well adapted for their purposes, yet most original in form and effect.

It is also most satisfactory to have a revival of the ancient stuffs for hangings. There are a great variety of elaborate and most effective old patterns, executed by Mr. Crace, some in tapestry, others in silk and woollen stuffs, which, by their design, perfectly real those gorgeous backcloths so often mentioned in the pages of the old historians, and depicted in the works of the ancient painters. There are also several carpets of the same character, full of rich colour and design, and without any attempt at false relief and shadow. Over the stone fire-place is a large carpet pine-apple and gilt pattern, and much greater variety could have been exhibited by Mr. Crace, if the wall space had not been so limited.

On the same side as Mr. Crace's furniture is an oak cabinet of very elaborate design: it was executed by Mr. Meyers, as a present to his son, and the enrichments of the panels contain the various tools used in masonry, ornamentally disposed with foliage. All the details of this cabinet are executed with great delicacy and skill, especially the open panels of the upper part: the hinges, escutcheons, locks, &c., are of wrought brass, and highly ornamented.

In the south-east angle, adjoining the Great Rood, is the first portion of an oak staircase for the same mansion as the stone fireplace. The whole design is of the most solid description. The newels are worked out of square logs of wainscot, all the carving and enrichment being kept within and sunk from the faces. They are tenanted by birds holding labels for inscriptions, all worked out of the solid. A deeply moulded handrail runs between the newels, beneath which are a succession of open-work panels corresponding to the number of steps. These panels, which are very boldly carved, contain birds with reference to the family crest, initials interspersed with foliage, and the motto, "In Deo confido." This motto is also introduced in the string-board of the staircase with oak-leaves intersecting. Although this is only a small portion of the staircase, it will enable the spectator to form a tolerable idea of the rich effect of the whole when completed.

In the opposite angle is one compartment of large oak screens for the Pugin Chantry, St. Augustin's Church, Ramsgate. In design it greatly resembles some of those elaborate oak screens yet remaining in the Norfolk churches. It is strictly wooden in its design and construction: each division projects like a buttress with open tracery above, foliated carved work beneath; and to the shaft of every pinnacle is a brass branch, intended for tapers on the celebration of anniversaries. This screen, as well as the staircase, has been executed by Mr. Meyers, and the tracery work is produced by his new machine, which cuts any circular form with great expedition and perfect accuracy.

CHURCH ORNAMENTS, METAL-WORK, &c.

A very large portion of the contents of the Mediæval Court comes under this head. Immediately in front of the great sideboard hangs a chandelier of striking appearance and considerable dimensions. It is constructed on the octagonal principle, and is composed of a number of shafts terminating in pinnacles passing through frames of pierced-work fixed to a central shaft of united brass. From each pinnacle springs a succession of light foliated branches, the stems of which terminate in coronals and sockets supporting the candles. Shields charged with the Talbot lion are interspersed among the branches, and by the colour heighten the general richness of effect. The first idea of this chandelier is taken from the celebrated one at Nuremberg; but it is larger in dimensions, and much lighter and stronger in construction. It is to be suspended in the centre of the new dining-hall at Alton Towers.

Immediately opposite is a large brass cornice of an early style, intended for a church of Byzantine character. It is composed of segments of circles filled in by rich intersecting open-work, and supporting a deep rim and bratishing. To these are attached the standards which carry the tapers, and are composed of coronals, with crystal knobs and small coronals. The weight of the lower crown is partly carried by chains of a very ornamental character fastened to an upper crown, and the effect of the whole is extremely rich and striking

Round the high altar on the east side, a set of six brass pillars, about 12 feet in height are erected. These pillars are highly ornamented: their shafts, with moulded caps and bases, and sustain six angels, also of brass, with outspread wings, bearing standards with tapers between every pillar is a brass rod with open-work bratishing, and rings from which silk curtains drawn with sacred emblems are suspended. This kind of inclosure was formerly to be found in the majority of the foreign cathedrals, and occasionally in our own; but bad taste and revolutionary violence have completely stripped the ancient churches of these beautiful arrangements, and they have been revived for the first time for the chancel of St. Thomas's church at Erdington, for which the whole of this work has been designed and executed.

In front of the high altar hangs a carved beam, similar to those described as having been suspended in Canterbury Cathedral and other churches. It is intended for chapels dedicated to the reservation of the holy sacrament. At the centre and extremities are quatrefoils filled with foliage, and on these the iron-work, by which the whole is suspended, is attached. Along the upper edge is an open cresting of brass-work, supporting bowls and prickets for tapers. To the lower side of the beam are suspended seven silver lamps of the ancient form, several of which are enriched with enamels. The wick burns in a ruby glass dropped in a silver bollar hung from delicate chains attached to the larger ones which sustain the chased basons hanging beneath to receive any drippings of oil. These are designed on the real principles of church lamps, and according to the most ancient customs, and they are perfectly consistent in form, and convenient for their purposes, while modern church lamps are usually made like huge bowls full of emptiness, with glass stuck in the top of them. The beam, and its appurtenances, are a most satisfactory revival of one of the most beautiful ornaments that formerly decorated the ancient churches.

Round the high altar are placed several high-standing candlesticks terminating in branches and coronals for lights, intended for the elevation or benediction. There are also six silver candlesticks on the altar of twisted and chased-work, rising from octagonal bases, ornamented with crystal knobs and knops. This design is particularly well adapted to the metal, as they produce an infinite variety of bright and reflected lights.

There are a great number of lamps and corona suspended round the court, for the domestic and ecclesiastical uses: they are all designed on the same principles of lightness, combined with a rich and flowing outline of candle-branch. The outline of many of them is most pleasing, and will recal similar objects depicted in the interiors painted by John of Bruges and other early masters.

The arms painted in the panels of the cone which surrounds the upper part of the court are those of some of the patrons and artists who have contributed to the revival of mediæval taste and principles

On the eastern side of the court are two glass cases filled with silver work and jewellery: that on the north side is devoted to ecclesiastical ornaments, and the opposite one is filled with secular plate, jewels, &c. In the former there are several richly enamelled chalices of the ancient form, with chased perforated knops of intricate design and hexagonal feet most richly chased and decorated with enamel and precious stones. There are two monstrances of elegant design, but of very different character. The first is a circlet of rich tracery, like a crown supported by a hollow stem, and surrounded with enamelled quatrefoils representing cherubim in adoration. The second is like a open spire or canopy of octagonal form springing from four pinnacled shafts, supporting images of angels with scrolls. The execution of this, even to the minutest details, as the crockets and pinnacles, will bear comparison with some of the best works of the thirteenth century, and may be considered a great advance in the revival of this art. On one side of the same case is a pastoral staff for a bishop, enamelled, crocketed, and containing several images in the crook under canopied-work. This case also contains some richly enamelled candlesticks, crosses, bindings for missals, and a variety of church ornaments most elaborate in detail.

The opposite case, devoted to secular plate, contains a variety of specimens of candlesticks, salt-cellars, dessert services, flagons, &c., of simple form, but designing which much feeling is discernible in the productions of the ancient silversmiths. The effect is produced by beating-up and engraving. There are no cast ornaments or heavy foliage, but the nature of the material is well-considered in the designs, and produces a great effect in proportion to a comparatively small cost.

There are several trays of jewels, the setting of which is according to the old Venetian manner, the stones being almost detached, and held at points, by which a transparent effect is obtained. The specimens consist of crosses, bracelets, necklaces, brooches, rings, and a girdle. The cast made to contain them is exceedingly elaborate, and of elegant design, with enamelled lock and heraldic devices.

On the opposite side of the court are two other cases containing church vestments, made after the ancient form, which has been recently revived in England, in lieu of the long modern stiff and buckramed *chasuble* of France. The laces which form the orphreys are adapted from ancient examples, and a great variety of these are exhibited on both sides of the cases. There is also an albe with the ancient apparel on the hands and ecclesiastics on tombs and sepulchral brasses, and two copes, one of which is of white cloth of gold. There are also a variety of stoles, maniples, chalice-veils, in the same case.

On either side of the high altar are ranged several interesting objects in brass. There is a large brass of a lofty paschal candlestick for the solemnity of Easter. The base is triangular for three pedestals, on each of which is an image of an angel pointing upwards and announcing the glad tidings—"He is risen." The shaft rises in an hexagonal form, and from the alternate sides issue three cupels, and niches with canopies; under these are placed images of the three Marys, holding vessels of ointment. Continuing still higher, the stem, which is much enriched, terminates in a cap composed of three projecting niches with angels bearing scrolls, inscribed "Alleluia," and a foliage coronal surrounded with a bratishing, from the centre of which rises the candle, the stems of which are beautifully painted with devices and inscriptions after the ancient manner. The beautiful principle of illuminating the lower portions of altar candles with colour and gilding has been carried out in the tapers for the altars as well as the paschal.

Adjoining this candlestick, are three lecterns. The first is design

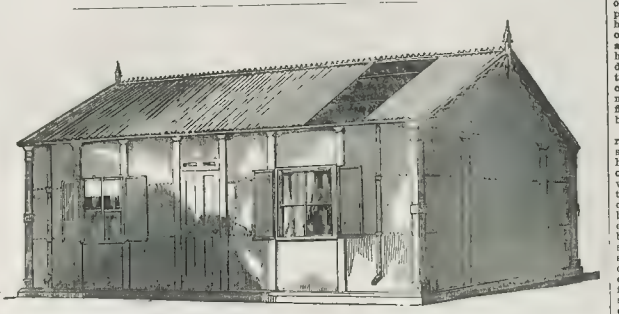
with two branches separating from a solid stem (the base), and supporting two kneeling angels, who carry a perforated tracery panel to receive the book. The second is a large eagle with outspread wings resting on an orb supported by an hexagonal pedestal of open tracery-work, from whence spring three flying buttresses resting on pinnacled shafts, surmounted by half images of angels bearing scrolls. The base is very massive, and rests on three lions couchant. Two large foliated branches are attached to the shafts, and carry tapers to afford light to the *lector*; these branches are moveable, and may be adjusted at pleasure. This noble lectern was presented to St. George's Church, Southwark, by the Rev. D. Haigh, of Erdington.

The third lectern has been designed from an ancient example at the Cathedral at Courtrais. The desk is perforated with a device of the holy name spread out into flamboyant tracery; the shaft is terminated by an image of St. John the Evangelist.

Opposite these, and in front of the niche, is placed an iron candlestick of wrought-work, which turns on a centre and is intended to receive offerings of tapers for the Lady Chapel of St. Augustins Church. This is a most elaborate piece of iron-work, worthy of the ancient smiths, and is a striking proof that our operations, when under proper directions, are quite capable of representing the most beautiful works of mediæval skill. Near this is a credence table of wrought brass, with a marble inlaid top, and many other objects connected with church decoration, all from the workshops of Mr. J. Hardman, of Birmingham.

CAST-IRON HOUSE BY BELLHOUSE AND CO.

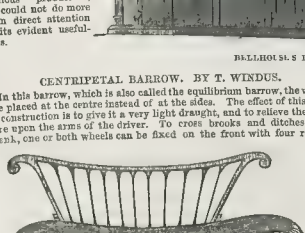
The commission with which Messrs. Bellhouse, of Manchester, have been honoured, and which they have already executed, of erecting a cast-iron ball-room attached to the Royal residence at Balmoral, was the consequence of Prince Albert's inspection of the model cast-iron house, intended for the use of emigrants, exhibited by the same firm in the Crystal Palace. In Engraving a representation of this ingenious production, we could not do more than direct attention to its evident usefulness.



BELLHOUSE'S IRON HOUSE FOR EMIGRANTS.

CENTRIPETAL BARROW. BY T. WINDUS.

In this barrow, which is also called the equilibrium barrow, the wheels are placed at the centre instead of at the sides. The effect of this mode of construction is to give it a very light draught, and to relieve the pressure upon the arms of the driver. To cross brooks and ditches on a plank, one or both wheels can be fixed on the front with four revolu-



CENTRIPETAL BARROW.

tions. Scrapers are attached to prevent clogging; and it is stated, that, instead of injuring gravel walks, &c., it rather improves them. The wire cradle, which is moveable, can be used as a feeding-rack, or to carry plants and trees from a conservatory, or other like purposes. It is the invention of Mr. T. Windus, of Stamford-hill.

ARMS AND ARMOUR.

(THIRD NOTICE.)

As the musket is the modern substitute for the bow, so we found ourselves leaving the domains of archery to enter upon the historical field of small-arms of fire. We shall now retrace our steps a little, that we may give the history of cannons, which are not only suggested to us by the highly polished great gun of Herr Krupp but also by the numerous serviceable-looking engines of destruction exhibited by our friends the Belgians; and yet a little further must we retire into the history of early times, so that we may offer a sketch of the history of gunpowder; without a slight mention of which our notice of fire-arms would be incomplete.

Whatever peace-makers may say to the contrary, we hold gunpowder to have largely contributed to the world's civilisation; probably, too, it has contributed to the world's peace. At any rate, its discovery and application must be regarded by all as an important event in the history of mankind. That the claim for the honour of discovering so remarkable a substance should be disputed, is not wonderful; accordingly, we find that many rival pretensions have been advanced. Polydore Virgil and Thevet attribute the invention to a monk named Constantine Anclzen, a chemist of some celebrity in his time. Others maintain that it was discovered by Bartholdus Schwartz, in the year 1320. There is not the least difficulty, however, in referring a knowledge of gunpowder to an earlier date than the above, our own countryman, Roger Bacon, having distinctly mentioned it in 1267. He describes its composition, specifies many of its properties, and enumerates its explosive powers as a means of destroying animals. He states that when inflamed it makes a sound like thunder, and a flash like lightning, but exceeding both in sound and brightness. He goes on to speculate on the probability of its employment by Gideon when he defeated the Midianites with three hundred men, as described in the seventh chapter of Judges. We English are in the habit of saying that Bacon "invented" gunpowder, whereas a slight examination of his writings suffices to disprove this notion. So far from laying claim to the discovery of gunpowder, Bacon distinctly mentions it as a substance well known in his time; he even goes on to tell us how to make a cracker.

It is quite clear, then, that the discovery of gunpowder dates further back than the time of Bacon; and M. Dutens, a gentleman who has written a book to prove that the ancients knew many things which are commonly attributed to the moderns, imagines that Bacon must have derived his knowledge from Marcus Græcus, who lived about the end of the eighth century. This author not only had a general knowledge of the properties of gunpowder, but he gives a tolerably precise description of the method of manufacturing it.

Now Bacon mentions saltpetre as having the probably explosive qualities; but saltpetre alone will not even burn, much less explode; hence Bacon must have omitted to mention the other constituents of gunpowder, viz. charcoal and sulphur, on an assumption of their non-importance, for, in another part of his writings, he gives directions for the manufacture of gunpowder. Bacon, our readers should know, was an alchemist, and, like others of his class, he considered it a point of honour to make his description of processes a little cloudy; accordingly, it is not to be expected that he should give us his description of gunpowder all at once. Little by little, however, the information oozes out, as we shall see. In one passage of his work, "De secretis Operibus Artis et Naturæ, et de Nullitate Magiæ," he says, that from saltpetre and *other* ingredients, we are able to make a fire that shall burn at any distance we please. This is his first instalment of information. Presently comes another: "Sed tamen salis petræ *luru nope cum sibre et sulphuris*, et sic facies tonitrum et coruscationem, ut sensu artificium." Here saltpetre and sulphur are indicated, as plainly as we have a right to expect from one who thought a little obscurity was necessary for his dignity sake; but what can *luru nope cum sibre* mean? Why it is no more nor less than a transposition of the letters *carbonum pulvere*, in which myth the crafty old alchemist thought proper to hide his treasure. If, then, Bacon did not discover gunpowder, who did? The answer to this question is not clear, the early history of gunpowder being shrouded in the mists of antiquity. Various documents could be mentioned to prove that gunpowder was known in India at periods of very great antiquity, and collateral testimony exists in favour of its being known also to the Chinese. Citizen Langles, in a memoir read before the French Institute, contends that gunpowder was conveyed to Europe by the Arabs, on the return of the Crusaders, and says that the former people employed it at the siege of Mecca, in 690. The Arabs, he says, derived it from the Indians. Now, at the time when Roger Bacon lived, the Arab portion of Spain was the favoured seat of literature and art; and, as we know he travelled in Spain and was familiar with Arabic, it does not seem improbable that he derived his knowledge of gunpowder from some treatise in one of the Saracen libraries. This supposition, at any rate, is just as probable as that he read the treatise of Marcus Græcus: indeed, there exists at this day, in the Escurial, an Arabic treatise on gunpowder, written in the year 1249.

If we are to believe Philostratus, (who, by the way, had a very bad habit of telling untruths), gunpowder was not only known to the natives of India in the time of Alexander's conquests, but even the application of gunpowder to the purposes of fire-arms. Referring to the Oxydracæ, he says, "Those truly wise men dwell between the Hyphasis and Ganges: that country Alexander never entered, deterred not by fear of the inhabitants, but, as I suppose, by religious motives, for, had he passed the Hyphasis, he might doubtless have made himself master of all the country round them; but their cities he never could have taken, though he had led a thousand such as Ajax to the assault; for they come not out to the field to fight those who attack them; but those holy men, beloved by the gods, overthrow their enemies with tempests and thunderbolts shot from the walls. It is said that the Egyptian Hercules and Bacchus, when they overran India, invaded this people also; and having prepared warlike engines, attempted to conquer them: they in the meantime made no show of resistance, appearing perfectly quiet and secure; but, upon the enemy's near approach, they repulsed with storms of lightning, and thunderbolts hurled upon them from above."

It is true that Philostratus was a story-teller in more senses than one, but, taken in connexion with the fact that pyrotechny has been cultivated in India and China from time immemorial, the narration just quoted is at any rate probable. India is just the place where the accidental discovery of gunpowder *should* have occurred. Nitre is there abundant as an efflorescence on the surface of the ground; and if the nitre by chance had got mixed with charcoal, gunpowder would have resulted. Sulphur improves the compound, it is true; but a tolerably good gunpowder can be made without. Those persons who advocate the opinion of the modern discovery of gunpowder, say that the historical documents in which it is mentioned without ambiguity are of but doubtful authenticity—that the narrative of Philostratus is not only ambiguous in itself, but vitiated by the bad character of the author; that mere poetical allusions are not to be received as authority in scientific matters—nor are they to be literally understood; and, lastly, they argue that if gunpowder and fire-arms had been known in Asia, some of the conquering hordes who removed thence for the purpose of waging war in Europe, would have used such powerful auxiliaries in war. At any rate, Mahomet, it is alleged, should have known about gunpowder and applied it, like Genghis Khan; yet such was not the case.

To these allegations it may be rejoined that the discovery of gunpowder is one question—the application of gunpowder to fire-arms another; that gunpowder probably was originally the result of chance, whereas a great deal of reflection and skill must have been expended on the construction of fire-arms, which, when made, probably were so rude that the bow might be considered the superior weapon, as indeed it is amongst the Chinese of the present day, as it was in England in the reign of Henry VIII., and amongst the Asiatics not two centuries ago.

Thus, notwithstanding our examinations, we find that the first originator of gunpowder is still unknown. It is quite clear that Bacon did not discover it, neither did Schwartz, neither did Marcus Græcus; and our endeavours to arrive at the individual to whom this honour should be attributed have only had the effect of carrying us back into the mystic records of Asia, where, if we are to trust our documents, gunpowder has been known from time immemorial. This much is certain, its first application to artillery in Europe dates from about the beginning of the 4th century.

Having stated thus much about gunpowder, it is time for us to direct our attention to guns: and, first of all, let us take a glance at the cannons in the Exhibition. Conspicuous for these engines amongst all the associated nations are the Belgians, who have sent us from Liége cannons of different weight and bores, all of them demonstrating the high amount of excellence to which our neighbours have arrived in making heavy castings. These Belgian guns, although good specimens, afford very little scope for general remark; indeed, a cannon is so simple a weapon, that very little can be said about its construction or properties. At the present time, cannons are almost invariably made either of cast iron or a sort of brass termed gun-metal; but before the art of casting and boring were brought to their present perfection, cannons were made of bars of wrought iron, confined together with hoops; indeed, in many cases, even this amount of constructive skill was too great for the cannon-maker, who contented himself with using hollow wooden trunks, and, on some occasions, coils of rope. As for wrought iron, the attempt has often been made to weld it into cannons; but, so far as cannons of any size are concerned, the attempt has been invariably unsuccessful, for the reason that our means of welding such large masses of iron are imperfect. Probably our readers will remember the circumstance of a large wrought-iron cannon having burst, some years ago, on board of an American ship of war, the second or third time of firing.

For small cannons wrought iron answers well enough, but the process of manufacture is laborious, and the gun, when made, is not better than one made of brass. In the English service, small cannons, such as field-pieces, are usually made of brass, but larger cannon of iron. In France, however, it is by no means uncommon for battering cannon to be made of the latter material. The advantages of a brass cannon are lightness and strength: the disadvantages, softness of material—causing the touch-hole to enlarge, and the bore of the gun to be corroded; pliability, which destroys the straightness of axis, and causes the muzzle, after a certain time, to droop; and, lastly, a dull, heavy, painful noise on being discharged. In the English service (we cannot answer for that of other nations), the balls intended to be fired out of brass guns are usually fixed in a wooden cup or basket, by which means their contact with the brass barrel is prevented, and their abrading influence is diminished.

Large fire-arms may be divided into cannons, mortars, howitzers, and rockets. Cannons are generally intended for the purpose of projecting solid balls; but, of late years, the practice of employing them for shells has become prevalent. The bore of a cannon is of the same size throughout, but mortars, howitzers, and carronades are *chambered*, or, in other words, are smaller in the part which receives their charge of powder than in the rest of their bore—a contrivance which permits the charge to be ignited more centrally than otherwise would have been possible, and thus enables the powder to explode with increased effect. The chambering of large fire-arms is analogous to the patent breeching of portable guns—a contrivance which we shall speak of presently. The theory of the propulsion of fire-arms missiles is almost too simple for remark; the vast force of these projectiles being dependent on the sudden evolution of an immense volume of gas, generated by the combustion of gunpowder. Long after the discovery of cannons, the flight of their projectiles was involved in the greatest mystery—was considered to follow a different law from that regulating the flight of all other bodies; and anterior to the period of Tartaglia, the Venetian, artillerists universally believed that the first part of the flight of cannon-balls was in an absolutely straight line. The fallacy of this opinion Tartaglia demonstrated by shewing that even from the first instant of discharge fire-arms missiles described a curve; and soon after, Galileo proved this curve to be derived from a parabola. We say *derived* from a parabola, because, contrary to what school books tell us on this point, the curve is only a true parabola in vacuo. If the cannon-balls be fired at slow velocities, the curve does not largely vary from the parabolic form, and the parabolic theory may be applied with advantage as a basis of calculation to the law of their flight; but if they be projected at high velocities, the parabolic theory is useless.

The Belgians give us a sample of their ingenuity in making bomb-shells; the Russians do the same. These terrible projectiles, although very simple to look at, require great delicacy in their manufacture. They must be cast without any flaws, and must possess an equal thickness in every part. To determine the absence of flaws, each bomb-shell is proved by forcing air into it with bellows whilst under water; and equality of thickness is proved by gauging. Shells are nearly filled with gunpowder, into which is driven a fusee, timed to burn a given number of seconds, and to explode the charge within the shell when the latter shall have arrived at the desired mark.

Formerly shells were exclusively shot out of mortars and howitzers, but they are now very generally shot out of long guns. The Shrapnell shell is similar to the bomb shells we have been describing, but much thinner; and, instead of mere gunpowder, it contains a mixture of gunpowder and small iron balls, the former just enough to burst the shell and scatter the balls. The Shrapnell shell is intended for doing execution at distances beyond the range of canister and grape-shot, both of which scatter immediately they leave the gun. The largest sized bomb-shell used in our service has a diameter of thirteen inches; beyond which size they may be made, but the mortars for shooting them would be not only unwieldy, but such heavy castings would be generally imperfect.

Carronades are short, light, large-bored cannons, made to be charged with much smaller quantities of powder than other guns of equal bore, and chiefly designed for the upper decks of ships, where the weight of ordinary large cannons would be a disadvantage.

Congreve rockets are only modifications of the common sky rockets, which, far from having been applied to warlike uses by Sir W. Congreve, for the first time, have been used for that purpose by the Chinese from time immemorial. This fact is testified by Sir William Congreve himself, in his treatise on rocket practice.

And now, having hurried over the department of cannons with something like the velocity of their own missiles, we come to speak of small arms of fire. We cannot devote either time or space to an historical investigation of the subject, but must content ourselves with a general *coup d'œil* of the small fire-arms in the Exhibition. In this department, again, the Belgians are prominently conspicuous, displaying guns and pistols of all kinds, to suit the tastes of various nations—European, African, Asiatic, and American. From the small-bored, long barrelled gun, with short stock, used by the turbulent hordes of north Africa, to the delicacies of breech-loading rifles and revolving pistols, the Belgians have them all; and we would have our military readers mark well this fact, that amid the collection of small fire-arms, including patterns of different nations, the British musket is the worst constructed, most ill devised, and inefficient instrument of all: we would have them mark this too, that the common musket is fast giving way to the rifle, which, by the modern plan of using conical bullets, can hit off a man with comfortable facility at a distance of some 800 yards. These facts are significant. Whilst penning these lines, we are informed, on competent authority, that the present English musket is already condemned at high quarters; and that very speedily all the troops of the line will be armed with the oval-bored rifle, that is to say, a two-grooved rifle in which the grooves are so wide and so deep that the arms of the barrel presents an oval contour. With a weapon of this construction it is said that a man may be hit off at 1000 yards. The English authorities repudiate all breech-loading guns as being liable to get out of order; hence the new guns will be charged at the muzzle, as of old.

But we are anticipating our subject. We have not yet said what a rifle is. A rifle, then, is a gun, the barrel of which, instead of being smooth inside, is cut in furrows running in a screw-like or spiral direction, by the contrivance the bullet cannot roll out as is done from common guns, but assumes in its exit the barrel's spiral twist, and after leaving the gun spins through the air on an axis coincident with its curve of flight, by which means very great precision of aim is acquired. It follows, from a consideration of the rifle gun, that the end of a bullet which first emerges, strikes the object first: in other words, so long as the spinning motion of the bullet continues, the axis of rotation of the bullet does not change. Taking advantage of this principle, rifle bullets may be made of a conical or pyriform shape, by which means a increased weight of metal may be fired from a bore of given diameter: a conical rifle bullet will always strike tip foremost, and if this tip be made of steel, the penetrating effect of the missile becomes terrific, as the reader may satisfy himself by taking a glance at the French department, where we will see the effect of shooting these steel-tipped bullets against a thick plate of wrought iron.

As considerable difficulty is experienced in charging rifle guns by the muzzle, various contrivances have been had recourse to at different times for loading them at the breech; but in the military service of all nations, loading by the muzzle has until lately prevailed. In the Prussian zünd-nadel-gewehr, or needle gun, however, loading by the breech is effected by a very ingenious contrivance; and in the cartridge, on one end of which is stuck a patch of detonating powder, becomes exploded by the rapid darting forward of a needle, whence the appellation *lurn-needle gun* is derived. The patent breeching, of which we spoke when treating of *chambered* artillery, is an invention of the late Mr. Kerr, by means of which the charge of powder becomes ignited *centrally*, not *laterally*; and instead of being a mere screw-plug, as the common breeching apparatus of muskets and low-priced fowling-pieces, consists of a small chamber, which screws on to the butt extremity of the barrel.

The American revolving pistols differ from those commonly seen in England, in the circumstance of their only having one barrel a fixture, the compound breeching being made to revolve; whereas, in the English revolving pistol, the barrels themselves turn on a pivot.

And now, trusting that the reader's experience of fire-arms may never verge disagreeably towards the practical, we make our bow, and conclude the subject.

ELIZABETHAN CEILING.—BY JACKSON AND SONS, OF RATHBONE-PLACE.

CEILING. BY JACKSON AND SONS.

Although rather heavy (and this fault is made more perceptible by the very tasteless colouring bestowed upon the work), this specimen of one period of the Elizabethan style still very creditably shows what can be done with paper in this manufacture.

SECRETAIRE. FROM FLORENCE.

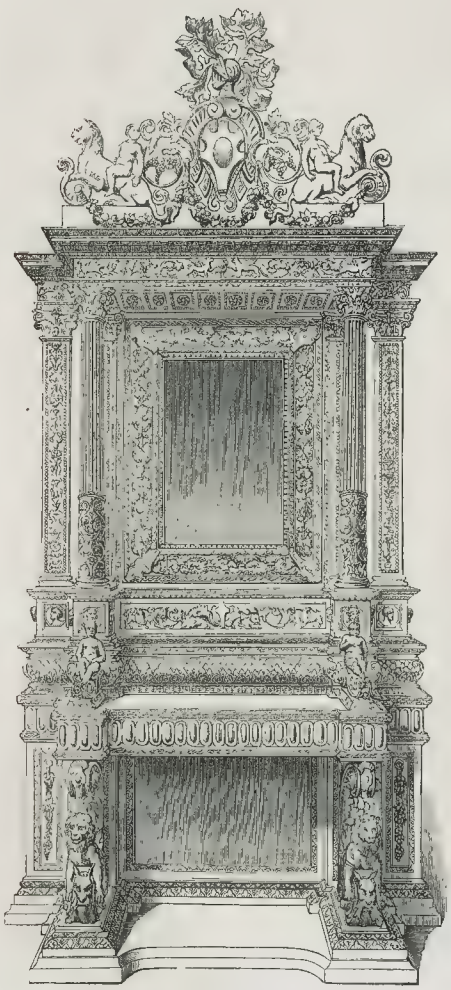
Among all the specimens of furniture in the Building, few will be found to compete successfully with this article, in appropriateness to its purpose, beauty of design, skill in carving, and general high finish. The details are elaborated in a manner which no words adequately convey to the mind.

"ORIGIN OF THE DIMPLE." BY KIRK.

This fanciful subject has been very cleverly treated by Mr. Kirk in the little group of which we give an Engraving.

TEA-TRAY. BY WALTON AND CO.

The sets of trays, by Walton and Co., of Wolverhampton, present specimens of various styles, from the simple and severe Etruscan to the brilliantly coloured mosaic and alhambresque. The *Renaissance* wine-tray is an example of the use of pearl to produce a natural effect, by being introduced as jewels, in conjunction with gold and colours. Something remains to be said of the process of manufacture employed upon these goods. The perfect adhesion of an opaque glass, fused by heat on the surface of wrought iron, so as to produce a smooth and even enamel, capable of withstanding the effects of the atmosphere, and also alternations from heat to cold, has long been considered a great desideratum by all manufacturers of hardware; and it has only been after a considerable expenditure of time and capital, that Messrs. Frederick Walton and Co. have been enabled to patent a process for effecting this object. The articles shown are covered with two descriptions of enamel: the one intended for better purposes is of a pure white colour; that upon the commoner goods, as stable-buckets, water-cans, &c., is black, and applied to coat the articles both inside and out, being less expensive. It does not show dirt so easily, and is equally effective and durable. In these works the ornaments are designed by Alfred Finley, the figures painted by Henry Stanier, and the flowers by E. Haseler.



SECRETAIRE, FROM FLORENCE.

"ORIGIN OF THE DIMPLE."—BY KIRK.

TEA-TRAY.—BY WALTON AND CO., OF WOLVERHAMPTON

STATE HOWDAH.—EAST INDIA DEPARTMENT.

This state howdah, or palanquin, which is exhibited by her Majesty, is a specimen of the extreme of oriental luxury. It is made of ivory, carved, and surmounted by a gold-embroidered canopy, with trappings to match, which fall around the sides of the elephant which carries it.

SLATE BATH. BY MAGNUS.

Excepting the blue columns, which will never suggest *lapis lazuli*, the most extravagance of which most persons' fancy is capable is here realised at no enormous cost, with equal success, in the imitation of different marbles, which have been judiciously chosen.

LAST VIEW OF DIVERS FOREIGN EXHIBITORS.

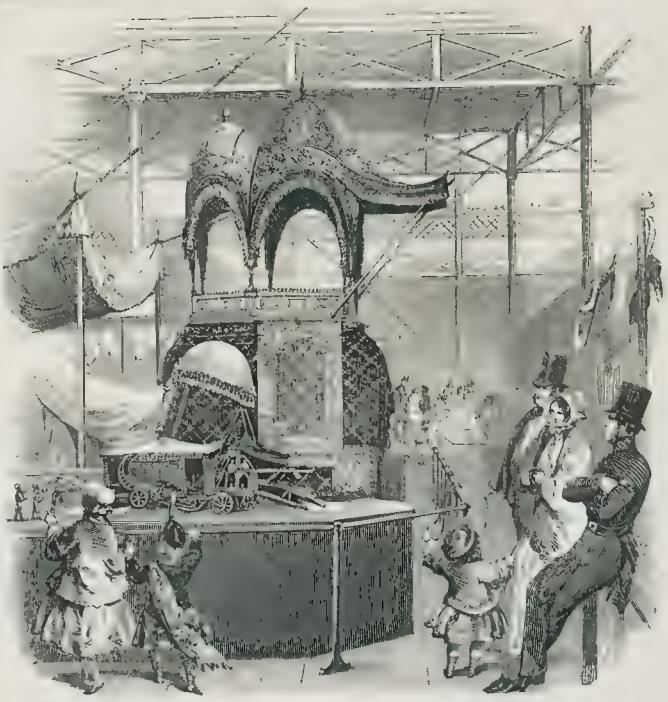
BEFORE bringing to a close the Supplements in which an attempt has been made to describe and illustrate the most remarkable of the specimens of industry and skill exhibited in the Crystal Palace, we desire to mention in turn all the countries which, pressure of other matter, or the smallness of their contributions, or the late period at which they were unpacked, have caused us hitherto to pass by. We must urge on those who consider themselves neglected, that the Crystal Palace contains 18 acres of various productions, and that it would take nearly as many acres of print and pictures to describe them all.

We shall commence by noting the salient "*exhibits*" of the nations and colonies which have not hitherto formed the subject of separate articles, like those devoted to France, Russia, and the United States, and conclude by noting contributions of any importance which have been unpacked within the last few weeks. We begin with

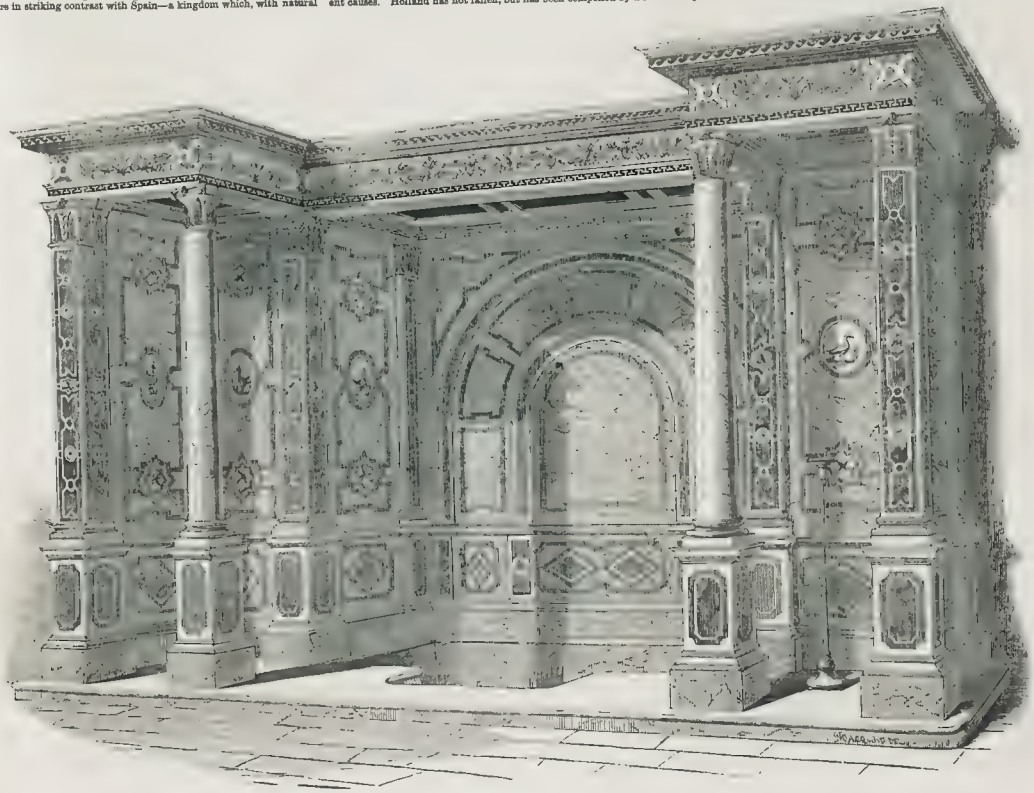
HOLLAND.—The kingdom of the Netherlands, or Holland, as it is more commonly called in this country, occupies a deservedly high place among the commercial nations of Europe a rank due to the probity, industry, and enterprise of its people. Holland has maintained its national credit in the face of misfortunes that would have engulphed a less industrious and frugal country in hopeless bankruptcy. Without mines, with few manufactures, with a limited territory, with only one colony of any importance, with a weight of taxation, as calculated per head, only second to that of Great Britain, in spite of a revolution and a war which deprived her of a territory and population of mines and manufactures, Holland holds a rank, and inspires a degree of confidence and respect which appears in striking contrast with Spain—a kingdom which, with natural resources, second to none in the world, is always on the verge of open national bankruptcy, and has become a by-word for everything that is politically degrading and dishonest. Holland and Spain were both great powers while England was still in the infancy of its commercial career, but they have sunk to the condition of second-rate powers from totally different causes. Holland has not fallen, but has been compelled by a limited territory to stand still while other nations of greater natural resources have marched on, and has been obliged to pay in taxation the penalty of wars and convulsions forced upon her by surrounding powerful neighbours; but Spain has sunk under the inevitable influence of a despotic corrupt government, and an indolent, feeble-minded, ignorant people. The one is a nation of farmers, of artizans, of sailors, of shopkeepers and merchants; the other is a nation of place-hunters and picaroons. The great features of the Spanish Exhibition are a set of assassin-like swords and daggers, and the model of a bull-fight. The Dutch have scarcely sent anything that may not be ranged in the class of utility. Their exhibition is by no means equal to the well-deserved reputation of the country. The Dutch ship-builders have sent very little; the Dutch gardeners nothing either in tools or produce; and the builders and engineers have not, as we might have hoped, favoured us with any models of the many curious contrivances by which they manage to pump out and keep out the sea from a district nearly as large as Yorkshire.

Out of 116 specimens exhibited, nearly half consist of such useful but uninteresting articles as lead and other mineral paints, water-colours, oil-cake, patent starch, chicory, wax, ivory-black, dyes—of which ones, polychromate, is a new dye—leather, ropes, brooms, brushes, horse-hair, flax and hemp, veterinary medicines, and other unpicturesque materials. Stearine candles of good colour, great hardness and size, have been sent; but the price seems to afford no prospect of a competition with our English makers, which would be of advantage to consumers. The same may be said of the blankets, some of them dyed a bright scarlet for exportation: the quality is excellent, but they are dearer than English blankets of the same size.

Two carpets of magnificent dimensions, each woven in one piece without seam, from the Royal carpet manufactory of Deventer, are displayed on the west wall, which deserves examination. One is from a Turkey, the other a Smyrna pattern, and they may stand comparison for colour, design, execution, and materials, with anything in the Building. According to our notion, they are just what library or dining-room carpets of a great mansion should be—rich, not gaudy, thick, warm, soft as velvet. The designs have avoided the absurdity of preparing landscapes or flowers to be walked on. Among articles of luxury, we much admired a cloak, muff, and ruffles of a beautiful pearl white, made by Messrs. Hase, of Hague, of the feathers of the *Colymbus cristatus*, a sea bird of the diver species. It is impossible to imagine anything more delicate or more likely



STATE HOWDAH.—EXHIBITED BY THE EAST INDIA COMPANY.—(FROM A PHOTOGRAPH BY CLAUDET.)



SLATE BATH.—BY MAGNUS AND CO.

to harmonise with a rich dress; for so unique an article, which cannot become common, as good skins are very scarce, the price (£27) does not seem extravagant. Zeegers, of Amsterdam, has sent a large wooden folding screen, richly japanned, after a Chinese pattern, like those of the handsome chess-boards and tea-chests our grandfather sea captains used to import as presents fifty years ago. This screen would accord well with one of the carpets.

Among the utilities are to be noted a crane, from Messrs. Enthoven, of the Hague, which has excited admiration among our engineers. With a power of one-tenth, it raises, and at the same time weighs, several tons. Alongside the crane is a sugar-cane mill, one of the many machines for the same purpose within the Palace. A journeyman engineer, who was examining it, declared that it was made by English and by London mechanics: no skill does not go far enough to decide the question. There are a number of mathematical and scientific instruments, including a delicate balance by C. Belher, Arnheim, an astronomical eight-day clock, by Hohwu, of Amsterdam; and a dynamometer for ploughs, by Cazaux, of Vollenhaugh, near Leyden. M. Conrad, Engineer in Chief of the Hague, has models of a crane bridge and of a rolling bridge in use on two of the railways he has constructed—the first near Schiedam, and the other near Leyden. All that we have from the great Dutch shipbuilders is comprised in a few models of boats. From Haarlem, the Hague, and Rotterdam specimens of printing and bookbinding have been sent; among which are Bibles in quarto and folio, "for the use of the Dutch Reformed Church, printed for the Bible Company," with stereotyped plates.

Petit and Fritsen, founders, have exhibited a beautiful set of bells for a chime, which it is to be hoped will tempt some successful patriot to bestow on the steeple of his native town. We need a few more chimes in England.

A diamond ornament, capable of being converted to several uses, exhibited in the Avenue, by a jeweller of Rotterdam, seems to us of surpassing beauty in arrangement, as well as in the colour of the stones.

We cannot flatter ourselves that this Dutch exhibition will lead to any extended commercial relations, unless it be in some of the new inventions. Most of the articles seem dear: for instance, there are some well-worked sticks and whips of whalebone, better than anything of the same material in the Building; but the price has been fixed at £27 per dozen. Now for £2 our London and Birmingham manufacturers will supply a much more elegant whip than whalebone can be made into in any way. At the same time, Dutch manufactures are always sound and genuine.

We had nearly omitted, following the bad example of the jurors, any notice of a gigantic partridge-pie, containing some hundred birds, in an hermetically sealed case; the lid of which is dotted with small samplecases. We trust that this may be *tapped* at one of the farewell banquets of the Exhibition: Dutch suppers can take rank with Scotch breakfasts and French dinners. We have no doubt this monster pie will equal any of the contributions of Chevet, of the Palais Royale, in *pâte de foie gras et de becassine*.

DENMARK.—From this kingdom, harassed by a civil war but lately concluded, nearly fifty contributions have been made, of which a large proportion consist of scientific instruments and works of art, with two or three curious inventions. Among what we may term the truly national contributions and curiosities, are samples of Iceland wool. There are no parties engaged in any special pursuit to whom the contents of the Crystal Palace can be more interesting than to woolstaplers, since it contains more various specimens of the subject of their commerce than have ever before been brought together under one roof: from the frozen shores of Iceland to the burning sands of Western and Southern Africa, from the Highlands of Scotland to Australia, from Spain, SAXONY, Prussia, France, Russia, and the different districts of India, between the Bay of Bengal and the valleys of Cashmere, from Peru and from Patagonia, fleece of varying qualities have been forwarded, of which perhaps the samples from Patagonia, Cashmere, and Iceland are the most rare.

Among the truly national manufactures of Denmark are the knitted jackets, petticoats, stockings, &c., and the black earthenware pots, made by the peasantry of Jutland, which are interesting from their extreme ugliness. It is to be regretted that every contributing nation did not send specimens of its cheap woollen manufactures. Indeed, one of the deficiencies of the Exhibition is the absence of two classes of goods first, those cheap, useful articles which form the staple of the commerce than brilliant costly luxuries; and, secondly, those manufactures which are the remains of a primitive state of society, now fast disappearing before the march of steam-driven and steam-born commerce.

The most remarkable article the Danish department is that of M. Sorensen, of Copenhagen—a machine for composing and also *distributing* type. It is advanced one step over previous attempts at the same object, inasmuch as it performs the second operation; but still the difficulty of punches and "*spacing*" remains, which, after all, has to be done by hand labour.

Messrs. Funch, Jurgensens, and Nissen, all of Copenhagen, each exhibit astronomical and philosophical instruments, which include an astronomical clock, chronometers, double-acting air-pump with one cylinder, scales for chemical analysis, &c. Each of these has its merit not only of accuracy of construction, but of cheapness, and help to maintain the ancient, well-founded scientific reputation of Copenhagen. For our musicians, there are improved flutes, clarionets, and hautboys, by Schloe.

Denmark, in imitation of its great neighbours, has its Royal manufactory supported by an annual grant, for producing porcelain, which is neither cheap nor first-rate. The stock subjects, in vases and imitations of china, are not new: interesting as a set of copies in Parian from Thorwaldsen's works. The best are a figure of the great sculptor, a "Christ Blessing," and a "Theseus."

The inventor would probably be annoyed if we passed without notice "the working model of an electro-magnetic engine;" but what can be said of a model, when it is well known that so far, the difficulty of employing electro-magnetism as a moving power is not mechanical, but FACTORIAL. At present coals are cheaper than any metallic solution.

SWEDEN and NORWAY, countries to which we are indebted for our charcoal-iron for steel; for the art of rolling iron, imported by the *Fiddler* ancestor of Lord Foley; for large quantities of excellent pine timber; and for the novels of Frederika Bremer and the singing of Jenny Lind, have made a very poor display, consisting chiefly of iron in various stages, from ore to manufactured steel. We ought to have had specimens of the native manufactures of the Laplanders, a reindeer sledge, a Norwegian carriole, and a Swedish stove. A well-constructed Swedish stove is a great luxury in a study or hall, as it affords the means of keeping up an even temperature throughout the winter, with very little attention once in twenty-four hours. Being constructed of brick, they have none of the unpleasant dryness of iron stoves We note among the more interesting articles in this section thirty-two specimens of silver in different stages, which have been sent from the Kolmagorg silver mines; furs, and "samples of cotton goods, made in hand-looms by the peasantry of the province of Western Gothland, without any dressing." Altogether, Sweden and Norway have rather given us a proof of their good-will than examples of their productive industry. The remaining contributions of Northern Europe may be summed up in a very few lines.

From HANOVER, among ten contributions, there seems nothing very characteristic. Fire-arms, of course, magnetic apparatus for telegraphs, sail-cloth, a hat on a new principle, a bust of the King of Hanover, and three calf-skins, are fair specimens of the collection from the ancient patrimony of our King.

Preserved vegetables, poultry, fish, fruit, and milk are the most notable of the products of the free city of LUBECK.

MECKLENBURG-STRELITZ and MECKLENBURG-SCHWERIN, two little principalities, whose commercial relations with England chiefly consist in a supply of peasant Princesses and Princes for our Royal family, have sent, the one a hot-plate and a spinning-wheel, the other a sail, three guns, a soup-tureen, and a case of razors.

NUREMBURG, from whence we might have fairly expected a splendid collection of the toys so dear to the hearts of the children of "all nations," has found nothing for us but two specimens of remarkably fine wire—one pound drawn out 76,000 feet in length, and the other for mining lanterns to 41,000 feet.

From Germany we must make a long stride to ROME, from which we have received works of art in the shape of cameos in shell and in onyx, mosaics, a very beautiful model of the three great sepulchres of the Basilica, executed in various stones, and a bust of Pius IX. The cameos in shell should be carefully examined, as we think previously only had an opportunity of seeing common French copies of the same kind. We cannot consider MacDonald's statue a specimen of Roman industry. It is curious to walk from the Roman department, with its scanty collection of pretty toys, all that a principality richly endowed in soil and climate can send, to Switzerland, where nearly two hundred articles, most of which can be sold in foreign countries, are the industry and vigour of a free people.

In taking leave of the productions of Europe, we cannot help regretting that Paris, Hamburgh, and Brussels did not send some specimens of their cheap and elegant furniture, as well as the costly articles of all only for the palaces of noblemen and princes. Those cities can make furniture which is very cheap, and not without elegance. The speculation would have paid well. We suspect foreign exhibitors, in fixing their prices and sending their goods, have been led astray by a vulgar error as to the lavishness of Englishmen. For instance, a set of pretty chairs in the Tuscan department, are priced at twelve shillings each. Very much handsomer can be had of London manufacture for eight shillings.

MISCELLANEOUS CONTRIBUTIONS.—Under this title we may enumerate a variety of what are vulgarly called "oddments," which say nothing for the resources of the country by which they are sent, but help to illustrate the cosmopolitan character of our commerce. For instance, Brazil, an empire containing two million square miles, with a capital, Rio de Janeiro, with upwards of two hundred thousand inhabitants; and another great city, Bahia, with more than one hundred thousand inhabitants, has been content to have its industrial resources represented by a few vases of flowers, made from the brilliant feathers of tropical birds and the scales of the diamond beetle. It is true that Brazilian diamonds and other precious stones appear in a manufactured state among the displays of many European jewellers; and Brazilian coffee, cotton, sugar, and hides, in which an immense trade is carried on with England, appear in the samples of the trade of the port of LIVERPOOL. But we should have been glad to have seen a complete collection, not only of rough diamonds and topazes, but of the great variety of timber and ornamental wood, of the dyes the logwood, Brazil wood, and other raw produce which must be the source of great wealth in that empire, whenever education and commercial enterprise have been substituted for the feeble hastitude of the degenerate Portuguese. We referred to the beautiful leather manufactures of the Brazilian Indians in our article on Saddlery.

CHILI, by the kindness of the Messrs. Schneider, of Broad-street, has a lump of gold ore weighing 3 ozs., to typify the raw material in which she pays for a not inconsiderable consumption of British manufactures. A little of the Chilian wheat would have been acceptable, as rendering more perfect the cereal department of the Exhibition. Both Australia and South Carolina have more than once been indebted to Valparaiso for supplies of wheat at a reasonable price. Through that port a considerable and increasing traffic, much stimulated by the colonization of California, is carried on between the Chilian Republic and our Pacific colonies. We also hoped for some specimens of the sandstone jars which the Chilian potters, either by the exercise of hereditary skill, or by the use of some peculiar clay, manufacture so admirably light, strong, and ringing like metal. If the idea of forming a museum of specimens of raw produce and primitive industry, collected from the Exhibition, be carried out, the deficiencies we have pointed out may be filled up by the private contributions of some of our merchants

MEXICO has been content to be represented by our gold workers and jewellers, and has only sent a few wax flowers and specimens of timber. We have no bottles of *pulque*, the spirit distilled from the cactus, nor any of the cloth or other of the many articles which the Mexican Indian manufactures from a plant which is to him what the palm and the bamboo are to the natives of the East. From the cactus, which grows in the most barren grounds, he obtains good clothing, fuel, thatch, ropes, and even an intoxicating drink to drown the thought of his miserable position.

NEW GRANADA, with its handful of rough emeralds, will be passed unnoticed by many even of the students of, who know not that the little republic of that name contains a narrow slice of land, perhaps more important than any other of the same dimensions in the world. The isthmus and port of Panama are within the territores of New Granada, and it may confidently be assumed, that, if within ten years an EXHIBITION of the Industry of all Nations should be repeated, New Grenada will make no unimportant figure among the contributors of raw produce.

QUEEN POMARE, of the SOCIETY ISLANDS, deserves our best thanks for illustrating the moral industry of her little kingdom—one industry that excited the admiration of Captain Cook and Sir Joseph Banks, "as by gone days when George the Third was King." Her Majesty has sent beautiful mats, cotton cloth, and coronets.

LIBERIA sends a fine specimen of foreign produce, although placed in the midst of our colonial productions, are certain samples of mahogany and wood, and of vegetable wax, from the black Republic of Dominica, in the island of Hayti, which have been sent by our consul there, Sir Robert Schomburgk, the botanist, who discovered in Guiana, and sent to England, the *Victoria Regia* flower.

American Ploughs. A Correspondent writes us, in reference to the article on the Ploughs of the United States, that the Canadian Iron Plough, so far from gaining a prize, was not even mentioned in the Report on the Albany Match. Such, however, was the case. A Canadian who at the time cited it as a proof of the impartiality of the judges.

COLONIAL CONTRIBUTIONS

Our Colonial contributions have been largely increased, and entirely re-arranged, since our early notice of them. In some of our possessions warm interest has evidently been taken in the Exhibition, and pains and considerable expense have been incurred to make their local contributions complete.

BRITISH GUIANA has exhibited, by the agent of the Royal Agricultural and Commercial Society of the Colony, 150 vegetable productions either in a raw or manufactured state, all suitable for permanent preservation in the colonial department of an industrial museum, besides about forty curiosities chiefly connected with the aboriginal Indians of that colony.

TRINIDAD.—The Governor, Lord Harris, has sent a very interesting collection, admirably arranged, which includes everything of importance in the animal, vegetable, and mineral kingdom of that rich South American colonies. Thus, among other specimens, we have "pitch" from the springs in the centre of the Pitch Lake, and every variety of pitch found in or near the lake. Mineral charcoal prepared from the pitch, which is found to be a cheap substitute for animal charcoal in the manufacture of sugar; also, naphtha manufactured from the pitch; and many other articles which are likely to form part of the exports of the colony, when the science and capital of Europe has been directed to their respective properties. Then we have, in the animal substances, tortoiseshell and whale-oil, both articles of export. In vegetables, specimens of cocoa-nut and other oils, spices, cotton, which is not at present, but is likely to become an object of cultivation; and also the fibre of the *Piassaba Bassata*, and agave, of which the native population make cotton and ropes. The "woods" are well arranged and classified.

The Exhibition has been the means of bringing to notice a vast number of ornamental and timber woods, from India, British North America, Van Diemen's Land, New Zealand, our West Indian possessions, and other colonies. It is to be hoped that they will be preserved in some suitable place, and that we shall have a comprehensive report on them from competent scientific and practical authorities [illegible] our communication with distant countries is rendered more [illegible] this facility, in connection with the reduction of the timber duties, ought to afford our cabinet-makers, builders, and shipwrights, some new raw material. We observe that the BAHAMAS, famed for turtle and pine-apples, send, in addition to specimens of the shell-flowers which have long been admired, a very handsome cabinet-wood which grows to a large size, called locally "horse-flesh"

JAMAICA has the unenviable distinction of being unrepresented in the Crystal Palace, except through the kindness of a lady who sent a case of artificial flowers, made from St. Christopher, John Morris, a black labourer, has forwarded a West Indian fish pot or basket, made of the inner bark of a tree. The most noticeable contribution from Barbadoes is a collection of wax imitation tropical fruits and flowers, by Mr. and Mrs. Brathwaite, of that island. Bermuda produce occupies a small table, crowned with a model of one of the celebrated Bermudian pilot-boat.

It will be remembered that Colonel Reid, the courteous and intelligent chairman of the Executive Committee, was Governor first of Bermuda, and afterwards of Barbadoes and the Leeward Islands.

In passing over several trifling West Indian contributions of no especial note, we observe that there are specimens of produce from those sinecure dependencies, St. Helena and the Falkland Islands; two useless colonies, where expensive establishments are kept up, apparently for no other reason than to provide for poor gentlemen of political influence

Of our Australian colonies, the collection of Van Diemen's Land, which is by far the most complete, as it now contains not less than [illegible] separate contributions, has been re-arranged. We owe this [illegible] who wish to know something about the natural productions of our colonies, have reason to be deeply obliged to the committee of the colonists for the excellent "Island Museum" they have provided. The famous manufactures are the most striking part of this department, although the distance is too great for us to expect any considerable importation. Among the purely colonial productions, we note feathers of the musk bird, or scoty pee-ol, which is found in countless numbers in the islands of Bass's Straits—these feathers are much used for pillows, and could be supplied in quantity; gloves of opossum fur and lamb's wool; organ pipes, bored in the solid in Huon pine, a wood applied to a number of purposes; (190) *Mylitta australis*, a sort of truffle, eaten by the aborigines before their destruction by the whites, in a half-roasted state, which has been used by Europeans in soups and puddings; skins of the duck billed platypus; honey and wax from bees, which have now become naturalised, and are to be found building in hollow trees of the forests. The native bee of Australia is black, and scarcely larger than a fly.

The exhibition of South Australia, as compared with Van Diemen's Land, is in inverse proportion to its respective commercial importance. There are barely a dozen articles, but these include specimens of copper ore, specimens of grain, and malachite from the Burra Burra mine, which has afforded £700,000 sterling value of ore, between the date of striking the first lode, in 1846, and 1850. Wool and tallow, the staple articles of New South Wales and other Australian colonies, we have adverted to in another part of our numbers, and have nothing to add, except to recommend to those interested in our woollen manufactures a comparison of the wools of Australia and the coarse tweeds manufactured at and near SYDNEY, with the fine collection from all countries contained in the Crystal Palace. Perhaps ere at this late hour, before the Exhibition closes, a lump of native gold may be added to the display of the produce of New South Wales. If in that colony, as now promised, a second El Dorado be discovered, with its millions of sheep and cattle, it will even far out-do California.

The Canadian section has already been described and illustrated; but it has been in several particulars re-arranged with increased picturesque effect. The leather made from the skins of the porpoise—an entirely new manufacture—has excited the attention of the trade. A pair of shooting-boots of this material, the excellent workmanship having arrived, have been presented to Prince Albert, and acknowledged in a very gracious manner. Among other additions, are some beautiful furs from NOVA SCOTIA, and some asphaltic coal from New Brunswick. The wild-cat skins of Nova Scotia are worth attention for cloak linings, if they can be supplied in any quantity

We conclude our visits to the avenues and bays in which the produce of so many different races, languages, customs, and climates, are gathered together, with an earnest hope that ere long before the Exhibition expires, we may be able, in a second great gathering of all nations, to note and report mighty progress in industrial arts and peaceful civilizing sympathies.

BOOTS AND SHOES.

Most people have had occasion, at one time or another, to complain of suffering produced by the mal-construction of boots or shoes; we cannot but rejoice, therefore, in the announcement, that, according to all probability, a new era for the feet is about to dawn, and such sufferings to become as rare and exceptional as they now are general and abundant. The present Exhibition of Industry offers ample grounds on which we justify this hopeful anticipation. It is an old and popular adage, that there is "nothing like leather:" this we are perfectly prepared to admit, and at the same time to assert an equally popular fact, that there is something very unlike leather, possessing one great property in which leather, as we most of us know to our cost, is too often painfully deficient. This property is *elasticity*, and we need scarcely add that the substance we allude to is *india-rubber*

That the combination of this valuable gum, with the ancient and time-honoured material, is the grand feature of modern progress in the art of boot and shoe making, will speedily become apparent in one review of the articles exhibited in that department. Its importance will be, perhaps, still more fairly appreciated, from the consideration that by its agency boots and shoes of the cheapest and commonest manufacture may be made as pleasant and easy to the feet as those costly specimens of ingenious and studied workmanship hitherto obtainable only by the wealthier classes. Not only does the introduction of elastic textures into the construction of coverings for the feet remove all undue pressure, allow the free and natural play of the muscles, and avoid much wear and disagreeable effort required in getting shoes on and off; not only does it do away with the risk of corns and bunions, the cure of which has sprung into an actual profession, but it abolishes all the cumbrous and fragile machinery of laces, straps, buttons, &c., and renders a boot or shoe as walking-shoe as easy to don as a slipper or stocking—an advantage by no means likely to be underrated by a foot-sore public. That such an innovating invention should neither be brought to perfection at once, nor meet with the immediate popularity and patronage it merits is not wonderful, when we cons der the slow progress of all reforms in established for whether material, social, or political. But that it deserves attention and recommendation as an alleviation of one of the most widespread and troublesome of the smaller evils of life, that is how, some one we imagine, deny. At the same time, it is highly desirable that boot and shoe makers generally should turn more serious attention to the anatomy and natural requirements of the foot, and particularly reform the detestable practice of making the sole as narrow, pinching it in on the inner extremity, contrary to the natural shape of the foot, according to which the great toe, is far from deflecting as they dictate, the fact being that the inner side of the foot requires nearly a straight line to determine the outline of the sole. On this point we took the opinion of an eminent sculptor. Any one may, however, satisfy himself by placing his foot on a sheet of paper, and carefully tracing its outline with a pencil. Though it must be remembered that the constant practice of wearing shoes, such as are generally sold (or rather mis-soled, if jesting be permissible on such a grave subject), speedily destroys the proper shape of the foot by habitual distortion. The contrast between the real form of the foot, and some boots and shoes is positively ludicrous, Another fault of which almost everybody complains is want of height in the instep. This cause exquisite pain, and is one of the accidents which India-rubber is specially calculated to remedy. India-rubber will also render it much easier to get a ready made fit; indeed, when its application is perfected, it will be as safe to send for a pair of boots or shoes by giving the number of the size, as it is to send for a pair of gloves. The majority will always buy their shoes ready made, therefore this is no small recommendation.

We commence our critical inspection of the goods exhibited in this department of industry, with Mr. Sparkes Hall, of 308, Regent-street, bootmaker to the Queen, who exhibits a curious set of imitations of the shoes of various reigns, shewing the marvellous changes of fashion at a glance. There is the elegant pointed shoe, so well calculated to show the form of the foot, of the days of King John and Henry III. There is the preposterous looped up shoe of Edward IV. There is the round-toed, broad, comfortable, and rational shoe of Henry VIII., with its slashed openings, rendering all compression an impossibility. There is a large-mouthed, free-and-easy boot of Charles II., so popular on the stage; and William III. shoe, which but for the anachronism, we should feel inclined to set down as the aboriginal Blucher. But, as a maker of boots and shoes for his living contemporaries, Mr. Sparkes Hall is, as may be imagined, a patentee of valuable india-rubber webbing, to enlarge the sides of boots, which evidently forms his grand claim to distinction.

Mr. J. Medwin, whose specimens occupy part of the same stall in the Main Avenue West, is another patentee of the resilient boots, also a registered elastic constructor.

Ramsbottom's substitute for shoes and clogs are rimmed with iron as strongly as a horse's shoe, and appear calculated to defy the wear and tear of time.

W. Thomas and Brothers, of 128, Cheapside, exhibit boots and shoes made without stitches, pegs, nails, or rivets, with India-rubber sides, &c., and boots with gutta percha soles

We here see a new and extremely interesting application of the innovating principle, whose we have already characterised as the leading feature of improvement in the manufactures. A curious pair of topboots are shown by Mr. Godever, of 16, John-street, Crutched Friars, which weigh only 3 oz., and can be made to order in two hours, and sent by post. The first pair were made for a jockey, in order to reduce his weight to the required standard.

Some perspiration absorbing waterproof boots by Currie, of Pantonstreet, Haymarket, if they realise their title, fill up a long required desideratum

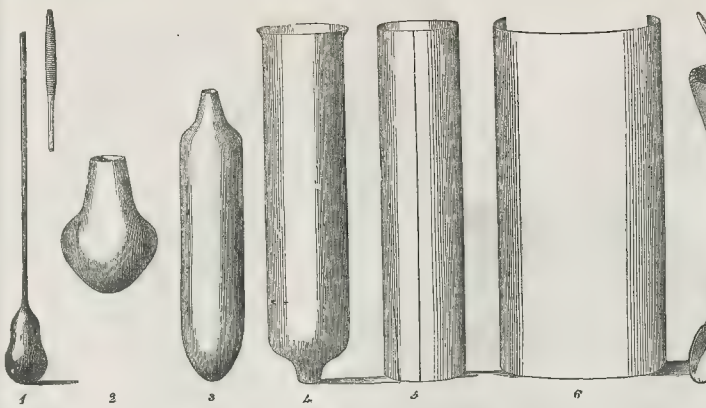
The springsided boots by Wildsmith, of Sherrard-street; the sidecopedes of elastic, of silk, with cork soles and elastic waistpieces (Dowie's patent), are also worthy of notice. The latter give freer play to the bend of the foot than ordinary soles. Of this invention we speak from experience, as also of the elastic webbing of Mr. S. Hall, above alluded to

Mr. Clarke, of Southampton-row, is also an elastic inventor, and exhibits boots and shoes for tender feet. He also has casts and lasts for deformed feet, &c.

Hartley's polish enamel is a preparation for giving a permanent polish to ordinary boots, of which the exhibitor shows some excellent specimens.

Directed by a placard, we found the remainder of the British boots and shoes in the South-east Gallery, where more elastic-sided shoes, by S. H. Heath, of 33, Poultry, and others, claimed our attention.

A waterproof boot, by O. Faulkner, of 90, Wigmore-street, offered a



EXAMPLES OF GLASS-BLOWING. BY HARTLEY AND CO.

ractical proof of its virtues by actual immersion in a pail of water. In the case of C. Hubert, of 302, Regent-street, is a shoe with the toes istinctly drawn, made without seam, and strongly suggestive of the torure inflicted by boots less accurately correspondent with the forms of ature. The boots exhibited by Mr. Hubert are of extreme elegance and erfection of manufacture.

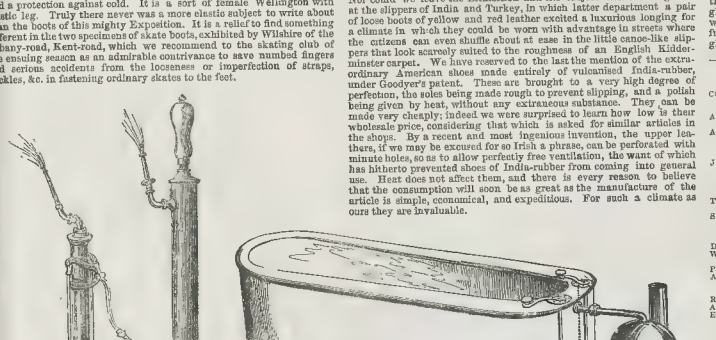
The ladies' Victoria boot, by E. Walker, of 19, Whitecross place, Wilon-street, Finsbury-square, is intended to act as a support for the ancle nd a protection against cold. It is a sort of female Wellington with astic leg. Truly there never was a more elastic subject to write about han the boots of this mighty Exposition. It is a relief to find something ifferent in the two specimens of skate boots, exhibited by Wilshire of the Jbany-road, Kent-road, which we recommend to the skating club of he ensuing season as an admirable contrivance to save numbed fingers nd serious accidents from the looseness or imperfection of straps, uckles, &c. in fastening ordinary skates to the feet.

GARDEN SYRINGE BY TYLOR AND SONS.

Mr. Schaller claims to be the sole inventor of the mackintosh overshoes; Becket of Fenchurch-street, of the *Tri bicio elastico*, or invisible spring boot, which we mention, were it only for the remarkable name which its imaginative inventor has conferred upon it.

A. Robert, of 123, Regent-street, exhibits very beautiful dress boots. Hoby, the most famous in story, the pet of the fashionable novelists, who have stereotyped his name with that of the illustrious Stuis, and a few more fortunate tradesmen, displays some boots of waterproof leather, to be cleaned in the ordinary manner, of undeniable make.

The foreign boots and shoes are mostly destitute of any striking novelty in make or fashion; yet the specimens of Hungarian boots with iron heels and pointed toes are curious as an illustration of national costume; and the splendid slippers of embroidered velvet, and morning boots with turn-up pointed toes of yellow embossed leather, by Anton Kunert, of Vienna, may interest some of our dandies and *petites maitresses*. Some very handsome slippers are also to be found in the case of M. Bathié, member of the Academy of Industry at Paris and inventor of the *inhotsoutlier*, for which, in the hope that wooden shoes will soon be traditionary in *la belle France*, we are not disposed to give any extraordinary credit. Nor could we leave the Exhibition and the subject without a glance at the slippers of India and Turkey, in which latter department a pair of loose boots of yellow and red leather excited a luxurious longing for a climate in which they could be worn with advantage in streets where the citizens can even shuffle about at ease in the little canoe-like slippers that look scarcely suited to the roughness of an English Kidderminster carpet. We have reserved to the last the mention of the extraordinary American shoes made entirely of vulcanised India-rubber, under Goodyer's patent. These are brought to a very high degree of perfection, the soles being made rough to prevent slipping, and a polish being given by heat, without any extraneous substance. They can be made very cheaply; indeed we were surprised to learn how low is their wholesale price, considering that which is asked for similar articles in the shops. By a recent and most ingenious invention, the upper leathers, if we may be excused for so Irish a phrase, can be perforated with minute holes, so as to allow perfectly free ventilation, the want of which has hitherto prevented shoes of India-rubber from coming into general use. Heat does not affect them, and there is every reason to believe that the consumption will soon be as great as the manufacture of the article is simple, economical, and expeditious. For such a climate as ours they are invaluable.



PORTABLE BATH.—BY TYLOR AND SONS.

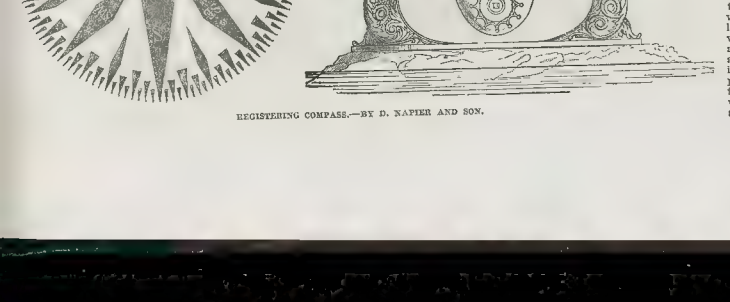
Before concluding our notice, we think we may venture to assert that we have made good our promise of demonstrating by modern instances that elasticity and India-rubber are the great signs of the times in the boot and shoemaking reform to which the manufacture of the age is destined.

PORTABLE BATH, GARDEN SYRINGES, &c. BY TYLOR AND SONS.

Tylor and Sons exhibit a very comfortable-looking bath, copper, enamelled to the appearance of white marble, in a mahogany frame, with a cocks for hot, cold, and waste water; and, in addition, fittings for a shower-bath, warm or cold, with a pump for the purpose of raising the water. The peculiar advantage of this production, however, consists in there being attached to one end of the bath a small stove, which, at a small expense of coals, will heat the water whenever required for use. In another Engraving, in the same page, we represent two of Tylor's garden syringes, which are remarkable for the simplicity and neatness of their construction.

REGISTERING COMPASS. BY D. NAPIER AND SON.

This compass registers upon paper the exact course which a vessel has been steered for twenty four consecutive hours. Its object is to enable the Captain at any time to ascertain if the ship has been steered correctly, and, if not to show the period of error, and the amount of deviation.



REGISTERING COMPASS.—BY D. NAPIER AND SON.

EXAMPLES OF GLASS-BLOWING. BY HARTLEY AND CO.

Messrs. Hartley and Co., of Sunderland, in addition to a variety of specimens of glass available for various purposes, as windows, conservatories, &c., exhibit a series of models illustrative of the manufacture of crown or sheet glass, the examination of which will prove highly gratifying to those who take an interest in the great productive arts of the country. Some of these we have engraved, including the melting-pot, which stands nearly five feet high (No. 7 on the cut). No. 1 shows the blow-pipe and ball of metal, as taken from the pot; No. 2, sheet glass as formed by the blower in a wooden mould; No. 3, sheet glass when swinging in the process of blowing; No. 4, sheet glass when fully swung; No. 5, sheet glass when finished by blowing; No. 6, sheet glass when partially flattened.

HORNBY AND KENWORTHY'S PATENT SIZEING AND DRESSING MACHINE.

THE model of the sizeing and dressing machinery, patented by Messrs. Hornby and Kenworthy, is placed contiguous to Harrison's power-loom, towards the north-west angle of the Machinery in Motion department, the invention being now the property of Messrs. Joseph and W. Harrison, of Blackburn. This machinery is used for the purpose of sizeing, dressing, or preparing the warp threads, by causing flour paste to be combined and retained with the fibres of the threads, so that they are made more tough and smooth for weaving. It is worked in connection with the patent warping or beaming machine, a model of which is exhibited by Mr. W. Kenworthy of Blackburn, but which is likewise the property of Messrs. Harrison. In the process of the cotton manufacture, before the yarn is taken to the warping machine, it is wound from the cop on to bobbins of about four inches long and three inches diameter: these bobbins of yarn are then taken to the warping machine for the purpose of the threads being laid equally parallel to each other so as to make them into a beamed warp and to facilitate their arrangement after being sized and placed in the heald or "heddles" of the loom. In the old system of preparing the yarn, before its being placed in the loom, a cumbrous machine, termed a warping mill, was used instead of this improved machine of Mr. Kenworthy, which warping mill was worked by hand after the yarn had been made into a balled warp; it was then taken to the old kind of sizeing machine, which soaked the yarn into the warm size, then squeezed it between iron rollers, afterwards dried it, and in the next place it was re-balled. The warp was then taken from this machine for winding it on a roller-beam, after which it was removed to the looming-frame, and next to the loom to be woven into cloth; but now, by the connexion of Mr. Kenworthy's warping machine with the sizeing machine of Messrs. Hornby and Kenworthy, the process is much simplified, and is withal systematic and mechanical. It will be seen, on reference to the warping machine itself, in the Exhibition, that the bobbins containing yarn are so placed in a wooden frame, called a "creel," that they will revolve; the threads are then passed through a "wraithe" on to a roller beam, the wraithe being required for the purpose of keeping the threads separate and uniformly in the order in which they are intended to be wound off

FRAME OF MINIATURES. BY T. CARRICK.

(after having passed through the size) on to the weaver's yarn beam In this machine is a beautiful adaptation of mechanism by which the yarn may be backed off the beam, if by chance any broken thread should escape the eye of the operative and get on the beam: this motion consists of a series of small cylindrical rods, so arranged that the threads of the yarn pass under them, and supposing none of the threads to break during the process, the beam would get filled without any necessity for calling this invention into action; but it so happens that breakages often do occur, and as the machine works at a rather quick speed, those severed threads get on the beam before the operative has sufficient time to stop the machine the machine is provided with two sets of driving pulleys, one pair at each end of the driving shaft, the pair which drive the backing-off motion working at one half the speed of the other: the leathern straps or bands which connect these pulleys with the main shaft of the factory are so arranged by the one, (that which drives the backing-off motion) being crossed, and the other being open, the that motion of the machine can be reversed. Whenever the thread is are broken, the operative, therefore, effects the stoppage of the machine by simply passing the open strap off the fast pulley to one revolving loosely on the shaft, he then reverses the motion by passing the crossed strap off a loosely revolving pulley on to the fast pulley, thereby turning back or backing off the threads from the beam: the series of cylindrical rollers then perform their office by moving down slots made in the framing of the machine, in their progress bearing down with them the threads backed off the beam until the severed thread is discovered and united, when the operative sets on the machine as before the breakage took place, and the cylindrical rollers to their former position. After the beam is filled by this machine, it is placed along with five others in the improved sizeing machine, in bearings so that they will revolve at the left end of the machine, having weights upon their pivots, in order that they may be kept in their places, the six threads of yarn are then passed through an ordinary comb bar, or "wraithe," and thus divided equally until passed through the healds, which in this machine are situated at the left end, for the purpose of effecting the cross-shed, and thereby taking the "lease," previously to the yarns being submitted to the sizeing process. The lease now being taken, and the cross-band or threads being introduced for the purpose of "looming," or drawing in of the weaver's beam, the threads of yarn are passed over a wraithe, or comb-bar, formed by a row of teeth or rods of intervening spaces, for the purpose of laying the threads in parallel breadths, side by side, and forming each division or band of threads (of any required number) into separate and distinct tapes or sheets (of any desired width), each thread being laid parallel side by side, and thus in lateral contact, the wraithe, or comb-bar, being allowed to vibrate or oscillate freely as the threads proceed. The continuous threads being thus made or separated into breadths or bands, are now passed over a conducting roller, and immersed into the trough containing the sizeing material, which is here kept in a heated state by steam passing through a pipe into the trough, and thus boiled into the warp threads as they are passed through it and under the adjustable tension roller, which can be adjusted to any required degree of tension at pleasure, or can be raised up when necessary entirely out of the trough by means of a winch, worm, and rack, with which the pinions of the rollers are connected. The threads are then passed forward through a pair of squeezing-rollers, and again similarly immersed in the trough containing the size to finish the yarn, from whence they are passed around the drying cylinders, also heated by steam, and now assume the form of tapes or bands (the sizeing material, by its adhesive properties, causing the threads to adhere slightly together), and thus proceed in a tape-like form, being, of course, much stronger, more regular, and less likely to be broken or disarranged than by the old mode of sizeing. A circular revolving brush is placed above the threads as they proceed over the drying cylinders, for the purpose of dressing or laying the fibres, and making the tapes or bands more compact and even. They now proceed in a sized, dried, and finished state, being conducted by two rollers through a similar wraithe, or comb-bar, but of much finer pitch, and by passing through which the bands of threads are passed edgewise and again similarly divided by the oscillating or vibratory action of the comb-bar, and laid over the tension roller at the right hand end of the machine in a proper state to be received and wound upon the warp beam ready for the operation of drawing in, after which operation it is taken to the loom and woven.

An improved self-acting marking apparatus is connected with this machine. Upon the end of one of the revolving guide rollers is a worm, working into a small wheel on the end of a shaft, at the reverse end of which is a small mitre wheel driving a corresponding wheel upon another shaft, which carries at its other end a revolving marker, alternately dipping into a box of colour and marking the warp threads therewith as it revolves; it thus marks out any desired length of warp for the pieces of cloth intended to be woven, and allows the warp beams to contain accurate lengths without waste in the looming The combination, therefore, of the division of the threads into bands, the arrangement of the "healds" for obtaining the cross-shed in taking the "lease," previous to dressing or sizeing the new forms of "wraithes" or comb-bars, and the self acting marker, with the improved construction of the mechanism employed, constitute an important improvement, and is of great benefit in the preparation of yarns for weaving.

The sizeing machine is equally well adapted for sizing flax: it stands in about the same space as the old dressing frame, takes less power, does nearly six times the quantity of work, and is calculated for coarse or fine mule or throstle yarn, and with the assistance of a good workman will run off fully 1000 cuts per week of 5½ days, of nine-eighths wide, 66 reed, and 26 yards long.

FRAME OF MINIATURES. BY T. CARRICK.

These miniatures are exhibited as specimens illustrative of the application of white marble as a material for painting upon, being durable, and little affected by light or atmospheric influences. Amongst the group will be recognised many familiar faces, as those of Lablache, S. Rogers (the author of "The Pleasures of Memory)," Macready, Lord Lyndhurst, the Duke of Wellington, O'Connell, &c

THE ILLUSTRATED LONDON NEWS

SECOND SUPPLEMENT.

VOL. XIX.] SATURDAY, SEPTEMBER 20, 1851. [GRATIS.

THE GREAT EXHIBITION.—GROUP OF ARMS IN THE FRENCH DEPARTMENT.

We have already more than once remarked upon the splendid decoration lavished by the French gunsmiths upon their weapons of offence and defence, giving all the attractiveness and charm of a plaything to the engine of death. For this ornamental manufacture the gunsmiths of Paris (Devisme, Lefaucheux, Delacour, Lepages, Claudin, and others) are especially distinguished; and the display which they make in a northern bay leading out of the Foreign Nave, daily attracts the attention of those interested in warlike operations and field-sports. Our Engraving comprises a group of the most striking of these productions.

THE CLOCK-CASE SHOP.

VISIT TO A CLERKENWELL CLOCK FACTORY.

CLERKENWELL has long been noted for the manufacture of every description of clocks. There are, however, not more than about half a dozen clock manufactories on a large scale, the work being, for the most part, done by those who are known as small masters, employing one or two journeymen or apprentices, and who attend entirely to particular branches of the trade; for instance—there are the dial enameller, the hand maker, the pinion maker, the wheel cutter, the fuzee cutter, the spring maker, the movement maker, the pendulum and barrel maker, the carver, the case maker, the clock-glass maker, the French polisher, and the finisher: so that, when a clock of a particular construction is ordered of one of the small masters, he has to depend on more than a dozen workmen, living in various parts of the district, for the several distinct portions of work required to complete the clock. Delay after delay is the consequence. "The wheel-cutter is so much engaged," or "the case-maker has deceived me," and such like, are among the reasons for disappointing, again and again, the anxious inventor of some horological improvement. It is quite obvious, therefore, that a factory which embraces all the various branches of the business must possess considerable advantages, especially when all the operators are under the immediate superintendence and practised eye of the principals.

Our attention was lately directed to such an establishment in St John's Square, Clerkenwell, belonging to Messrs. J. Smith and Sons, which occupies the site of the once famous clock manufactory of Colonel Magniac. One of the principals kindly attended to us during an entire day, which we spent in examining closely the various operations necessary in producing a clock, and also several beautiful machines employed in facilitating some of the more difficult and tedious processes.

We, in the first place, noticed the stock of mahogany which is introduced into the yard, around which the various workshops are placed, direct from the West India Docks. The mahogany logs, which are from 18 inches to 3 feet square, and from 6 to 20 feet in length, are in the first instance cut up into boards, varying from three-quarters of an inch to 2 inches in thickness, which, for the purpose of seasoning, are racked in the open yard, in a horizontal position, for about two years; after which period they are transferred to a shed, and placed in a vertical position, being separated from each other by a rack at top. Here they remain for three years, after which they are ready for use. For clock-cases intended for hot climates, the additional precaution is taken of stacking the boards at about seven feet above the glass-bending kiln. There are three kinds of mahogany used—Spanish, Cuba, and Honduras; oak is also used, besides maple, rosewood, satin, and other fancy woods. At the saw-pit we observed some logs of oak being cut up, of a rich brown colour, which is only attained by great age; the logs in question were at least 200 years old.

The principal divisions in the manufacture of a clock are, the brass-founding, the glass-bending, the case-making, and the clock-making.

Brass-founding.—Every piece of brass-work used in a clock made at Messrs. Smith and Son's establishment is cast in the foundry, at the east end of the yard, as seen in the Engraving. The furnace, which is under the level of the floor, is constructed chiefly of Stourbridge bricks; the ash-pit is in front, and covered over with a grating. Gas coke is sometimes used, but coke of a harder description, similar to that made for locomotive engines, is preferred. The casting-pots used are made chiefly of clay and powdered coke, and are formed with a small spout, but without any handle. When the metal is put into the melting-pot, the founder places it into the furnace by means of tongs of a peculiar shape. The pots are of conoidal form, some of which will hold 50 lb of metal, which consists of about two of copper and one of spelter, or zinc, for most purposes in clock-making; but the quality is altered at pleasure, for particular purposes, by changing the proportions of the copper and spelter respectively. For turret clock-work, gun metal is used instead of brass.

The casting trough is made of wood with sloping sides, and is placed opposite to the furnace. The sand used for taking the cast is from Hampstead Heath, and is mixed with loam from the same locality, in the proportion of about one half of the latter to one of the former. This is the only description of sand used by all London brass founders. All the various pieces of brass required in the construction of a clock can be cast at the same time. The impression of one side of the article to be cast is first taken in the sand from a suitable pattern, the sand having been firmly pressed into one half of an iron frame or mould; the same process is observed with regard to the other half. When the two half frames are put together by means of casting boards, one at top and the other at bottom, and secured together by means of wood-screws, ridges are formed in the sand from each sinking or impression into the main channel which terminates with an opening on the side of the frame, through which the liquid metal is poured, and which fills up all the cavities. While the metal is being poured into the mould, it is placed with one side towards what is called a spilling trough, which receives the waste metal escaping from the pot. In a few minutes the boards are taken off, the sand removed, and the rough articles of brass are separated from each other, and removed to the various shops.

Brass-finishing shop.—In this department the clock rings, or bezels, are turned by the lathe, the hinges being let into the rings and soldered, and the whole subjected again to the operation of turning, and finally finished. Here, also, the dials are silvered. The cases for the clock weights and pendulums, which are of sheet-brass, are also made in this shop, at one end of which is a forge, which is principally used for forging the hammer stems, pulley frames, pinions, repeating work, &c., of turret clocks, which are brought to great perfection at this establishment. Here, also, the brazing and soldering are effected. The sheet brass is cut out by means of large shears, with as much ease as a piece of card-board with ordinary scissors. At the other end of the shop is a manu-motive wheel cutting machine, specially used for cutting out from the solid brass the wheels for turret clocks. It consists of a large fly-wheel, which is turned by hand, communication from which is effected by a round band passing to a 4-inch pulley fixed on the spindle of the cutter, by which the teeth are formed; the frame containing the cutter is furnished with both a horizontal and vertical movement, by which the exact portion of the wheel to the cut is regulated. Underneath the frame is a projecting arm, the use of which is to keep the wheel in its place during the operation. The

THE BRASS FOUNDRY.

number and size of the teeth of a wheel of any given diameter are regulated by a circular brass plate of about 18 inches diameter, through which are perforated different series of holes, ranged in concentric circles.

Besides the wheel-cutting engine, there is another machine of a different construction, used for cutting the pinions for church clocks. It is furnished with a cutter, which rotates at considerable velocity on a stationary axis; the pinion is moved horizontally underneath the cutter, which is so constructed that it not only cuts the slit in the pinion, but also shapes the leaves at the same time.

The dials are made either of sheet tin, iron, or brass, the faces of which are coated with what is technically termed *white-flake*, a superior kind of white-lead, which is ground down with the finest description of copal varnish, and then put into a stove, similar to that used by japanners, until it becomes sufficiently hard to receive a polish, which is effected chiefly with pumice-stone, by which means a most perfect surface is produced, ready to receive the figures, which are painted with lamp-black, varnish, and turpentine.

The church clock dials are coated four times with black paint, and sized and gilt in the ordinary way; the gold, however, for this purpose, is of extra thickness. The divisions of the dials are set out by means of an index plate. Opposite to the wheel-cutting engine, as above described, is a simple and ingenious contrivance, for grinding the edges of clock and watch glasses. The operator stands in front of the work, with his right hand turning round a handle, placed vertically above the bench, and with his left hand holding a sort of hood, or, as it is called, cup, supplied with emery powder, by which the grinding is partially effected: the glass to be ground is temporarily fixed on a box-wood mallet, by means of cement, at the top of a spindle, which passes through the bench, and to which rapid motion is communicated by a round band from a horizontal wheel below the bench, turned by the right hand of the operator.

After the grinding is completed, the edge of the glass is smoothed with pumice stone, and finally polished with oxide of tin, usually called putty-powder.

The glass-bending shop is situated on the south side of the yard, and is fitted up with furnaces and an annealing oven.

The crown glass, used for enclosing the dials of clocks and watches, before being moulded or bent into the required form, is first cut into circular shape by means of a circle-cutter, which consists of a circular board, covered with wash-leather, which is made to revolve on a pivot by one hand of the operator, while with the other hand he presses down a diamond on to the glass; the diamond is fixed at the end of an adjustable arm, which traverses a slot, the exact diameter of the circular plate to be cut being regulated by an index fixed at the side of the slot. The circular flat plates, which are removed to moulds turned out of

THE REGULATOR AND GENERAL CLOCK [illegible]

THE TURRET-CLOCK SHOP.

solid fire-stone, the sinking of the moulds being of flat elliptical section, are put into one or other of the furnaces, according to the size of the glass to be bent: while in the furnace, the mould is kept in continual circular motion by the long iron rod of the operator, until the glass sinks into the required form. The size to which glass is bent at this manufactory is equal to 30 inches in diameter. The grinding and polishing the edge of the glass is the next operation, which has already been described as being carried on in another part of the premises.

The clock-case making department (of which we furnish an Illustration) is situated on the floor above the "brass finishing shop." Here is manufactured every kind of case, from the ordinary office dial clock to the elegant ornamental case of the first-class regulator. The variety of designs followed to suit particular tastes is rather astonishing.

In order to produce the most beautiful work, as well as that of the most sound description, the external covering is produced by laying on veneers, an operation requiring considerable care, by means of *ossils*, which are simply pieces of wood of the shape of the articles to be veneered, made hot and screwed down close to the foundation on one side, and the veneered lining on the other: thus, the soundest work is produced, and the cracks and flaws so commonly seen in inferior cabinet-work are thus avoided.

Each bench in this shop is furnished with a *German screw*, by which the work is more firmly held together, and closer joints effected, than by the ordinary screw attached to the English bench.

In the course of construction we observed a very handsome case for a first-rate regulator, which is now to be seen at the Great Exhibition.

The buhl-work of brass and mother-of-pearl, &c., which is let into some of the clock-cases, is produced by a machine called a "neddy," which derives its name from the workman standing across the body of the machine. The pattern intended to be used is first cut out in brass, which serves as a type from which to print any number of copies on thin paper: these paper patterns are pasted on the brass, pearl, wood, or other suitable material intended to be used. By means of a treadle worked by the left foot of the operator, the work is readily shifted; while with his right hand he cuts out the work by means of a very fine saw, made of a watch spring, and having exceedingly fine teeth on one edge.

Adjoining the case-maker's shop is a department entirely set apart for the "system plan," each man attending continually to one particular branch of the business; thus, to one is assigned the barrel making, to another the pinion work, or what is known among clock-makers as filing in the movement, and so on.

There is one machine in this department which especially attracted our attention, and that is called a "fuzee engine," by which the spiral grooves are cut in the solid brass intended for the fuzee. The brass is put upon a steel arbor, placed between two centres; the operator with his right hand presses a triangular sliding bar, furnished at the end with a steel cutter against the brass, while with his left hand he turns a handle in connexion with a sliding frame, on which is a brass bar placed at any given angle so as to regulate the size of the spiral groove; this bar is adjusted by means of a segment at either end. By this machine the grooves of fuzees of from three-quarters of an inch to the largest size required are readily cut.

On the south side of the yard are two clock-makers' shops—the one on the upper floor being entirely devoted to the finest and most delicate kind of work required for bracket clocks, regulators, &c.; and the lower one on the ground-floor solely for the works of turret and church clocks. (Views of both these shops are engraved in our present Number.) In the upper shop we observed every kind of tools required in making and finishing the various parts of a regulator, which we had the opportunity of examining in order. First, the frames, which are constructed of thick brass: these are hammered, and then pinned up and filed square; the pillars by which the two frames are connected, are next turned, and fitted with large screws; after this the arbors of the pinions are subjected to the turning process, by means of a turn-bench, worked by a drill-bow in the left hand of the workman. The bank-cook and the crutch, the thumb-screws, and other brass works are then roughed out; and, finally, the several parts are finished, chiefly by means of a hand-lathe turned by the workman's left hand, while the cutting tool is held in the right hand. For ordinary descriptions of work a common foot-lathe is used. After the several wheels have been finished by means of the "throw," or hand-lathe, they are fixed on to their respective arbors of steel, and the depthening tool is now brought into action, by which the exact positions of the centres of motion are determined, in order to make the necessary perforations in the frames for the pivots of the pinions to work in. This tool consists of two similar horizontal pieces of brass, hinged together and turned up at each end, to receive a socket-piece, also of brass, and placed horizontally; there are four of such socket pieces, on the inside of each of which is a *centre-piece* to receive the pivots of the wheels and pinions, and on the outside a steel pointer, by which the centres of motion are marked on the brass frames with the utmost accuracy. Thus the wheel and socket is placed on the arbor between the centre-pieces in one section of the depthening machine, and the pinion into which it is intended to work on the other: the relative position of wheel and pinion is regulated with great accuracy by means of an adjusting screw, by which the two portions of the machine are either brought nearer together or removed further from each other as required. The maintaining power, consisting of the barrel, the main-wheel, the going ratchet, and the two clacks, the brass dial plate, with the hands of steel, and the compensation mercurial pendulum of glass, with its steel rod and index, make up the several parts of the regulator. In the lower shop, in which turret work alone is constructed, the lathes are of a stronger description, and the tools generally more nearly resemble those in use in the best turning shops of the kingdom.

After visiting the various manufacturing departments of the establishment, we were finally conducted to the show-rooms, which contain an extensive assortment of eight-day skeleton clocks, representing various ecclesiastical edifices, some striking the hours on a cathedral-toned gong, and others chiming the quarters on eight bells. Then there are regulators, hall clocks, musical clocks, and bracket clocks, in cases of old oak, mahogany, and rosewood, both carved and plain, many of which are of elaborate design, and all produced at this establishment. Nor are these clocks solely for the English market, but also for China, Turkey, and other parts of the world, as we discovered by the curious characters on the dials answering to our numerals.

WOULD THAT WE COULD!

(ANSWER TO THE FOLLOWING.)

Come forth, ye toiling millions! God's universe is fair.
Come forth from crowded street,
And cool your feverish feet
With a trample on the turf in the pleasant open air!

ILLUSTRATED LONDON NEWS, May 17.

Ah, would that we could!
With a shout of delight, and steps bounding and light,
That would fain tread the hill-top, and rase with the wind;
With our hearts full of glee, and our glad spirits free,
How soon should we leave the thronged city behind!

Ah, would that we could!
Pent in darkness and gloom, bending over the loom;
In the workshop and office, dark alley and lane;
What a pleasure to rove through the deep shady grove,
Or to stroll through the valley, or bound o'er the plain;

Ah, would that we could!
Where the sun its bright beams through the dull window streams,
And we hear the caged lark warble forth its sweet lay;
When we dream of the flowers in the green leafy bowers,
How we long for the fields at this zenith of May!

Ah, would that we could!
But in fancy alone, where the soft glades are strown
With the beauties of Flora, alas! we can stroll.
By sleeping lake ponder, by dewy mead wander,
Alone in the beautiful dreams of the soul.

Ah, would that we could!
When perchance we peruse the sweet themes of the Muse
When the beauties of nature inspire the rich song;
When the Poet reveals all the pleasure he feels,
Then our wish becomes stronger, ay, doubly strong.

Ah, would that we could!
Then health's rose-tinted bloom would in beauty resume
Her right place on each cheek, now so pallid and wan;
Then our strength would increase, our complainings would cease,
And all that we suffer from, quickly be gone.

E. D. F.

TAXIDERMY.

(*To the Editor of the* ILLUSTRATED LONDON NEWS.)

SIR,—I have just read in your excellent paper Mr. Waterton's strictures upon the taxidermy in the Great Exhibition; and, with all my respect for that eminent naturalist's opinion, I cannot bring myself, being an exhibitor in that art, lamely, in my own case, to submit to them. The peacock I exhibited, when I left it there, was, I felt convinced, a very near approach to the peculiar character of that bird when its wondrous train is expanded. Now, possibly, having no case, the currents in the Building may partially have disarranged the tail feathers. During the process of stuffing the bird (which occupied, for want of leisure, several months), I made the Rye bird my study; and if that is not *the real principle of taxidermy*, I know of no other: the mechanical processes are merely accessory. The creature must be seen alive, to be stuffed properly. If any person is curious enough to compare some snowy owls in the Exhibition with one *alive* in the Zoological Gardens, he would hardly know them to be birds of the same species. It was my intention to offer the peacock, when the Exhibition was over, to the British Museum; and I think I cannot do better than fulfil that intention: perhaps Mr. Waterton will allow it is good enough for that purpose. May I beg the favour of the insertion of this note.

I have the honour to be, sir, your very obedient servant,

J. B. P. DENNIS.

Bury St. Edmunds, Sept. 8.

(*To the Editor of the* ILLUSTRATED LONDON NEWS.)

Newcastle-upon-Tyne, 15th August, 1851.

In the Supplement to your Journal of the 26th July, there appeared an article on the Taxidermy of the Exhibition, from an able correspondent, to the justice of whose remarks every unprejudiced visitor must assent.

In the following week, Mr. Waterton, apparently jealous of the praise bestowed upon some of the exhibitors, informed your readers that he had declined to exhibit, although requested to do so—that he is dissatisfied with the natural history in the Exhibition—and that the mode of preparation universally followed in taxidermy is so devoid of real principle, that he who follows it, however clever he may be, will never succeed in producing exact copies of nature's true form and appearance.

Mr. Waterton's method is well known to taxidermists; but will that gentleman have the goodness to inform your readers how he knows by what method the respective exhibitors have prepared their specimens, which he can only have seen from the outside of the cases? The only principle one would imagine that a taxidermist ought to adopt, is to produce, as nearly as he can, a representation of the natural object.

It is to be regretted that Mr. Waterton did not comply with the request made to him, and allow the public, who, after all, are the best judges in these matters, the opportunity of comparing his performances with his pretensions. It is too much to expect, that, lacking this opportunity, they are to receive, unquestioned, Mr. Waterton's dogmatical assertion, that the works of those who have had the manliness to challenge examination, and some of which have received the approval of every one but himself, are devoid of real principle, and are not exact copies of nature's true form and appearance.

If Mr. Waterton really believes in his superior powers as a taxidermist, and wishes to convince others of them, it is surely his duty even now to apply to the Executive Committee to admit his specimens. Let them be placed in the Transept alongside of Mr. Hancock's cases: "palmam qui meruit ferat." From my acquaintance with the productions of these two gentlemen, I do not hesitate to predict, that, in the judgment of every scientific naturalist and every intelligent observer, Mr. Waterton must yield the laurel.

Your obedient servant, J. W.

FRENCH AGRICULTURE.

THE four Engravings, presented on this and the opposite pages, are careful and faithful representations by a French artist of phases of French rural economy and industry. The merry time of "harvest home" has finished in our southern and midland counties and in the north; in the rich Lothians and the equally fertile regions of Moray and Ross; the reapers are even now in the field, gathering, we trust, a plentiful crop of the teeming fruits of the earth. We have thought it probable, therefore, that at this particular season of the year, our rural friends—and, let us hope, our urban friends also—grateful in calling to mind the prosperous ingathering for the year in which we have recently been engaged, will look with interest and pleasure upon a series of faithful representations of the husbandry of our neighbours across the Channel, of how they manage these things in France.

Not better, certainly, than in England; on the contrary, over the greater portion of the great kingdom of France, much worse. We have much, doubtless, to learn in agriculture; our farmers have long been wedded to old custom and hampered by old prejudices, but the start has been made. With the downfall of enervating corn laws there seems likely to spring up a new era of active and enlightened rural industry. The farmer will be put in the position of other manufacturers. He must strive hard, and exert all his ingenuity to grow as much as he can, as cheaply as he can, and—already, we believe, he has manfully set his shoulder to the wheel—he is learning, he is endeavouring, he is applying scientific means to the cultivation of land, and the ultimate result, sooner or later, will certainly be the advancement and elevation of the agricultural body and the general good, arising from general cheapness, of the great bulk of society.

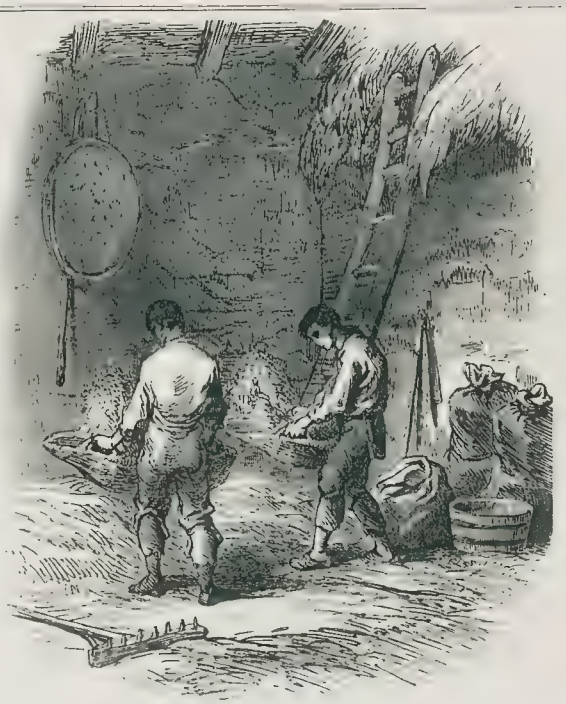
In France no such progress is taking place, at least, in a general and national point of view. The Engravings we give will show at a glance the backward and old-fashioned state of matters. In reaping, the old-fashioned hook is still used, and the corn is cut so roughly and irregularly, that the stubble left on the ground is often of all heights, from an inch to a foot. The rude and shapeless form of the stacks, as represented in another Engraving, is of no great importance in itself, but is symbolic of the slovenly, and far from ship-shape style of managing farming matters in general. The winnowing process, represented, may have been practised by the patriarchs. It is only in the extreme northern parts of Scotland that we have seen corn winnowed by the primitive expedient

HARVEST IN FRANCE.—STACKING.

of leaving two opposite doors of the barn open, and then flinging up the grain and the chaff into the thorough draught thus created; but last season, visiting soon after harvest time the magnificent corn growing plain of the Beauce, a vast expanse of table land, lying between the valleys of the Seine and the Loire, and popularly called the "granary of France," we found in the barns of the French farmers the antiquated practice of the remote north in full operation. Winnowing machines, we ascertained, on inquiry, did exist, but they were few and far between. In the northern portion of France, towards the Belgian Frontier, the best and most scientifically cultivated district there is, no doubt, plenty of mechanism of this kind; but, crossing the Loire, and advancing into the regions of the centre and the south, we find agriculture and agricultural implements in the rudest state, not much advanced, in fact, from what they were in the old times of the wars of the Fronde. The fourth cut represents the common costume of the French small proprietor going forth to labour in his own patch of ground. The blouse is a blue one, and looks better than our smock-frocks, because it keeps longer clean. The Artist has represented him with shoes and gaiters, but he wears sabots just as often. The spade is for digging, instead of ploughing up his croft of land, a most uneconomical way of preparing it for the seed; the large-bladed, short-handled hoe—all the hoeing tools of the French peasantry are painfully short-handled—is probably to be used in loosening the earth round the roots of his vines; the string seen crossing his chest supports a bag with some coarse bread, onions in the north, and garlic in the south, with perhaps a tin mug, containing milk and water, or *piquette*, the latter a sort of winy vinegar, made of the last squeezings of the grape-skins, with the addition of water. The wife, or daughter, of the workman carries to him his dinner of hot, sweet, vegetable soup.

We have hinted that French agriculture is far behind English. French soil is generally more fertile than ours, but yet we manage to extract considerably more than twice as much from it. Much as we have to learn, we are at all events learning it. The French agriculturists are not; they are making no advance; they are sinking to the notions and pursuing the plans of their grandfathers and great-grandfathers. Hardly an improved implement will they allow

HARVEST IN FRANCE.—REAPING.



FRENCH AGRICULTURE.—WINNOWING.

to be introduced—hardly a new scheme or theory of cultivation will they accept. "What did for our fathers," they say, "will do for us, and ought to do for our sons." The fact is, however, and it is the misfortune of France, and of its system of social economy, that you hardly ever find living permanently in the country any members of the more enlightened and intelligent, because educated, classes. French people of the better sort have no taste for rural life. They may come down to the *châteaux* for a couple of autumnal months, to shoot, and hunt, and fish, but they know nothing of farming affairs, and take no interest in the science of the cultivation of the earth. Let the farmers but pay their rents, and the one thing needful has been accomplished. Thus, there are few or no country gentlemen in France, resident magistrates, active farmers, enterprising experimentalists, as many of our country gentlemen in England are. We have travelled in purely rural distr.cts for days and days, and never encountered a person above the rank of the poor, honest, ignorant, blouse-clothed boors. All the mental activity of France—all its learning, enterprise, and fermenting ingenuity—are bottled up in the towns. All the brain of the country, in fact, flows naturally towards the towns. Little notabilities flock to the chief places of the *arrondissement*, or the department, and plunge into all sorts of political intrigue, with the view of coming in for Government patronage the amount of which in France is perfectly enormous—just as all the bigger notabilities, and the stronger and more daring minds of the provinces, struggle up to Paris, and there enact the same career on a grander scale. The fool of the family only is left—in that significant French sneer—*au fond de sa province*—to attend to the putting down of seed and the taking up of corn. So much for the better classes. The actual farm labour is conducted entirely by uneducated boors—kind, honest, excellent people, but living in the densest ignorance, and walled in by the most hopeless prejudice. A French farmer is seldom in any degree removed above the hinds whom he employs. They live together, labour together, eat together, and of the same food, talk the same *patois* and share in the same ideas, or rather the same want of them. The master has no feeling that he is socially above his servant. Mere accident has made him the farmer, the other the hind—but they labour in the same field, with the same tools, and in the same fashion. There are no directions, no orders, passed from one to the other; and for the simple reason that the man knows as well what is to be done as the master can tell him. Everything goes on by old routine rule of thumb. Their fathers sowed, and reaped, and thrashed, and they sow, and reap, and thrash, exactly in the same fashion. The whole rural practical population are in, point of fact, placed upon the same table-land of ignorance and prejudice.

FRENCH AGRICULTURAL LABOURER

Another curious influence which tends to equalise master and man is the result of the extreme sub-division of property. Although there are many vast estates, and very many moderately large ones, in France, the great majority of the working peasantry are small landowners in their own right. In some districts this rule is universal. How often have we heard the phrase in answer to our enquiries—"*Oh—dam—voyez-vous: tout le monde a un morceau dans ce pays-ci.*" The possession of land, indeed, is the one ambition of a French peasant. Offer him good wages, and a comfortable abode as a farm servant. No; he will prefer to eat maize and rye, and drink water on his own patch of earth, and in his own hovel erected upon it. Some of these patches, however, have, by the constant process of subdivision—which, be it remarked, does not, as has been asserted, stop with the interests of the parties, but goes on in spite of them—dwindled gradually down to mere spots, from which not one human being—to say nothing of a family—could derive a subsistence. The landowner is then, per force, driven as a farm labourer into the service of the nearest farmer, to whom he pays a certain small sum, generally deducted from his wages; in return for which the farmer ploughs, sows, and reaps the patch of his dependent, of course, handing him over the fruits. We remember how strangely it sounded, when a farm labourer in the frontier of the Beauce told us that he was ploughing, for behoof of his master, his own land, and that to-morrow he would be ploughing his neighbours', for that all the small proprietors in the vicinity, unable to subsist upon their patches, were in the service of a farmer who performed for their land what they could not do themselves.

One of the consequences of the subdivision of property system is, that a vast proportion—we fear we may safely say great majority of the smaller proprietors, particularly in the south and east—are over head and ears in debt. As dependent upon the soil as an Irish squatter, when the portion of each became too small for him, he was obliged to buy more land. To do this he had to borrow money in the neighbouring town, mortgaging, of course, his old and his newly acquired property; and as it too often happens that the rate of interest to be paid to the mortgagee amounts to nearly as much—in some cases to quite—as much, as the mortgagor can, by his imperfect cultivation, extract from the land, the necessary consequence is grinding poverty and hopeless embarrassment. It is, we believe, from this vast mass of peasant suffering that the French socialists in great part recruit their ranks. The people are desperate, over head and ears in debt, with no prospect of working themselves clear, paying what they consider an exorbitant interest to idle people living on their money in town. It is from such a state of things as this, that M. Fourrière and M. Proudhon win their proselytes. It is from this great mass of struggling, desperate poverty, that we hear proceeding, or by which we hear ratified, the dictum, that *le propriété c'est le vol:* and it is from these ranks that there rises the ominious battle cry of *à bas les riches!*

The general sum of wages of a French labouring peasant is 30 sous, or 15d. per day. He is frequently paid only one franc, and receives the remaining moiety of that sum in food at his master's house. His meals, in point of quantity, would suit the most voracious chaw-bacon in England; but, as regards quality, we fear that Hampshire and Somersetshire would turn up their noses. Bread and vegetable soups and stews form the staple nourishment of the French peasant. In summer he makes four meals a day. Breakfast he takes before going a-field, in the shape of an unlimited supply of hot savoury and wholesome soup, made, however, for the most part, without meat, but aided by vast hunches of bread, baked of coarse flour in the north, flour and maize or flour and rye in a great portion of the central districts, and entirely maize or entirely rye in many parts of the south, particularly in the valleys of the Pyrenees. Dinner is a repetition of the breakfast, upon, if possible, a still larger scale, and the soup may be a thought more generous by the addition of a very small quantity of meat, which, in the form of *bouilli* boiled to rags is served in the fluid which it has contributed to strengthen. The dinner takes place about noon or one o'clock. An afternoon meal, called the *goûter*, consists of bread and a morsel of cheese, seasoned, perhaps, with an onion or a clove of garlic- and supper, about sunset, repeats once more the eternal procession of soup and bread. Of course, in different districts, there are varieties in the bill of fare, but bread and soup are the corner-stones all over France. In the south, for instance, oil is greatly used: we have seen it poured over bread like butter. In the fruit season a vast quantity of the produce of the orchards and gardens is dispatched. Indeed, in grape-growing countries, during the season, a peasant would almost as soon dispense with his bowl of soup to begin with, as his cluster of grapes by way of dessert. Wine of the thinnest and sourest sort is scrupulously mixed with water, and even then drunk in very small quantities. Indeed, their glorious grapes have often seemed to us to be thrown away upon the French altogether; they appear, from the highest to the lowest, to care so little for the exquisite fermented produce of their vineyards. Indeed, we verily believe that if all France could be polled upon the question, the decision would be, by a large majority, that the nation would rather eat their grapes than drink the wine made of them. Were it not for the foreign demand, half the vineyards would go out of cultivation, the care and skill bestowed in rearing the plants for the higher class of wines would be extinct in a season, and very little of the produce actually made for France would rank higher than a common and unflavoured *vin ordinaire*.

NOOKS AND CORNERS OF OLD ENGLAND.

CRYPT UNDER GERARD'S HALL, BASING-LANE.

The original edifice, the vaults whereof, represented in the accompanying Cut, are the only remaining vestige, was erected by John Gisors, *pepperer*, Mayor of London in 1245. Stow describes it as "a great house of old time, builded upon arched vaults, and with arched gates of stone, brought from Caen, in Normandy." A modern inn has replaced the ancient hall, which had latterly been divided into a number of apartments, and appropriated as a common hostelry, under the tutelage of "Gerard the Gyant," one of the fabulous worthies of Cockaigne in the olden time.

This giant is said, by tradition, to have been the founder of the hall

CRYPT UNDER GERARD'S HALL, BASING-LANE.

which bears his name, and a great pole which stood in the place was shown as the staff used by Gerard in the wars "to run withal;" but, whether before or after his foes, is not stated. A ladder was likewise exhibited, which served to ascend to the top of the staff; and in the neighbouring church of St. Mildred, Bread-street, hangs a great iron helmet, said to have been worn by the said *gyant* for the protection of his jobbernowl in battle. "The pole," says Stow, "might be used of old time (as then the custom was in every parish) to be set up in the summer, a May pole, before the principal house in the parish or streete, and to stand in the hall before the screne, decked with holme and ivie, at the Feast of Christmas. The ladder served for the decking of the May pole and roofe of the hall."

The groined roof of the vault is supported by sixteen pillars; and the

EFFIGY OF GERARD THE GIANT

walls, of great thickness, are composed of strong rubble, faced with Caen tone. At one end of the crypt is a large door, now built up; another, much smaller, communicated with a narrow passage near the opposite end, opposed to which is a similar door, both of which have been altered at a later period by the insertion of depressed arches. It may be remarked, that the floor of the passage between these doors returns to the tread a hollow sound, indicating an open space below. According to local belief, here commenced a subterranean communication with the Tower of London, of which Sir John Gisors was Constable in the reign of Edward II., at which time he was accused of tyrannical and unlawful conduct, and being called upon to answer for his behaviour, he fled, and took part with the French monarch against his native King.

This crypt, although in general character resembling the subterranean appurtenance of an ecclesiastical edifice, may be considered as having been constructed solely for the stowage of merchandise, and in this respect it has a striking interest as an example of the warehouse of a great London merchant of the 13th century, a period when night sometimes went before right, making it expedient that a man's house should be his castle in a sense more strictly literal than as laid down by the legal commentators. The great house called the *Vintrie* stood upon similar vaults, which were appropriated for the storage of French wines. It was likewise inhabited, in 1314, by Sir John Gisors, who was a vintner.

Gerard's Hall is condemned, with the other houses on the south side of Basing-lane; and its crypt, a venerable relic of old London, after an existence of six centuries, is about to succumb to the undeniable demands of utility and public convenience. It might have been hoped that a subterranean position would have secured its permanence; but the requirement of a solid foundation for the new erections intended to widen the thoroughfare between Tower-street and St. Paul's Churchyard, seems to forbid an exception in its favour, unless some strong exertion for its preservation may yet prove availing. The strength of its masonry might well be urged as offering an adequate support for a castle, and more than requisite for such edifices as the bricklayer of the present day sets up, a succession of which it might support, and survive in its stability six centuries to come. The obliging host of Gerard's Hall can attest the strength of the masonry, from his experience in cutting a passage through the wall of the crypt for the extension of his cellarage—an undertaking which proved as arduous as the excavation of so much solid rock. The effigy of Gerard the Giant, which appears conspicuously over the entrance to the hostelry, is a fair specimen of a London sign, made, to all appearance, when the second Charles was King. It stood originally by the door-post, but the present proprietor had its ancient timbers carefully readjusted, and placed it in its present honourable position.

LITERATURE.

EIGHT YEARS IN SYRIA, PALESTINE, AND ASIA MINOR, from 1842 to 1850. By F. A. NEALE, Esq., late attached to the Consular service in Syria. Colburn and Co., Great Marlborough-street. 2 vols.

The title of Mr. Neale's book informs the reader accurately of its sources, and supplies an estimate of its nature. It consists mainly of descriptions of the present state of the different towns and cities of Syria, and their environs, sketches of the manners of the inhabitants, and a great variety of anecdotes concerning them. At the end of the book is a brief itinerary, and various journals and voyages from town to town are narrated; but it is not travels, nor statistics, as might be expected from a Consular officer, though it contains some notices of the trade of Syria and of the trade of England with that country; it is a book of much pleasant reading, illustrating the lives of all classes in Syria, from the porters and camel drivers to the Seys and Pachas. The Druses and other mountain dwellers in Syria, have of late been frequently mentioned, and now having this description of the townspeople we possess more information of that country than ever before. In fact, European civilisation is by steamboats and journals extending its influence to the Levant, and we now consider ourselves to an extent that still alarms the fanatics amongst the Mussulmans. We quote an example :—

"Adana is a large and populous town, prettily situated on the banks of a river. In the centre of the river are moored innumerable little floating flour-mills, which in the distance appear like so many steamers, with their paddle-wheels in full action. The bazaars are handsome, and the principal street of more than a mile in length. On either side of this street are the shops, magazines, and bazaars; and immediately behind, the closely walled up private residences of the inhabitants, who are all Turks. Of these shops there is a long line of shoemakers' shops, and I found that the trade of shoemaking is or some undiscovered reason considered by the Moslems a very honourable one. The Turkish shoemakers are always busy; but in Adana they were beyond all endurance, and were up upon the ground and raised in a perfect fever of work.

"Much were these people engaged at the brilliant marriage-procession got up to celebrate the nuptials of the young lady to whose wedding we were invited. Such a thing had never before been heard of in the annals of Adana, as Christians daring to parade their streets in broad daylight, with musicians and flags, and hatted and capped Franks-fashion, in horror of horrors! Such a thing as unveiled Christian women. The shoemakers would have torn us limb from limb, had they possessed the power; but the Pacha's lieutenants and other subordinate officers, who were armed with long cudgels, encouraged the Christians to openly check upon their insolence; and many a bearded Turk got such a flogging that day, as he had never had from his childhood upwards. I believe every soul in Adana, man, woman, and child, was turned out upon the ground and raised a

Fearful to continue my route after dark, as I could not then find safe foot-holds nor avoid gulches and ravines, yet doubtful where to pitch upon a secure campspot, I at last came to a sheltered position under a tree, which seemed unlikely to attract the observation of the Indians, and relieved myself from my burden and rested my limbs. It was some time, however, before I could make up my mind to light a fire, for fear of Indians; but a couple of cayotas and a tiger-cat, which had shown themselves just before dusk, settled my wavering doubts: I had been accustomed to the howling of wolves, but was more inclined to risk the chance of being discovered by Indians, than incur the more certain probability of being grappled by a grizzly bear in the darkness."

THE TRAVELLERS' FIRE.

"The gum trees and fire of this country are admirably adapted to supply the wants of the traveller; for if the weather be dry or so wet, he has only to strip off the bark from its base to find the wood perfectly dry underneath; a few chips cut out with a hatchet are easily kindled to set light to the foot of the tree, which, once fired, burns gradually and surely, throwing out a genial heat without spreading or blazing. I generally selected a tree about three feet in diameter, choosing one so inclined as certain to fall in a contrary direction to the wind, which served to keep up the fire, and whereon it fell to burn to me unscathed."

By the help of some Christianised Indians, he reached Stockton, got back to San Francisco, returned to Adelaide, and, finally, to England. San Francisco has undergone some transformation since the author saw it, and is much improved. Destitute as he was of experience, and of the spirit of make-shift, he is a bad guide for determined and skilful emigrants, who should not be deterred from making their fortunes in California, if so disposed, by the disappointments of Mr. Shaw. At the same time, his book supplies information, and should be read by all who contemplate a visit to California, or are merely in search of amusing reading at home.

EDUCATION, AS A MEANS OF PREVENTING DESTITUTION, &c. By WILLIAM ELLIS, Editor of the "Outlines of Social Economy," &c. Smith, Elder, and Co., Cornhill.

Mr. Ellis, in many perhaps be necessary to inform some of our readers, has acquired considerable reputation as the author of some excellent books for teaching political economy, and the social sciences generally, to youth, and of a work on the formation of the understanding, for the especial benefit of schoolmasters. He has, moreover, written some valuable political-economical tracts, one, in particular, on competition, which are much admired. He is, besides, an active practical teacher in the Birkbeck and other schools. To these good works he zealously devotes much time, and, probably, no inconsiderable sum of money. In conjunction with Mr. Hunter, the teacher of the Birkbeck School, at the Mechanics' Institute; Mr. Levett, Mr. Cave, and others, in London; Mr. Combe, Mr. Simpson, and others, in Edinburgh, and elsewhere, he has succeeded in making the study of the social sciences generally a favourite one. We have been stated that there are as many as 4000 schools in which they are now successfully taught. This is probably too large a statement; but it is certain that they are taught and learnt with pleasure in every part of the empire, and that a great masses of our youth are getting a very superior and rational education, of which the bulk of the community knows little or nothing. That such an education may lessen destitution, is highly probable, but not proved it. Possibly it may be prevented by a complete knowledge of all the laws on which man's welfare depends; but the community, as yet, are far from having attained such a knowledge, and, till it be attained, nothing can prevent it. Possibly the mechanics' Institute; Mr. Levett, Mr. Cave, and others, in London; Mr. Combe, Mr Simpson, and others, in Edinburgh, and elsewhere, he has succeeded in making the study of the social sciences generally a favourite one. We have been stated that there are as many as 4000 schools in which they are now successfully taught. A FEW DAYS IN THE LAKE DISTRICT.—No. II.

THE following tour is projected more especially for the pedestrian and horseman, but may be used, except in one or two cases (which will be pointed out in their proper place), by those who prefer a car.

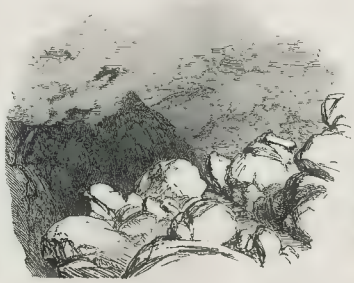
Premising the tourist at Keswick, and wishing to make a three or four days' foray, he will proceed by the eastern shore of Derwentwater

STOCKLEY BRIDGE, TOP OF BORROWDALE.

to Lowdore waterfall, pass the village and bridge of Grange—"subject of sketches innumerable"—and enter the secluded and romantic valley of Borrowdale.

One mile beyond Grange stands the Bowder, or boulder, Stone (see View), a detached rock weighing nearly 2000 tons, and resembling a vessel resting on its keel; on the right, at a short distance, is the beautiful eminence of Castle Craig, from which, West says, "the views are singularly great and pleasing;" and, indeed, if one of the finest views of Derwentwater, with its isles and guardian mountains, is not considered worthy the climbing Castle Craig to behold, the would-be tourist had better keep to his ottoman and indulge in "the pleasures of imagination;" for, undoubtedly, few other spots in Britain possess such manifold attractions. One mile further is the little village of Rosthwaite; and half a mile further, the one Chapel and pretty parsonage of Borrowdale. From near this, a road on the left leads to the village of Stonethwaite, and by a mountain pass into Langdale; proceeding by the road on the right, Seatollar, a neat residence, a little way on the road diverging from Borrowdale by Howlster to Buttermere, is presented to view.

Cross Seatollar Bridge; and forward three-quarters of a mile to Leathwaite Bridge, by a road presenting many charms. On the left is the limpid "Grange," and the extremely narrow valley with its miniature fields, and occasionally a small farm-house or cottage. Its eastern boundary is Keppel and Hind Crags and the sonorous Ginamara. On the right the road is almost bordered with the favourite beech-fern and overhung with trees, which extend backwards on the steep mountain sides to an immense height: but at intervals patches have been cleared for cultivation, and the skirts of those enclosures present features somewhat new in the mountain districts. The trees, without distinction, are "pollarded," the 'Carver Holen," with a bole of four to five feet girth, bearing as vigorous



PART OF STYHEAD PASS.

a spread of branches as the ash. On reaching Leathwaite Bridge, the pedestrian will keep the right bank of the river (leaving the road), to visit the celebrated yew trees—

——— fraternal four of Borrowdale,
Joined in one solemn and capacious grove.

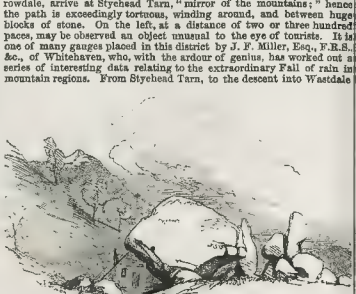
A little beyond the yew trees is the celebrated plumbago or wad mine, its site marked by a path from the wooden Far Bridge, and the *débris* of the excavations. Following the pathless river-marge, Stockley Bridge (see View) is reached. Rude are the materials of Stockley Bridge, and crude, perchance, the scientific skill of its peasant architect, yet there is a grace in its outlines in keeping with the wild scenery around; below, a foaming torrent; above, a quiet pool, fringed with graceful ferns; and behind, a background of rifted crags and noble mountains.

The traveller by car, having crossed the river at Leathwaite Bridge, and passed through the small and solitary hamlet of Leathwaite, will now have to depend upon a pony to bear him from here over Styehead

CRUMMOCK WATER, LOOKING TOWARDS SCALE HILL.

Pass to Wastdale Head, five miles, or probably to Strands, a further distance of six miles, before he can engage another.

From Stockley Bridge, the path winds the steep breast of Aaron End. The pedestrian may leave the path, and proceed a short distance on the



BOWDER STONE.

right, to peep into Taylor's Gill, a fine rock-girdled cascade; regain the path, or keep by the stream, and occasionally take a retrospect of Borrowdale, arrive at Styehead Tarn, "mirror of the mountains;" hence the path is exceedingly tortuous, winding around, and between huge blocks of stone. On the left, at a distance of two or three hundred paces, may be observed an object unusual to the eye of tourists. It is one of many gauges placed in this district by J. F. Müller, Esq., F.R.S., &c., of Whitehaven, who, with the ardour of genius, has worked out a series of interesting data relating to the extraordinary Fall of rain in mountain regions. From Styehead Tarn, to the descent into Wastdale

the view is most magnificent: on the right are the green and great Gable Mountains; in front is Lingmell, over whose rugged top peer the pikes of the mighty Scawfell—"chief of England's mountains;" on the left are Great End and Sprinklingfells. The descent of Styhead into Wastdale affords a view eminently beautiful. Far far below is the narrow valley and its interesting stone walls, its tiny chapel, and few and far between dwellings, its giant mountain, and partially seen lake (Wastwater); but it is not until the valley is reached, that the mountains can be fully appreciated. Great Gable, Yewbarrow, Lingmell, and the Scawfell, separated by the awful chasm of Mickledoon, are there seen in all their glory.

From Wastdale Head to the lake the road winds along the base of Yewbarrow; thence along and nearly parallel with the lake shore for three miles and a half, affording on every side scenery of the wildest grandeur: on the left, across the lake, are the stupendous "screes," on the right the steep sides of Middlefell and Buckbarrow, while the road ascends and descends, or winds to avoid the formidable crags, which here present an interesting geological feature, viz. the glacial theory of Agassiz. At the foot of the lake is Wastdale Hall, a site commanding a beautiful panoramic scene. Half a mile before we reach here, our View is taken. The masses to the right are the screes; next Scawfell and Lingmell, under the clouds, which completely obscure Scawfell Pikes, the highest ground in England, 3166 feet above the level of the sea. The dark conical mountain in the centre of the view is Great Gable. Yewbarrow bounds our prospect to the left. Between it and Great Gable is seen the dark edge of Kirkfell, itself an oasis of the mountain desert, seated amid luxuriant woods and fertile meadows: it boasts a thriving pinetum, foremost of which is the *Auracaria* of Norfolk Island, and the weeping *Deodar* of Nepaul. A little below this is a ravine in the screes, called Hawl or Hole-gill, containing several exquisite miniature cascades, and there the delicate filmy fern grows with unwonted vigour. Arrive at Strands, with choice of two hotels, and proceed to Gosforth by a road affording some pleasing views of the vale of Ravenglass. Arrived at Gosforth, the church forms the sole object of interest in its ancient and

WAST WATER, FROM GOSFORTH ROAD, NEAR THE FOOT

A FEW DAYS IN THE LAKE DISTRICT.—No. II.

sculptured cross, the quaint epitaphs of the tombstones, and its peculiar cenotaphs. From Gosforth by the high-road to Calder-bridge, three miles; *bait* at the quiet and highly respectable hostel of Mrs. Clarke, or at mine host's of the "Golden Fleece," W. Jackson, champion of the wrestling ring. One mile from the village are the celebrated ruins of Calder Abbey, mentioned, and view given, in the first route. About a mile above the Abbey are the remains of a Roman or Danish camp. From the Abbey or the camp the pedestrian may trace the course of the "winding Calder" to the wooden bridge at Thorneyholme; then keep the left or west branch of the river for a distance of about two miles to a rustic and frail wooden bridge, spanning a chasm of the rocks—crossing it and seeking the nearest farm-house, he will receive instructions to find the road leading to Ennerdale-bridge.

The traveller by car or pony will have to keep the fine mountain road over Cold-fell to Ennerdale-bridge, one mile before he reaches which, our view is taken; thence to the boat-house or "Angler's Inn," on Ennerdale Lake. From the windows here the view is extremely beautiful. Across the lake, on the right, is Cragfell, Revelin, and the bold rocky Angling Stone; in front is the Side, Iron Crag, &c.; and nearly closing the head of the valley stands the imposing Pillar, with the pinnacled pillarstone on one side, and the water-shed of Windyett on the other. On the left from the boat-house is Herdhouse; below it is

ENNERDALE WATER, FROM CALDER BRIDGE ROAD, ONE MILE FROM ENNERDALE BRIDGE.

LOWESWATER.

Bowness Knot, a fine craggy knoll; and still lower, the wooded promontory of Whinsey Crag: beyond, in range with Herdhouse, is the Cop, Red Pike, Highstile, and High Crag, which terminates the view on the eastern flank of Ennerdale. Near the head of the lake is Smithy-beck: there and on the opposite shore are iron slag-heaps, testifying that the adventurous Roman (for there are no records to the contrary, and even

BUTTERMERE CHURCH.

tradition is silent) had penetrated this lonely region, and forged fetters for a people from their own soil. Leaving Ennerdale, the tourist, if walking, may proceed between Bannafell and Herdhouse, tracing the stream to its rise and over the ridge (leaving a peculiar cop or hill on the left) to Fiontern tarn, a desolate, inky-looking sheet of water. From the tarn he will follow its discharging stream till he reaches Loweswater. By pony or car he will keep the high-road, through the ancient village of Lamplugh, cross the common, and by a precipitous descent (from which there is a remarkably fine view) reach the head of Loweswater (see View). The wood leads along the shore of the lake, across and around the foot of which, on the skirt of Melbreak, are some pretty pastoral scenes, farms, cottages, and white-washed chapel. A house on the left is said to have been an early residence of Lord Brougham; on the Scale Hill, "a right good hostel" for a sojourn. From thence, pleasant, well-kept walks, through Lanthwaite Wood (see View), lead to Crummock Water: from this it is optional to boat or walk along shore, at the foot of Melbreak, to Scale-force waterfall, a distance of four miles; then to the village of Buttermere, two miles further. Boating is to be preferred, as the scenery from the water is most magnificent, looking towards Scale Hill (see View). Melbreak towers proudly on the left; in front are the Lanthwaite Woods, and on the right are the lofty Grasmoor Ladhouse, Whitefield, and Whiteless Pike. Turning round, and looking up the lake, the scenery is equally fine. Beyond Melbreak, rises Red Pike, Highstile, and High Crag terminated by Honister Crag; on the left is the house, and black promontory of Rannerdale Knot, which has been partially blasted down to form the roadway, even now almost overhanging the darkly deep water. Pony and car will keep this road from Scale Hill to Buttermere. Buttermere has long been known to one-half the world by the dramatic story of its rustic beauty, "Mary of Buttermere," and will now become known to the other half through the misadventures of its "Sandboys" family on their visit to the Great Exhibition. Half a mile from the village is Buttermere Lake, 1¼ mile long, situated in a romantic region. From the foot the scene (see View) is one of savage grandeur: on the right is the steep side of Highstile, enlivened by the foamy cascades of Sour Milk Force; beyond is High Crag; and at the head of the dale, Honister Crag, 1700 feet high, gloomily frowns down on the lonely hamlet of Gate's Earth. On the left is Buttermere Moss, and at its foot the road leading by Honister pass to Borrowdale. Before leaving Buttermere, the tourist must see Scale Force, about two miles distant: he may take a boat on Crummock and land on the opposite shore, or follow a path leading through the fields between the two lakes, and cross the stream by a rustic wooden bridge; then on by the shore of Crummock till he meets the stream of the force; tracing it up a short distance, the loftiest waterfall of the lake district (loftier than Niagara) will meet his gaze. At first sight he may feel disappointed; as it is after climbing the first and insignificant fall, and having entered the narrow gorge, he feels the utter and impressive loneliness of his situation: a stream of water (scant though it may be in very dry weather) falling perpendicularly 156 feet—the cold misty spray—the twilight gloom—the fretwork of branches against the strip of sky above—and the red sienitic rocks clothed with a luxuriant growth of the rarer ferns—altogether form a scene of uncommon interest

Leaving Buttermere by the Hanse road, the Chapel (see View) attracts attention, from its extremely small size; yet it is built on the site of one which contained only seven sittings—sufficient, too, for the population of the dale. The road at the summit of the Hanse is 800 feet high, and from thence descends to the Vale of Newlands—a romantic defile amidst lofty mountains; thence by way of Portinscale to Keswick.

CRUMMOCK WATER, FROM LANTHWAITE WOODS.

BUTTERMERE, FROM THE FIELDS AT THE FOOT.

THE NEW COAL-WHIPPERS ACT.—At the close of last session, a new act of Parliament for the regulation of the coal-whippers of the port of London took effect. It is entitled, "An Act to continue and amend an act for establishing an office for the benefit of the coal-whippers of the port of London." There are 50 sections and a few forms in the new law, which is to continue in force until January, 1856. Some of the provisions are similar to the enactments in the former act. The Board of Trade has the appointment of three commissioners, and the city of London and the chairman of the coal-factors may each appoint one commissioner; they are to be styled "Commissioners for the Registration and Regulation of the Coal-Whippers of the Port of London." The chairman is to be annually appointed. All coal-whippers employed are to be registered, unless they have been registered. The coal-whippers' office is to regulate the proceedings under the commissioners. Tackle is to be found for the use of vessels discharging cargoes. Where a cargo is to be discharged by coal-whippers, the shipmaster is to apply to the office, and the wages are to be paid to an officer attending therefrom. There is an alteration in the payment of wages, declaring that a ship-master is not compelled to pay them but on board the vessel, which wages are to be paid to the men after certain deductions. The commissioners are empowered to make by-laws for the government of the coal-whippers, and for the management of the office, which by-laws are to be submitted to the Board of Trade, and the board is to signify their approval or disapproval of the same within four weeks. The other provisions principally relate to the recovery of monies and penalties. A "Freedom Fund" is to be established for the benefit of the men. All moneys, after the payment of wages and fractions to the fund, are to be paid into the Chamber of the City of London for the purposes of the act.

BIBLES AND PRAYER-BOOKS.—A parliamentary paper, obtained by Mr Hume, has just been printed, containing a copy of the letters-patent under which the Queen's printers, Messrs. Eyre and Spottiswoode, exercise their privilege of printing Bibles and Prayer-books, and Acts of Parliament, as also an extract from a charter of the 11th Charles I., by which the University of Oxford claims the right of printing Bibles and Prayer books. No return has been received from the University of Cambridge. It appears that George IV. granted letters-patent to Andrew Strahan, George Eyre, and Andrew Spottiswoode, and to their assigns, &c., as Royal printers, for and during the term of 30 years, to commence from the 21st of January, 1830. The University of Oxford claims the right of printing Bibles and Prayer-books under several charters, and more especially under the one mentioned. The right is stated not to be barred or limited or affected by any letters-patent since granted, according to several decisions in Chancery and in the House of Lords, in all of which the right was distinctly recognised.

BRUSSELS EXHIBITION OF THE FINE ARTS.

THE triennial exhibition of pictures by Belgian artists was to have taken place in Brussels this year. The occurrence of the Great Industrial Exhibition of London suggested to the Government the propriety of enlarging the limits of the ordinary "Exposition des Beaux Arts," and, instead of restricting it exclusively to the works of native artists, to invite original paintings, sculpture, engravings, and medals from living artists of all nations to the hospitable Belgian Exhibition; the rather so, as, except in an industrial point of view, such works of art are excluded from the Exhibition of all Nations in London. Accordingly, a Royal decree, of 19th March last, authorised the establishment of the exhibition which has recently been opened and regulated, the admission of works of art, the distribution of medals for excellence, and the purchase of pictures by the Government, by private individuals, or by a lottery, the tickets to which are 10 francs each. A temporary building has been prepared for the reception of the 1479 works of art of every description, forwarded from all parts of Europe. It is erected in the courtyard of the Museum of Industry, the buildings of which form three sides of a quadrangle, the fourth side being the Rue du Musée, in which is situated the English Church. The *locale* of the Exposition, without having any architectural pretensions, is not the less suitable to the purpose for which it is erected. It is rather Byzantine than anything else. An elevated porch occupies the centre, with an advanced wing on each side, containing the offices, &c. A transept, surmounted with a painted figure of Belgium distributing wreaths of laurel, projects behind it, from which three naves open on each side, lighted like the transept from the roof, forming nine distinct *salons*. The external walls are divided by frames into compartments, covered with canvass, on which, in quiet grey tints, are painted arabesque ornaments; lance-heads for the cornice, on which float the flags of all nations, those of Belgium predominating. The interior is hung with dark maroon-coloured cloth. Assuredly nothing could be simpler than this temporary erection—nothing could be conceived of better taste, or more suitable to its objects. The building was erected in two months, at a cost of £1400, and the architect is M. Cluysenar, to whose taste is due the beautiful covered Gallerie St. Hubert, in Brussels.

The arrangement of the catalogue of the works exhibited is singularly defective. The artists' names are placed alphabetically, and their pictures numbered consecutively; No. 1 being M. Albema, of Dusseldorf; and No. 1479, M. Zwengauer, of Munich; but, in the gallery, the only order followed is that of the size or subject of the pictures; so that it is impossible to discover a given number except by searching the whole gallery through.

Louis Gallait, a Belgian artist, exhibits a large picture, "The Honours rendered after their decapitation to Counts D'Egmont and De Horn." The bodies are placed on a bier covered with black cloth, and the heads annexed, but evidently not adhering to the lifeless trunks. The members of the "Grand Serment," or Guild, are contemplating the bodies of the martyrs in dumb grief, and tears are on the cheeks of a few sturdy citizens. A Spanish soldier and a superior agent of the Duke D'Alba are witnesses of the scene in haughty disdain. This composition tells its own story in a touching and affecting manner, and the mutilated corpses have nothing repulsive to the spectator. The picture is carefully and correctly painted, and is much admired. It is said to have been purchased by the Government for £1200.

M. Gallait has also another picture here, No. 533, "Art and Liberty." A Bohemian peasant, holding a bow over his violin, appears waiting for an inspired theme.

Gustave Wappers, of Antwerp, has no picture here; but De Keyser has a fine painting, commanded by his Majesty—subject, "Elizabeth of Hungary distributing alms to the poor."

No. 223, by Cogniet, of Paris, "Tintoretto painting his Daughter after her death," was painted and exhibited upwards of twelve years ago. This picture possesses a melancholy and graceful reality.

M. Vanschendel has a remarkably clever and truthful "View of a Market-place at Rotterdam," under the combined effects of moonlight and candlelight, painted with the minute detail worthy of the ancient Flemish school. The limits of this notice will not permit a closer scrutiny of other excellent pictures, the criticisms on which will find a better place in the journals exclusively devoted to the fine arts.

B. B.

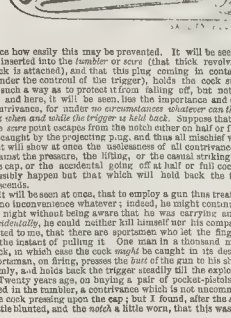
GUN ACCIDENTS, AND THEIR PREVENTION.

(To the Editor of the ILLUSTRATED LONDON NEWS.*)*

SIR,—As the shooting season has now commenced, will you allow me to make a few remarks on the dangers and disturbance of the gun employed in the usual way, and unprotected by any means for the prevention of accidents? Allow me to say, that I have nothing to do in the manufacture of guns, and am in no other way interested than in the cause of humanity. It is now three years since I published some letters on the present subject, since which time I have had the dismay to reckon upwards of *sixty* accidents, of such a kind as might, almost all, have been prevented by the simple and inexpensive means I propose.

When we reflect upon the number of guns in private hands, we shall not be surprised at the results. The introduction of the percussion lock was so sudden, and recommended by such advantages over the old plan, that it was immediately and unhesitatingly adopted by one and every one to that, it has been continued without any attempt having been made to lessen or do away the danger it introduced. I do not mean that safety locks of various constructions have not been invented, but none of these have yet come into use, because all demand too sportsman that he should learn and adopt some new mode of manipulation in the use of the gun. Old habits are inveterate; and whatever was promised in the way of security, has not been considered worth the trouble.

The statistics of gun accidents clearly show that nearly all happen by means of the *cock* or hammer of the lock, and not by the *trigger*, which is protected by its guard. The most common cause of accident are these. The cock, which rests upon the *cap* sustained by the *nipple*, is casually lifted, but not high enough to catch at the half-cock, and let descend upon the cap, which explodes: or while thus resting, the cock receives a blow, and the gun is accidentally discharged. Now there is a fact connected with these two kinds of casualty which is rarely taken into consideration, and but little known. It is this: the fulminating composition contained in the cap, having been pressed upon, as it is by the full force of the spring for any length of time, becomes so susceptible from its particles being brought into such close contact between the hammer and the anvil underneath, that the slightest blow will cause its explosion; hence a fertile source of accident and calamity. A reference to the accompanying diagram will show at



once how easily this may be prevented. It will be seen that a plug of soft iron is inserted into the *tumbler or sears* (that thick revolving plate to which the cock is attached), and that the spring acting in contact with the *sears point* (under the centroid of the trigger), holds the cock suspended over the cap, in such a way as to protect it from falling off, but not to touch or rest upon it; and here, it will be seen, is the simplicity and efficiency of this simple contrivance, for under *no circumstances whatever can the cock fall upon the cap but when and while the trigger is held back*. Suppose that by a full or heavy blow the *sears* point escapes from the notch either on half or full cock, it cannot fall to be caught by the projecting plug, and thus all mischief will be prevented! This fact will show at once the uselessness of all contrivances which do not provide against the primary cause, the striking of the cock down upon the cap, or the accidental going off at half or full cock, none no accident can possibly happen but that which will hold back the trigger while the cock descends.

It will be seen at once, that to employ a gun thus treated, puts the sportsman to no inconvenience whatever; indeed, he might continue its use from morning till night without being aware that he was carrying an instrument by which, *accidentally*, he could neither kill himself nor his companions. It has been objected to me, that there are sportsmen who let the finger slip from the trigger at the instant of pulling it. One man in a thousand may be addicted to this trick, in which case the cock *might* be caught in its descent; but nearly every sportsman, on firing, presses the *butt* of the gun to his shoulder, grasps the stock firmly, and holds back the trigger steadily till the explosion is complete.

Twenty years ago, on buying a pair of pocket-pistols, I had an extra notch filed in the tumbler, a contrivance which is not uncommon in order to prevent the cock pressing upon the cap; but I found, after the *sears* point had become a little blunted, and the notch a little worn, that this was not efficient. The plug is a new contrivance, and may be made to project far enough to insure the most perfect security: every construction of lock is susceptible of it, no difficulty or derangement takes place, and its introduction by most gunsmiths would be done at the cost of a shilling.

I am, Sir, your obedient servant,
E. V. RIPPINGILLS.

P.S.—Among last year's gun accidents are the following terrible calamities, all transpiring in the space of six weeks:—Lady Campbell, in Ireland, killed on the spot by the falling of a rifle. The hand of a son of the late Daniel O'Connell dreadfully shattered by the accidental discharge of one barrel of his gun, while loading the other. The only son of Col. Orde killed on the spot in attempting to draw a gun towards him, holding by the end of the barrel. A Mr. Streefield, in company with Lord Shelburne, lets his gun fall upon the floor, receives the charge in his heel, and dies in three days. The wife of a mechanic, at Birmingham, shot dead on the spot by the accidental discharge of a gun. Two brothers in Essex, the one killing the other by handing him the gun. A farmer, in Kent, killed in drawing his gun through a hedge, &c.

SHORT WHIST.

In cutting, the ace is lowest. In *cutting out*, the highest goes out, the stranger comes in. In *cutting for partners*, the two lowest play with the two highest, and *the lowest deals*. If two persons cut the same cards (two deuces or two queens, &c.), they cut again.

2. The dealer's partner *makes the cards*, and gives them to his right hand; the dealer shuffles them again (supposing two packs).

3. If we win before the adversaries have scored a point, it is a *treble game*; if they have one or two, a *double*; if three or four, a *single*. The game is five.

4. If we are at four we cannot *count honours*.

5. *The rubber* is the best of three games. The games are marked by fish, *pat up*, one for a single, two for a double, three, and two added for the rubber. Thus, two singles and a treble is a *rubber of one*, a double and two trebles a *rubber of six*, &c.

6. Pineessing is chiefly practised third hand. If I have first and third best, I finesse the third best (*i. e.* play the third best), for the chance of left hand not having the second best. Finesses are best in trumps, and when strong in trumps.

7. *Tenace*, the advantage of position, chiefly obtained, fourth hand. When I am fourth hand, if I have first and third (*e g* ace, queen), I make both.

8. To trump out a lead implies, to ruff, *i. e.* to trump.

9. Mark well the trump card; attend to the board; attend also to the scores; and, when playing for the odd trick, seldom finesse; play single cards; in short, play a forward game.

10. When I have many trumps, of course it is probable my adversaries have few; consequently, in this case I play a backward game in other suits as if they were trumps, for the adversaries not liking to be ruffed.

11. Return partner's lead immediately; first, when you win with ace and can return an honour (*eg*); secondly, when he has trumped out Obs. 9 or 10 is an equivocal lead, not absolutely to be returned; in general, your partner's lead may be returned at a future time.

12. Never play a 6 for a 5, or 7 for 6, &c.

13. Partner wins my winning card with best; he commands the suit: with second best; he has no more.

14. Endeavour at least to remember trumps and commanding cards.

15. When winning cards are between me and my adversaries, I play an obscure game: the colours they where partner has a good hand.

16 If partner refuses to trump a winning card against him, I play my best trump

17. When I am, or when my partner is, weak in trumps, I discard from my numerous suit, and keep guard on adversaries' suit. When I or partner strong in trumps, preserve the numerous or strong suits; in general, *discard* from partner's suit, but *keep a small one* to lead when trumps are out.

18. If you are in doubt about a trick, win it.

19. If you have a moderate hand, sacrifice it to your partner.

20. When a partner *discards* in his partner's lead, it is to show his strong suit.

21. I remain with 1st, 3d, and 4th trumps; I play the latter

22. How to establish a *long suit* —Ace, three trumps, and a long suit; I pass two rounds, but always win the 3rd round; ace, king, and two, with a long suit; pass one round, or lead a small, but win the 3rd round. Then your long suit forces out the best trump, if you have it not, and your 13th trump brings the long suit in again, and establishes it.

With ace, king, 4, the ace and king; with king, queen, 4, the king (supposing still a long suit); to ensure three rounds of trumps. This is difficult when left hand is very strong in trumps. When partner is strong in trumps he protects your long suit. When trumps are out, a commanding card will bring in your long suit, and therefore preserve one.

23. The 13th trump is very material. With ace, 4, and the 13th trump; pass the king and queen.

24. Lead through the strong suit and up to the weak.

25. Small card turned up, keep it till last, unless adversary leads trumps, and throw it away even before the dealer.

26. Be cautious about ruffing or over-ruffing when strong in trumps, unless your partner (a good player) visibly forces you; this caution is less necessary when you have no long suit, but even uncertain cards when weak in trumps.

27. Ruff your adversary's strong suit immediately

28. Force your partner, if he plays ill. Force your partner to obtain a saw, which is always desirable, and for this purpose lead the single card before forcing.

29 I force your partner when you suppose him weak in trumps, on these grounds. 1st. That you have discovered him strong in them; 2ndly. That he leads a single card (*vide* 40); 3rdly. That he ruffs and wins, and does not trump out.

30. Strong in trumps, *i. e.* honours and three, or one honour and four; but less than this shows you to force your partner.

31. Never force adversary but when he is strong in trumps.

32. If a good player refuses (to trump) he is probably strong in trumps, with one strong and another weaker suit, from which he throws away (*vide* 24)

33. Under-play. I have best and second best of left hand lead; I make one of them, and play a small in order—1st, that partner may make the third best; 2ndly, that I may command left hand's suit.

34. If your king makes, it does not follow that partner has ace.

35. Keep the commanding card of adversary's lead, never of partner's.

36. Odds 2 to 1 against your player having a card named. Odds 3 to 4 that he has one of two cards named (not in your own hand, of course).

37. When strong in trumps, inform your partner of it soon (*vide* 30)

38. Rules for a child.—Follow suit. Return partner's lead. Play lowest second hand, and highest third hand.

THE LEAD

39. Best lead from sequences of three or more, the highest; second best, from the most numerous suit.

40. With a few small trumps, a single card.

41. Better lead from a suit headed by king or queen than ace, and let your adversary lead the latter: in this case the ace will do them most harm

42 I have six trumps, I remain with four, the best in adversary's hand; I lead a small trump.

43. Trump out, *i. e.* lead trumps—first, with six trumps; secondly, when partner has a strong suit; thirdly, if adversaries play from weak suits; fourthly, if strong in other suits though weak in trumps.

44. When partner has no more trumps, lead trumps in order to take two or one. Lead *through* an honour in trumps or for the purpose of leading up. Partner turns up an honour, lead a small, if *strong*; if weak, your best. Queen turned up on right, lead king; knave turned up, lead queen.

45. I have last trump (and no partner) winning cards and a losing one—I lead the latter; if no winning cards, a trump.

46. Show your strong suits before you lead trumps

47. Generally speaking, lead trumps in trumps (or in other suits if strong in trumps), lead a small (*vide* 10). If weak in trumps, the ace.

48. Ace, king, and knave: the king, and stop. Your partner returns, and you finesse the knave. (This is reckoned old-fashioned, and in a numerous suit will not do.)

49. Ace queen, or ace knave, a small, except it is a numerous suit. But avoid this lead, for *tenace* gives you *tenace*, fourth hand. Ace ten is more likely to give *tenace* than ace nine; therefore prefer leading from the latter.

50. Ace, king, and three trumps, a small, that partner may make a trick.

51. King, queen, &c., in trumps (or if strong in trumps) a small; otherwise the king In a numerous suit not trumps, the king.

52. Lead 9 or 10 only when best of a weak suit of 3 or less: or from sequence to king: or 9, 10, king, knave.

RIGHT HAND LEADS: I AM SECOND HAND.

53. Ace and king. I win, and if strong in trumps continue.

54. Right hand wins and returns. I have best and 4 small: supposing he is player enough to have finessed, I pass it if strong in trumps

55 Ace, knave, and ten (*vide* 10). If weak in trumps, the ace.

56. Ace, queen, pass it unless he lead knave, then play ace.

57. Ace, king, 10; the 10.

58. Having led from king, &c., right hand has won with knave or 10, and returns; put on king, the only chance of making it

59 Never put on queen, knave, or 10, second hand

60. King, queen, ace of third and my partner's lead is strange, not if strong (*vide* 89).

PARTNER LEADS; I AM THIRD HAND.

61. If I win partner's lead with queen I don't return, except in trumps.

62 Partner leads ace and queen. I have king and two; I must win his queen.

63. Ace, knave, and one; the knave.

64 Partner leads 9 or 10; if I have ace I win it; if an honour and one, win it; if an honour and more or three small, pass (*vide* 92).

65. Partner leads a 8th card; it is to force the adversary (to trump,) therefore. I put on a high trump. [Keep a place in your hand for 13th cards.]

66. Sequence of 3 or more; the lowest.

LEFT HAND LEADS; I AM FOURTH HAND.

67. I win adversary's lead; I return, unless I have a very strong suit.

68. Left hand leads king; I have ace, knave; pass it.

69. Ace, queen, and two trumps; left hand leads knave; I pass it.

70. I have best and second best of left-hand lead. I make one, and play a small; in order, first, that partner may make third best; secondly, to command the lead. This is called *under-play* (*vide* 10) as to the backward left-hand game.

TO CORRESPONDENTS.

LEMA.—"Malher a Bos" is the motto of Dunne, of Brookfield.

A DESCENDANT.—*Arms* of Waldram: "Sa. a chev. between three suns arg. *Crest.* A jewsock a head ppr.

J. H.—Sir George Cockburn, G.C.B., 5, Clifford-street, Bond-street, London

T. S. Warwick.—The Godiva Procession was illustrated in our Journal in 1848, No 323

ROTATOR.—Apply to a dealer in second-hand books at Oxford

ONE WHO WISHES TO EMIGRATE.—See the "Canterbury Papers," published by Parker, 445, Strand.—L

R. b. i. "Gravesitor-place is thanked; but we have not room for the Illustration

A REGULAR SUBSCRIBER, Bristol.—The "Penny Cyclopædia"

HALIFAX should obtain the interest of a Director of the Company

FAGOT should apply to a professor of singing

A SUBSCRIBER.—The remedy would be Legacy

A REGULAR SUBSCRIBER, City.—Bayes are still considered game

T. B.—has been misinformed; Dr Lingard was born in 1817. See the "Memoir" in the ILLUSTRATED LONDON NEWS No 454

NORD, Buckingham.—Davidson's "Treatise on Short-hand"

X U V, Midhurst.—See the "Song of the Apple-tree," with Engraving, in No 466 of our Journal

J. R. Manchester.—The Portrait will appear shortly

A SUBSCRIBER, New Ross.—Prepared photogenic paper may be had at Knight's, Foster-lane, Cheapside

E. A. C. Brighton.—The Newell Lock is Mr Hobbs' invention

HOPE.—A small work upon the Exhibition has just been published

F. C. S., Atherstone.—"Blackie's Dictionary" is preferable

Perhaps in fact the Englishman in a recent adventure with some Mexican robbers was Mr S T Cliseold

H. W. Manchester.—We cannot enlighten you as to the Hungarian demonstration

H. C. E. Edinburgh.—Some of the Mexican Indians subsist entirely on vegetables, but drink no liquor to excess. See "Life in Mexico"

MELPOMENE Apply to any bacheller: we cannot give prices

A CONSTANT SUBSCRIBER, New Cross.—We cannot give any information as to the French letter

ARITHUS, Aberavon, and PLATINUM.—We cannot inform you

H. H. Tavistock.—Perhaps the *Penny Cyclopædia*

C. Macclesfield.—Address the post, care of Mr Moxon, Dover-street, Piccadilly

MONTREAL.—Apply to Mr Gilbert, Bookseller

J. S.—Apply to the doctor. Somerset House. See the "Fine Arts Almanac"

A SUBSCRIBER.—The word "chevisance" is spelled in the "Law Dictionary." Of a good account of the Cock-lane Ghost. See, also, a volume entitled "Signs before Death," Boswell's "Life of Johnson," &c.

YOUNG HEAD AND Colonial papers are filed at the Jerusalem Coffee-house, Cowper's-court, Cornhill; and at the North and South American Coffee-house, 59 and 60, Threadneedle-street. The Colonial Club no longer exists

AMOS, Cork.—There is nothing new in the filter plan

C. H. E. Lodge.—We shall be glad to see any sketches of events, &c

A SUBSCRIBER, Lonsdhaze.—Mr Cockbur was killed in a parachute descent, July 24, 1837. The Duke of Bedford ascended with Mr Green in his balloon voyage to Nassau Nov 7, 1836

W. C., Pittsburgh, is thanked; but we have not room for the sketches

W. L. R. Lymington, and H. T. Sheffield.—Declined

L. G. Chelsea.—Yours is a question for a patent agent

E. M. 31, Inverlah.—We have not room for the letter

HISTORIC PICTURES we have not room for

ANCIENT MARINER, Newington.—"Railway Economy" will inform you

J. C, Bolton-le-Moors.—The scene in question, in the large sheet of Sketches, is a portion of London Bridge

A G Marlborough College.—We have not room. The establishment has been more than once described in our Journal

E. T, Cambridge Wells.—The *President* steamer sailed from New York in March, 1841. Her fate to this day remains a melancholy mystery

A SUBSCRIBER.—Address "Mrs Hole care of Messrs Blackwood, Edinburgh"

W. C. T, Cumberland.—Brussels is accented on the first syllable

A. S. Clapton.—Any popular account of the Building will inform you

A REGULAR.—Apply to Mr Robertson, patent-agent, 166, Fleet-street

R. H. E, Worcester.—Thanks. We shall be glad to receive the print

N. N. F, Bombay, and A. R, Rye, are thanked; but we have not room for the illustrations

G. S, Birmingham.—We think not. For stereotyping, see Knight's "Dictionary of Printing"

H. B, Swansea.—See the "Taxidermist's Manual"

J. S.—The holder of the engraving will be entitled to the boundary engraver

M. A.—Apply to Mr Beard, photographer, King William-street, City

G. W, Epsom.—Apply to Miller, artists' colourman, Long-acre

MODEL LADY, Perthshire.—Certain hints is made by Jason, Rathbone-place, Oxford-street

C. Y.—See Crockley's Picture of London, new edition

W. M.—We have not room for the letter on the "Velasquez Portrait of Charles I."

H. H. C. Great Baddow.—See Cliffe's "Book of North Wales"

S. B. Everton, is thanked; we regret that we have not room for the Illustration

VERITAS The paragraph in question was copied from a daily journal

J. D. DE—We cannot undertake to give the recommendation

A W, Pytchley The two-page Engravings in our Journal are intended to be inserted by the reader as folding plates

PISCCA—We regret that we have not room

J. W, Ashton Court—We think not. For stereotyping, see Knight's "Dictionary of Printing"

ANT.—Photographic materials may be had of Horne and Co., 123, Newgate-street

W. H—Surenne's "Pronouncing French Dictionary." See "Etiquette of Courtship and Marriage"

J. P, City-road.—There is no such arrangement of "chemical constants" as you name

SARAH, Leeds: and A SEAMSTRESS, Dudley.—Received

W. N W, Hampstead-road We have not room

INQUIRER.—There is no legal mode of annulling the marriage contract but by divorce by act of Parliament. The plan suggested would be of no avail

J. P.—The arms of Partridge are "On a fesse cottised or, between three partridges rising of the last, as many torteaux. *Crest*. A partridge, as in the arms"

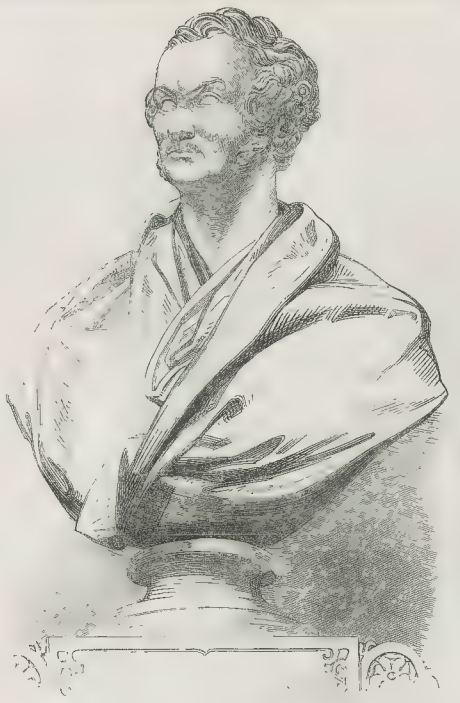
A CONSTANT READER.—Apply to Mr Robertson, 166, Fleet-street.

G. W. H.—In a hodden high treason and murder, a judge may pass sentence of death for certain cases, and when regard to homes having [illegible] murder under axe

MONUMENTAL BUST OF THE RIGHT HON. CHARLES BULLER.

It will be interesting to the many friends and admirers of the much lamented Charles Buller (says the *Examiner*), to know that a monument to his memory, subscribed for by the most eminent men in the State, of all opinions and parties, is now placed in the north transept of Westminster Abbey. It is a marble bust, with tablet and inscription. In the likeness (which otherwise is excellent) we miss something of the refinement of expression which we remember in life. Perhaps the features are a little too old and massive. But the sculptor has so happily caught (and, we understand, from posthumous records) the good-humour as well as intellect which distinguished the original, that the work must be regarded as a remarkable proof of the ability and taste of Mr. Weekes. It is placed immediately on the left of that fine specimen of the genius of his master, Chantrey—the statue of Francis Horner—commemorating a career as full of noble performance and noble promise, closed as prematurely, as deeply and widely deplored. The inscription on the tablet, recording with eloquent discrimination and feeling the characters and virtues of Charles Buller, is from the pen of his attached friend, Mr. Monckton Milnes :—

Here, amidst the memorials of maturer greatness, this tribute of private affection and public honour records the talents, virtues, and early death of the Right Hon. Charles Buller; who, as an independent member of Parliament, and in the discharge of important offices of state, united the deepest human sympathies with wide and philosophic views of government and mankind, and pursued the noblest political and social objects, above party spirit and without an enemy. His character was distinguished by sincerity and resolution, his mind by vivacity and clearness of comprehension; while the vigour of expression and singular wit, that made him eminent in debate and delightful in society, were tempered by a most gentle and generous disposition, earnest in friendship and benevolent to all. The British Colonies will not forget the statesman who so well appreciated their desires and their destinies; and his country, in recalling what he was, deplores the vanished hope of all he might have become. He was born August —, 1806. He died November 29, 1848.



MONUMENTAL BUST OF THE RIGHT HON. THE LATE CHARLES BULLER, IN WESTMINSTER ABBEY.

MONUMENT TO THE LATE JOHN BROOKS, ESQ., AT MANCHESTER.

NEW CONTRIBUTIONS FROM SWEDEN AND NORWAY IN THE GREAT EXHIBITION.

Just when we thought we had concluded our general bird's-eye view of the Crystal Palace, the King of Sweden and Norway sent in a cargo of miscellaneous contributions, which fill up, and more than fill up, the blanks to which we referred in a previous article. The carriole has not arrived, but the sledge is there in the shape of a sober comfortable thoroughly business-like looking vehicle, less luxuriously elegant than the Canadian sledges, more solid and business-like than the racing affairs from Russia. Rather square in outline, painted dark rosewood, lined with blue cloth, with robe trimmed with the fur of one of those Norwegian bears that Mr. Lloyd used to take such pleasure in pursuing. It is a carriage in which, after a month's hard frost and snow, a respectable couple might take a drive without exciting any very particular attention. With the sledge have come two other vehicles, a gig and posting chariot, mounted on circular springs, for which the inventor claims advantages which could only be explained by a diagram. Following the example of Prussia and Spain, Sweden displays a huge cannon, with a novel contrivance for loading at the breech. This formidable instrument is placed in the avenue close to a gigantesque graceful egg-shaped urn of highly-polished red mottled granite, which would appear, so bold and regular are the curves, to have been cut out by machinery. The Swedes connected with the Exhibition are sanguine that this granite will become an article of commerce.

Among the articles for domiestic use we must especially note two compact and economical cooking stoves, in which wood, charcoal, or peat may be used; a machine for heating flat irons, without contact with fire, which can stand on a table. This is very ingenious, and, on a smaller scale, to the many sensible ladies who themselves iron their fine things, would be invaluable. But the most generally useful article is a window sash, exhibited by Major Rosenhild, of Christiansand, Norway, which, without lines or weights, can instantaneously be moved up and down, or fixed from withinside, while, from the outside, it is impossible to move it. The invention consists in a "spring fitted into the stile of the sash." The free end of the spring fits into a catch formed in the window-frame, by which the sash is immovably fixed until the projecting piece is pressed or lifted on to the catch, for which purpose the end of the spring projects a small distance beyond the surface. By applying the finger to this projection, the sash-frame can be moved either up or down, as may be required.

Some soapstone pans, which would be useful in boiling preserves or acids of any kind, to which we alluded in our notes on the United States, are exhibited by Sweden, and can be sold at a very cheap rate—about 1s. 3d. each. Indeed, the exhibitors claim the merit of cheapness for almost all the articles shown in this department; for instance, muffs and tippets of gray squirrel-skin are marked at very moderate prices, although the higher class of furs are dearer in northern countries than in England.

Among the articles of luxury deserving attention are a carved wood picture-frame; rosewood tables, inlaid in silver; a chandelier of metal, with glass pendents, richly gilt; and a magnificent tankard of silver, fashioned after the pattern of a slice of the trunk of a tree, the handle formed by two gnarled twining arms. This is worthy to have been the drinking-cup of one of the strong-armed Berserkers, or fierce Scandinavian Sea-Kings.

Some of raw produce, fine samples of virgin silver and copper, and specimens of pearls, are very nicely arranged.

It is to be regretted that these contributions, which have given so much more importance to the department of Sweden and Norway, did not arrive earlier.

NEW CHURCH OF ST. JOHN, KENILWORTH.

On the 19th instant the village of Kenilworth presented an unusually animated appearance, on the occasion of laying the foundation-stone of this new Church. The clergy of the neighbouring districts, many of the inhabitants, and several well-dressed visitors, assembled in the old parish church, at eleven o'clock, when a sermon was preached by the Venerable J. Sandford, B.D., Archdeacon of Coventry. Upon the termination of the service, a procession to the site of the new Church was formed. The Abbey-street and the whole line of road to the site of the new Church, at the end of the village, towards Warwick, was more or less adorned with banners, flowers, and evergreens. The entrance to the site was also adorned with banners and flowers; and a raised platform for the visitors, the school children, &c., was graced at the back with a banner, on which the crown was emblazoned, with a loyal motto. Stretched out over the front of this platform, and near the foundation-stone, was a white streamer, with the words "Mine eyes shall be open, and mine ears attend to the prayer that is made in this place." About half-past one o'clock, the procession reached the ground. The service commenced with the singing of a hymn, "Great is the Lord our God." The officiating minister, the Rev. E. E. Wilmot, then read selections from the Scriptures, appropriate to the occasion. After the minister had recited two collects, the auditory and children sang the 127th Psalm with good effect. The leaden box, containing the scroll of parchment, was then deposited in a cavity beneath the stone, and the silver trowel being presented to Lord Leigh by C. J. Wheeler, Esq., his Lordship laid the stone, saying: "In the faith of Jesus Christ, and in the memory of St. John the Evangelist, we place this stone in the name of Jehovah, God the Father, God the Son, and God the Holy Ghost." The Rev. G. S. Bull, of Birmingham, then ascended the stone, and delivered an extemporaneous address, characterised by much feeling and eloquence.

NEW CHURCH OF ST. JOHN, AT KENILWORTH.

At the conclusion of the reverend gentleman's address, the assembly sang a hymn :" Lord, in this dark and stormy day."

The Rev. E. E. Wilmot then repeated some prayers, after which the National Anthem was sung by those assembled.

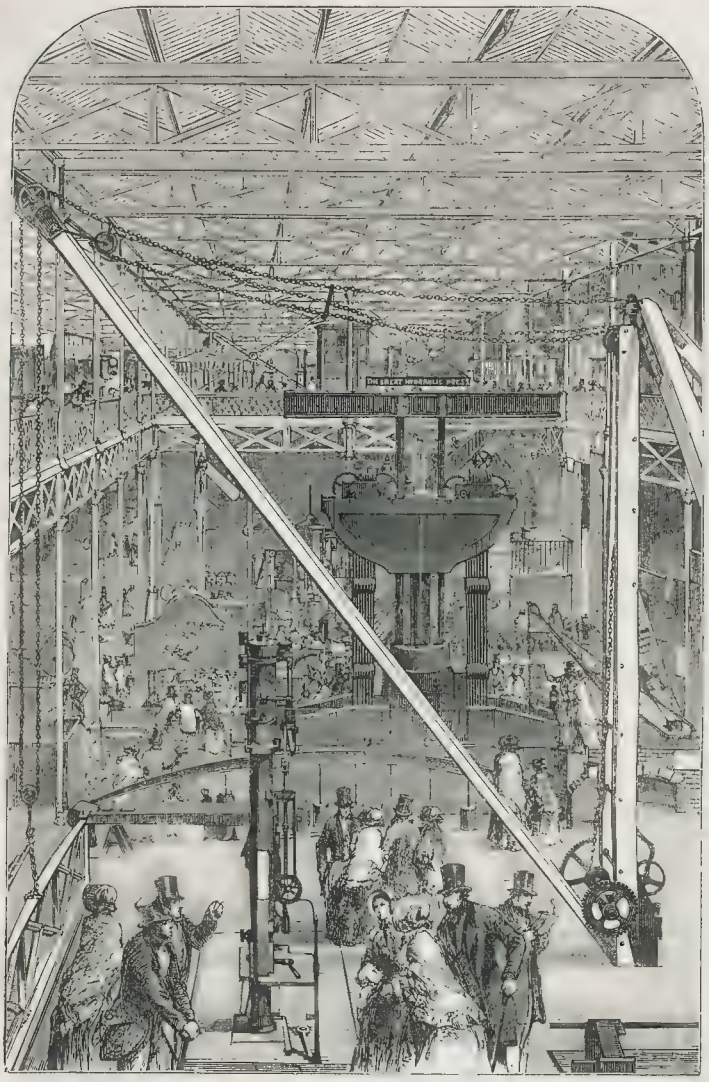
Mr. Boddington, surgeon, then mounted the stone, and asked for three cheers for Lord Leigh, which were given heartily. His Lordship briefly returned thanks, assuring the assembly how gladly he assisted, in his humble way, in promoting the work laudably set on foot by the Rev. Mr. Wilmot, to whose zeal and industry the parish was in the main indebted for the new edifice they were about to raise. His Lordship concluded by calling for three cheers for their worthy vicar. These being given, Mr. Wilmot returned thanks, and the procession again formed, and proceeded to the King's Arms, opposite to which it stopped, and after singing a hymns separated Some old people were regaled with tea and cake on the ground, and the school children were similarly entertained on the grounds adjoining the residence of the vicar.

The site of the new Church abuts on the Leamington Railway on one side, and faces the Warwick coach-road on the other. It is about an acre in extent, and affords space for a parsonage, which is to be built on one side of the Church, and a school, which is to be erected on the other. The cost of the land is £350. The Church is to be built in the early English style, with a tower and spire, at a cost of £3,000, exclusive of the site and the architect's percentage. It is to contain seats for 600, of which 400 are to be free. A collection was made on the ground, which amounted to £96.

MONUMENT TO JOHN BROOKS, AT MANCHESTER.

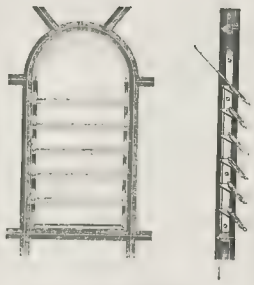
This fine memorial to one of the great leaders of the Anti-Corn Law movement has recently been erected at Manchester. It is made entirely of Sicilian marble, and is adorned on its sides with symbolic statues, placed in niches, of Fortitude, Charity, Commerce, &c.; and in the pilasters and spandrils with floral emblems of the cotton and flax plants, poppies, roses, oak, laurel, and other branches, all bearing, in their attributes, relation to the figure above and around which they are placed, and illustrative of the commercial and domestic character of the dead. In its general character this monument is particularly graceful, and is more worthy of note from its being of novel, yet, at the same time, highly pleasing outline and decoration. It is from the studio of Mr. John Thomas, architect and sculptor, Paddington.

THE GREAT EXHIBITION.



MACHINERY COURT

DESIGN WOVEN IN SILK BY HOULDSWORTH AND CO



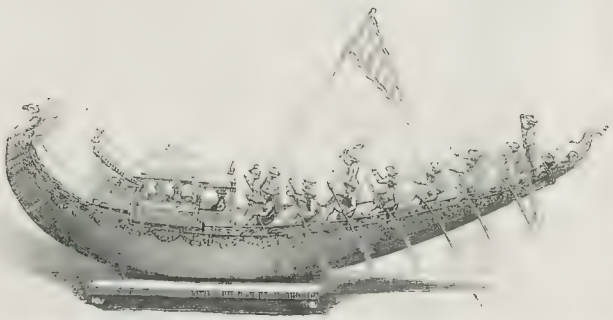
MOORE'S LOUVRE VENTILATOR

DESIGN WOVEN IN SILK, BY HOULDSWORTH AND CO.

This and the opposite page contain two different representations of parts of the Exhibition Building; one, the Machinery Court, with Fairbairn's crane, and the famous patent hydraulic press which was used in raising the tubes of the Britannia Bridge; the other a part of the Foreign Nave, in the French department, with Matifat's large cast-iron vase in the foreground, and various articles of coarse grey pottery in the rear

Messrs. Houldsworth and Co., of Manchester, exhibit several most beautiful specimens of patent machine embroideries, consisting of quilts, table-covers, panels, &c., which are equal to anything of the kind ever done before in this or any other country, and are admirably adapted for decorative purposes. We engrave two of them, which are both from designs by Laugher, Dwyer, and Co. That on the top of the page is one of seven designs illustrative of the seven acts of mercy; the other represents, in child's sport, the ups and downs of life.

Moore's patent Louvre Ventilator is a very simple and efficacious contrivance, adapted for every form of window.



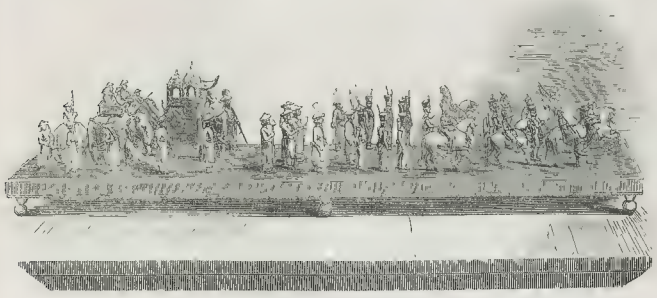
MODEL OF AN INDIAN BARGE.—EAST INDIAN DEPARTMENT

ALPINE PLANT PICTURE.—BY E. F. HECKEL, OF MANNHEIM.

THE GREAT EXHIBITION.

BAY OF THE FRENCH DEPARTMENT.

MODELS.—EAST INDIAN DEPARTMENT.



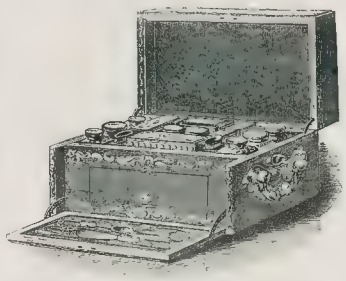
IVORY CARVING.—EAST INDIAN DEPARTMENT.

Several Pictures composed of Alpine Plants, exhibited in the Zollverein department, are fanciful compositions, in a style well adapted for the decoration of albums. The flowers present great variety of hue, and are combined with great taste.

PIANOFORTE.—BY PAPE, OF PARIS AND LONDON.

The Pianoforte by Mr. Pape, is one of his clever inventions. In its general appearance it resembles a loo-table, the top lifting up in sections, and displaying the keys, sounding-board, &c. There are remarkable designs amongst Mr. Pape's contributions, all possessing great claims to notice.

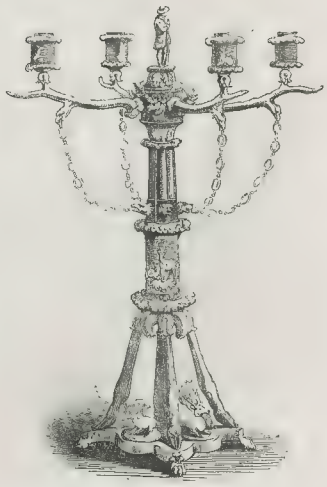
The various Models figuring in the East India department are extremely interesting, as exhibiting the costume and trades of almost every cast of the native population. We engrave two groups of these, one of which appears to be a procession, in which native and British troops are combined; a third Engraving represents a model of an Indian barge, with a native crew rowing her.



DRESSING-CASE.—BY C. ASPNEY, OF BOND-STREET.

This is, indeed, a splendid piece of workmanship. The dressing-case, intended for a lady's use, is manufactured out of a choice specimen of rare wood, most elaborately carved with devices illustrative of Neptune's attributes, in ormolu, richly covered and gilt. The interior arrangements are of an equally magnificent character; the stoppers of the various bottles, which are of silver gilt, bearing the name "Annie"—the lady for whom this elegant production was manufactured.

The horn candlestick from Hamburg is a pleasing specimen of a style of ornamentation peculiar to the hunting districts of Northern Germany.



HORN CANDLESTICK.—BY HAMPENDAHL, OF HAMBURG.

NEW GRAMMAR SCHOOL, IPSWICH.

THE NEW GRAMMAR-SCHOOL AT IPSWICH.

THE foundation-stone of this handsome edifice was laid by his Royal Highness Prince Albert, at Ipswich, on July 3 last, and the interesting proceedings were duly reported in our Journal of July 12.

The Ipswich School was originally founded by Royal charter; so that the laying of the first stone of this re-edification of the School-house was a well-graced compliment to the institution.

We gather, from Clarke's "History of Ipswich," that the existence of a grammar-school at Ipswich appears in the records of a great court held in the reign of Edward IV. In 1482, Richard Felaw, portman, who had been eight times bailiff of Ipswich, twice returned member of Parliament for Ipswich, made over his house and lands at Whitton for the maintenance of the master of the school, a gift still called after the name of the donor. In 1525, or the following year, Cardinal Wolsey, having founded Christchurch, at Oxford, commenced building a tributary establishment at Ipswich, upon a scale equal to that of the public schools at Eton and Winchester. At his request, Felaw's gift was alienated, and the old Grammar-School was merged into the new foundation. At the fall of Wolsey, however, his flourishing school also fell under the displeasure of his imperious master, when it was discontinued. The King then granted a new charter for the re-establishment of the old school: and the deed was enlarged and confirmed in a subsequent charter by Queen Elizabeth. The institution has since maintained its ground, and has of late years greatly increased in educational importance, under the present head-master, the Rev. J. S. Eigaud, M.A.

The corporation of Ipswich, being alive to the great advantages to be derived from this Royal foundation, determined to erect a more capacious and convenient establishment. In this object they have been assisted by some public-spirited individuals, and the result has been the commencement of the new edifice under the auspicious circumstances we have already detailed.

The site of the new School is at a short distance from the town, looking over the Arboretum and Christchurch Park on the east, and commanding an extensive view of the beautiful river Orwell and the rich valley of the Gipping on the south and west. The building, of which we have engraved the principal portion, will have a collegiate aspect, in the Tudor style, having a frontage of 168 feet, and a depth, on the south, of 110 feet. The front elevation, with its projecting porch, its gables, pinnacles, and parapets, is a picturesque composition. The porch of the main entrance will be a reproduction of the celebrated "Wolsey's Gateway," the most minute details of which will be adhered to; and the entire building, of red brick and dark mortar, will be in strict accordance with the olden structure. At the several external angles octagonal buttresses rise above the springing of the gables and ornamented parapets, and terminate in pinnacles. A tower, 70 feet high, crowns the entrance-hall. This apartment is 16 feet square, and above it are the infirmary and the convalescent-rooms. The corridors and staircases are spacious. The school-room is 62 feet by 31 feet, and 20 feet high to the springing of the open-timbered roof. The dining-room, senior and junior class-rooms, and library, are proportionally spacious. The dormitories are 12 feet high. Lavatories, baths, and good drainage are amply provided. The play-ground comprises 6½ acres. The section of the building appropriated to the use of the head master includes convenient apartments for the under-masters. Great care has been bestowed upon the plans; and Mr. Fisury, the architect, has generously relinquished, for the benefit of the institution, all remuneration whatever for his professional services. To conclude, the building and its provisions are planned throughout in that liberal and enlightened spirit by which the inhabitants of Ipswich are uniformly characterised.

FLOGGING IN THE ARMY.—In a report made to the Secretary at War, by Lieutenant-Colonel Jebb, the Inspector-General of Military Prisons, which has just been printed in a Parliamentary paper, the subject of flogging in the army is brought forward. It seems that imprisonment, in lieu of corporal punishment, has been beneficial in its operation, notwithstanding the contrary opinion of a number of military officers. Colonel Jebb states—"If the views of the more experienced officers in her Majesty's service as to the deterring influence of corporal punishment were correct, a great increase of crime in the army might have been anticipated, as the necessary consequences of limiting the power of courts-martial, and materially diminishing a mode of punishment deemed to be the most efficacious for the maintenance of discipline. It is, however, satisfactory to see that the result has not been unfavourable; and though it may partly be attributed to the encouragement given to good conduct, the better class of men who have entered into the service, and the partial discharge of some of the worst characters, yet, taking all this into account, I think experience has sufficiently shown that imprisonment for military offences has answered the expectations that were formed of it." In 1845, the year previous to the establishment of prisons, the number of convictions by courts-martial was 9984, and 693 corporal punishments were inflicted. In 1850 the convictions were 9306 and the corporal punishments 238. The effective force was about the same in each year—in 1845, 125,252; and in 1850, 125,119. Last year 495 lashes were inflicted, and in the preceding year 850, by the visitors of the prisons, for serious offences.

TORTOISESHELL TOM CAT.

A TORTOISESHELL Tom Cat, and a Queen Anne's farthing appear in popular estimation to enjoy a corresponding rarity. The coin is scarce, and so is the cat; but neither is so rare as traditional tale would have us believe, and this hardly allows existence.

The tortoiseshell is one of the most noted of the varieties of the domestic cat. The tortoiseshell-like marks are ascribed to a cross-breed of black and yellow. Males, as we have said, are scarce; and every year a specimen or two are offered for sale to the Zoological Society, as rarities worthy of place in their fine menagerie.

The specimen here engraved is a beautiful creature, and handsomely marked. It is fifteen months old, and is the property of Mr. John Thurston, of Walsham-le-Willows, in Suffolk, who, in this age of the Exhibition, is about to add his "Tortoiseshell Tom" to the sights of the day.

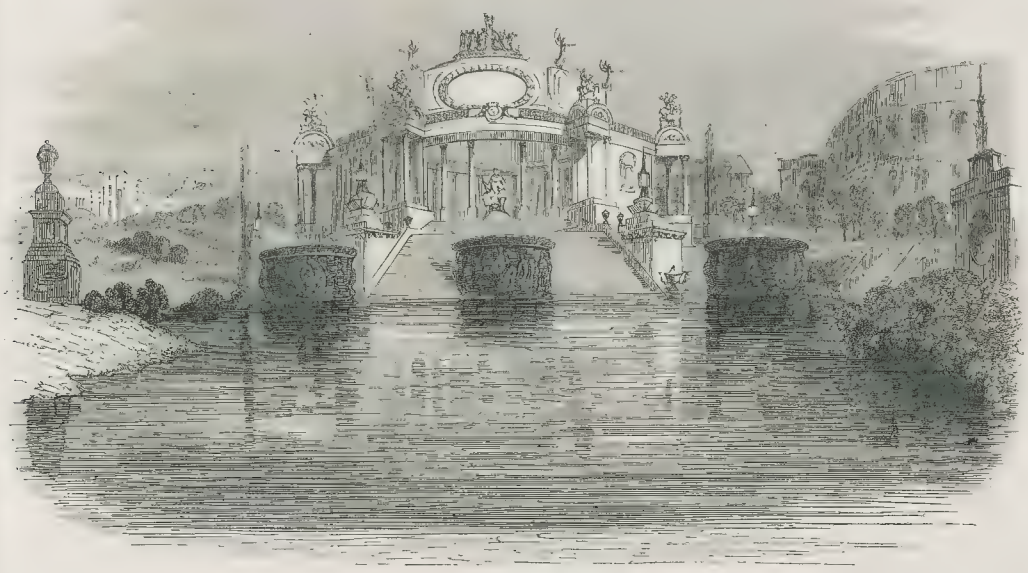
"TORTOISESHELL TOM CAT."

PLATE PRESENTED TO CAPTAIN WILLCOX, R.N.

THIS piece of handsome plate has recently been presented (with the addition of a silver tea service), by the principal merchants of China, to Captain James Willcox, of her Majesty's steamer *Fury*, who, in conjunction with Captain Dalrymple Hay, of her Majesty's brig *Columbine*, and Mr. G. J. Ribbett, of the Hon. East India Company's steamer *Phlegethon*, was instrumental in destroying the pirates in the China seas.

PLATE PRESENTED TO CAPTAIN WILLCOX, R.N.

The design is elegant and characteristic, and has been beautifully executed in silver by Messrs. Hunt and Roskell. It consists of a nautical column, supporting upon oak branches an epergne glass dish; the pedestal is borne by three hippocampi, and upon it is a British sailor hoisting his national flag, whilst a Chinaman kneels in gratitude at his feet.



"THE TEMPLE OF JANUS," AT THE SURREY ZOOLOGICAL GARDENS.

SURREY ZOOLOGICAL GARDENS.

The picture model at this favourite resort is, this year, an effective group of interesting edifices from old Rome, in the centre of which the Temple of Janus is the most prominent feature, the lake being made to play the part of the Tiber. We will not be too hard upon the antiquarian accuracy of the picture; be that as it may, the scene is cleverly effective by day, but is seen to greatest advantage as the framework of the pyrotechnic display at night, when the splendour of the *feu d'artifice* reminds one of the famed Temple of Concord at the Peace Commemoration in the Green Park, in 1814. It is certainly one of the most elegant exhibitions of the kind we have witnessed for a long time.

THE SERPENTINE, IN HYDE-PARK.

The attraction of the Great Exhibition has extended to the Serpentine, which, by the way, it was, at one time, intended to inclose for subaqueous experiments, in connexion with the wonders of the Crystal Palace.

The model frigate we have already spoken of, and in the accompanying Picture we see it surrounded with pleasure-boats, which, with a ferry, invest this fine piece of water with new life. The fashionable drive, on the north bank, is also shown in the View, and, with the flag hoisted upon the boat-house of the Royal Humane Society, denote the gay scene to have been sketched during the full tide of the past season.

THE FERRY AT THE SERPENTINE, HYDE-PARK.

HARDWICKE HALL, DERBYSHIRE

HARDWICKE HALL.—THE FLOWER-GARDEN.

THIS magnificent mansion, the property of his Grace the Duke of Devonshire, was visited by the members of the British Archæological Association, during their recent congress, held at Derby.

Hardwicke is situated between Chesterfield and Mansfield. The approach to the mansion by a noble avenue is thus described by one of the excursionists:—

"The drive from Baleover to this residence of the Duke of Devonshire is very beautiful. The park is ornamented with very fine oaks, under which numerous herds of deer were to be seen quietly grazing. The present building was erected by the Countess of Shrewsbury about 1590. She was the celebrated Elizabeth Hardwicke, and married no less than four times. Her first husband was Mr. Bailey, through whom she acquired property; her second a Cavendish, from whom the present Duke of Devonshire is descended. She then married a Sir William St. Lowe, and afterwards the Earl of Shrewsbury, the keeper for so many years of Mary Queen of Scots, from whom she obtained a separation. Mr. Hardwicke's house, or Old Hardwicke Hall, almost touches the present stately building. Everything in it and about it bears the impress of the proud, determined woman, who considered her father's house not a sufficient mansion for a Countess of Shrewsbury to receive Royalty in, and, consequently, erected the present edifice almost at its gate. Wherever you turn you are reminded of her. Her initials stand out in bold relief against the sky, outside the building, on the parapet, at every corner, and from canvass in the different rooms. This indefatigable lady built Chatsworth, Hardwicke, and another place in the county of Derby. The legend runs, that it was foretold to her, that as long as she kept building, so long would her life be—a ruse, probably, of the Barry or Smirke of the day to lead her on. In accordance with this, she kept building house after house, and at last died in a hard frost when the masons could not work. On entering the hall, the first striking object is a statue at the upper end, of Mary Queen of Scots, bearing the following simple but touching inscription:—

Maria, Scotorum Regina, nata 1542;
A suis in exilium acta, 1568;
Ab hospit neci data, 1587.

Tradition asserts that this was one of the seats in Derbyshire she visited, and her bed and room are shown, with her arms as Queen of Scotland and Dowager of France over the door, and her initials worked in the tapestry. The grand room in the building is the immense picture gallery, which extends the whole length of the house. In it are pictures of the Cavendishes; of the Kings and Queens of England, from Henry IV. downwards; the Court of Charles II., including all the beauties immortalised by Sir Peter Lely; philosophers, and others. The finest picture is a portrait of Thomas Hobbes, dated 1676. At the upper end of the room is a full length of Queen Elizabeth, in all the elaboration of the court dress of the time, with the high-standing ruff, the waist exactly in the middle of the body, the wide hoop, and the embroidered petticoats; and at the other, an excellent equestrian portrait of the first Duke of Devonshire. The presence chamber is also a noble room: the lower part of the sides of it are adorned with tapestry, and the upper with 'pargetting,' that is, figures in relief on plaster, and coloured. At the upper end is the canopy of state and other very curious worked velvet chairs. But, perhaps, the most interesting article of furniture in the apartment was an old music-table, round which many a madrigal and glee must have been sung. It was covered in mosaic-work with representations of music-books and musical instruments; in fact, so particular was the artist, that he had chronicled the notes on the open leaves of the wooden books. It was a table at which an amateur singer might almost gain inspiration. The tapestry in all the rooms was very fine, and seemed to have exhausted for a subject both scriptural and heathen mythology. Some of the oldest pieces were the covers of the seats and pulpit of a small chapel, which is asserted to have been used by Mary."

ELIZABETHAN GATEWAY.

The approach to Hardwicke by the avenue is universally lauded by tourists. The park, with its hundreds of deer and its wide-spreading oaks, the silver stream with its wooded margin, and the fair greensward, with the Hall itself in the distance, complete a landscape such as can rarely be enjoyed except in England.

The first appearance of Hardwicke is very imposing, more especially of the old portion as approached from the west. It is seen standing in connexion with the new house, on the very crest of one of the highest and boldest ridges of the new red sandstone, overlooking a beautiful valley, and commanding an extent of country on every side which is seldom equalled in beauty. From the state-room of the new, and from the dilapidated one of the old, can be distinctly traced out some of the loftiest eminences of the High and Low Peak, Barrel Edge, and the Black Rocks, near Matlock, Middleton, and Tansley Moors, Stubbing Edge, and the great English Appennines, stretching far to the north, appear in view, with a rich and beautiful country intervening. The mansion is a lofty oblong structure of stone, of Elizabeth's time, and possesses tall square towers at each of its corners. From the avenue, the front of the mansion looks dull and cheerless; but when the gate opening upon the handsome flower-garden has been passed, this portion of the Hall changes its appearance considerably for the better.

PART OF THE OLD MANSION.

GENERAL POST-OFFICE.—It having been ascertained that the correspondence for Lombardy can be transmitted by way of France more expeditiously than *vid* Belgium and Prussia, the regulation recently laid down for sending by the latter route, unless otherwise directed, all letters and newspapers addressed to Austria, will not apply to the correspondence for Lombardy. All letters, &c., for Lombardy will be transmitted as formerly, *vid* France, unless specially addressed to be sent by any other route, and will be chargeable with postage as follows: Under ¼ ounce; British, 5d.; foreign, 1s.: total, 1s. 5d. ¼ ounce and not exceeding ½ ounce: British, 10d.; foreign, 2s.: total, 2s. 5d. Exceeding ½ ounce and under ¾ ounce: British, 10d.; foreign, 3s.: total, 3s. 10d. ¾ ounce and not exceeding 1 ounce: British, 10d.; foreign, 4s.: total, 4s. 10d. Exceeding 1 ounce and under 1½ ounce: British, 1s. 8d.; foreign, 5s.: total, 6s. 8d. These letters may be forwarded either paid or unpaid, at the option of the sender, but payment for a portion of the distance is not permitted.

MANAGEMENT OF THE WOODS AND FORESTS.—On the 20th of next month, the new act, alluded to by her Majesty on the prorogation of Parliament, for the better management of the Woods and Forests, will come into force. The object of the new law is to separate the management of the Woods and Forests from the direction of her Majesty's Works and Public Buildings, and to make better provision for the management of the same. From the commencement of the act, the First Commissioner of the Woods, &c. is to be the First Commissioner of the Public Works and Buildings, with a salary not exceeding £2000 a year, and he may be a member of the House of Commons. The other Commissioners of the Woods and Forests are to continue to hold their offices, and their salaries are to be provided for by Parliament, but they are not eligible to a seat in the House of Commons. the other officers are to continue in their situations. Officers may be appointed to assist in the Public Works and Buildings. The management of all the Royal parks is to vest in the Commissioner of Works, and not, as heretofore, in the Commissioners of the Woods and Forests. Parliament will also have to provide for the expenses relating to the department of the Public Works, as well as in the management of the Woods and Forests, which latter department was paid out of the revenues of the Crown possessions. After the commencement of the act the First Commissioner of Public Works is to be an Exchequer Commissioner, a Commissioner of Greenwich Hospital, and a Commissioner for carrying into execution the acts relating to Highland Roads and Bridges, a Commissioner for Building New Churches, and the President of the Board of Health.

London: Printed and Published at the Office, 198, Strand, in the Parish of St. Clement Danes, in the County of Middlesex, by WILLIAM LITTLE, 198, Strand, aforesaid.—SATURDAY, SEPTEMBER 20, 1851. SECOND SUPPLEMENT.—GRATIS.

THE ILLUSTRATED LONDON NEWS.

No. 519.—VOL. XIX.] FOR THE WEEK ENDING SATURDAY, SEPTEMBER 27, 1851. [SIXPENCE.

THE FRENCH PRESIDENT AND HIS POLICY.

WHENEVER the fortunes of the actual President of the French Republic seem more than usually favourable, whenever his opponents increase his chances by their blunders, or he himself elicits from the crowds of Paris or the provinces any new proof of the immense popularity of the name which he inherits, rumours of an approaching *coup d'état* are industriously spread in the newspapers. The people give credence to them, and a score of factions await the event, which some approve, and which others condemn, but which all appear to look upon as very natural.

At the present time such rumours are even more than usually prevalent. The day for the solution of a very considerable difficulty is drawing near; the rival claimants for a Royal or Imperial throne, or for the simpler Presidential chair, are rendering by their folly or perverseness their own pretensions less and less likely to prove acceptable to any considerable classes of the people; while M. Louis Napoleon Bonaparte, calm amid the turmoil around him, and strong in his name no less than in his position and character, is seen by the great bulk of the community to offer by far a greater amount of securities for a firm and permanent Government than any candidate for, or pretender to, the chieftainship of the State. Hence the rumours that are current. The French are an impatient people. They are always for plucking the fruit before it is ripe. They are always for anticipating the natural progress of events; and they cannot see why the President should not take advantage of his good opportunities, and cut the knot which neither he nor any one else can well disentangle, and so make an end of it.

THE LATE GENERAL LOPEZ.—(SEE NEXT PAGE.)

But the President has more patience than the people around him, or than the nation at large, and will not, we may be certain, attempt to justify and realize the rumours that are so continually spread. Such rumours are flattering to his power and to his importance, and tend, as long as he lends them no countenance, to strengthen his position. His policy is to watch and wait, and to do nothing. Why should he act? Are not his opponents his very good friends? Does not the Legitimist party daily proclaim by its words and deeds that the restoration of the ancient Monarchy could settle nothing? Does not the candidateship of the Prince de Joinville—a man once popular because he wrote a stupid pamphlet against England, and masqueraded himself as a gallant sailor—prove treachery to the institutions under which he would be elected? And does not every other possible candidate except Louis Napoleon seriously alarm the trading and industrious classes in every part of France? Louis Napoleon may be, as he is called, a *pis aller*; but there is no other man in France whose position, antecedents, character, and pretensions would entitle him even to so questionable a designation. He may not be all that is desired, but there is no other to be compared with him; and he has nothing to do but to keep quiet—and to win.

The French are just now in a very peculiar temper, and with all earnestness repeat the words about liberty which their great poet once made use of in jest:—

> De son arbre civique
> Que nous est-il resté?
> Un bâton despotique—
> Sceptre sans majesté
> Fi de la Liberté!
> A bas la Liberté!

They are weary of liberty. Like Wordsworth, in his sonnet,

THE PRESIDENT LAYING THE FOUNDATION-STONE OF THE CENTRAL MARKETS AT PARIS.—(SEE NEXT PAGE.)

they deem it "a pastime to be bound," because, like him, "they have felt the weight of too much" of it; and all that they desire is peace. If, in addition to their general support of the Government of Louis Napoleon, any proof were needed of the fact, that the words "liberty, equality, and fraternity" have ceased to charm them, and that "order" is their present watchword, if not their idol, it might be found in the extreme alacrity with which juries condemn offences of the press. The Government is not nearly so willing to suppress freedom of discussion in the newspapers, as the stolid citizens who serve upon juries are to lend their aid in rendering the press a farce. The juries would stretch the law to punish journalists for expressions and opinions which we in England would think perfectly harmless; as the Hugo family, within the last few months, might abundantly and sorrowfully bear witness. The President of the Republic, who must know something of English manners, feelings, and politics, and who must be aware of the necessity and advantage of a free, fearless, and intelligent press as an aid to rational and constitutional government in this country, can scarcely be supposed to have any real enmity against the press of Paris; but his Ministry is forced by the state of parties, and by the temper of the shopkeepers—for, after all, France is, *par excellence*, the country of the *boutiquiers*—to treat the press with severity, because its discussions tend to alarm that respectable class who care more for security for person and property, and a tolerably full till, than for all the precensions of all the pretenders in the world, and for all the finest theories of political perfection that ever were broached. It is among the members of this class that the continual rumours of a *coup d'état* find such ready credence. Any sharp, short, decisive blow, that would give them a Government likely to last, would meet with their approval; and the greater the difficulties and obstructions that await a more peaceable and decorous termination of the present tantalising uncertainty of public affairs, the more the interests and demands itself to their impatient and imprudent sympathies. But this is not the game for the President to play. The great force at his command is that of inertia. The less he does, the more he will accomplish. He seems to be fully aware of the policy which is most suitable to his circumstances; and it is fortunate for him as an individual, that he is of a cooler temperament than the people who have chosen him, and that the real interests of France find no better, or even half so good a representative as himself. All other elements suggest instability. He alone suggests what the French so imperatively require, and what they would sacrifice even liberty to obtain—repose and order.

THE NEW CENTRAL MARKETS OF PARIS.

THE interesting ceremony, or rather spectacle, of laying the foundation-stone of the Central Markets of Paris (*les halles centrales*) took place on Monday, the 15th, in the presence of a vast multitude. The ground on which the new buildings are to be erected is at the end of the Rue Montmartre, fronting the church of St. Eustache; and the idea of raising one vast *halle* on the site of several petty markets belongs to the Emperor Napoleon. The municipality has purchased nearly 200 houses for demolition, and several small streets have been already pulled down. Eight detached edifices will compose the market, with vast cellars under them to serve as magazines. It is probable that six years will be required for the completion of the work, for which considerable sums have been voted by the municipal authorities and the Legislative Assembly. The direction of the works is entrusted to MM. Victor Baltard and Felix Callet, architects. The pavilions will be covered with zinc, and supported by iron-work; and the *halle* will be traversed by wide streets, with bridges, vaults, and ways wide enough to allow unembarrassed traffic during the whole of the day.

In the middle of the space above described, is a mast, 90 feet high, was placed in the centre of eight other masts about 60 feet high. The central mast was surmounted by a flag, somewhat similar in shape to the ancient *oriflamme*, representing trophies of various kinds, with the arms of the city of Paris, and inscribed with the dates of the periods most memorable in its history. The history of the *Halles* from the years 1811 to 1851. The central mast had on its banner the words "Municipalité de Paris." Three galleries, or platforms, about a foot or two from the ground, were formed, the central one for the President and Vice-President of the Republic, the President of the Assembly, the Ministers and the General commanding the National Guard of the Seine. The one on the right was set apart for the members of the *corps législatif*, and the left for the members of the Municipal Council. Another platform was destined for the different authorities, the functionaries of the *Halles* or markets, the syndics of the bakers and butchers, the deputations of each class of trades. The two were two compartments rising in the form of amphitheatres, and a smaller one, one the same level, and quite close to that occupied by the President.

The space on the left was chiefly filled with the female traders of the *Halle*, dressed in their gayest and richest attire; and the one to the right with strangers invited to the ceremony. A little after twelve o'clock, all the places were occupied; and an immense multitude covered the external grounds, where detachments of the mounted Republican Guard, the gendarmerie, and *sergens de ville* preserved order, and kept the passage free.

At half-past twelve o'clock the Prefects of the Seine police, and other public functionaries made their appearance; and at a few minutes past one the bells of St. Eustache announced the arrival of the principal personage of the day. Louis Napoleon entered the open space, accompanied by the Vice-President of the Republic, the Ministers, and other functionaries. The whole assemblage stood up as he appeared, and saluted him with shouts, waving of hats and handkerchiefs, and clapping of hands. Some cries of "*Vive le Républicain!*" were heard from the summit of the amphitheatre to the left, but they were drowned in the hearty welcome given him by the women of the *Halle*. The clergy, headed by the parish priest of St. Eustache (the Archbishop was prevented by ill ness from attending), performed the religious ceremony, and a hymn was sung by the choir. The Curé then advanced to the platform, where the chair of the President was placed, and read a complimentary address.

The Prefect of the Seine then advanced and addressed the President, thanking him for his presence.

The President replied to these addresses as follows: -

"Gentlemen,—It is now forty years since the idea was entertained of raising a vast monument to preserve from the inclemency of the seasons the numerous class of persons whose laborious and daily occupation is to supply the population of Paris with all that is necessary for its existence. But, thanks to the enlightened direction of the Minister of the Interior; thanks to the energetic co-operation of the Municipal Council of Paris, and of its worthy Chief; thanks to the decision of the National Assembly, the idea will be accomplished in all at length accomplished. The construction of these markets, a real benefit to humanity, facilitates the supplies of Paris, and invites a greater number of departments to combine in its trade. Work, then, will be found for many municipal, for Paris is the heart of France, and the more active and powerful its life, the more it is communicated to the rest of the country. In laying the first stone of an edifice whose destination is essentially popular, I confidently cherish the hope, that, with the protection of the Almighty, and the co operation of all good citizens, we shall be enabled to lay in the soil of France foundations wherein to erect a social edifice sufficiently solid to afford shelter from the violence and the fickleness of human passions.'

This speech was received with general and loud applause and repeated cries of "Bravo" and "*Vive Napoléon!*" The President then advanced; the coins and medals of gold, silver, and copper, were deposited before him in a box, bound with brass, which was placed in the cavity of the stone, and cemented in the usual manner. The President spread the mortar with a silver trowel, and struck three or four times with a hammer on the stone, and the shouts were renewed as the formality ended. Louis Napoleon then returned to his chair, and addressed some complimentary words to the Minister of the Interior. He at the same time declared the Count de Salles, the Prefect of Police, and to M. Léon Faucher, the decorations of Commander of the Legion of Honour, and shook hands warmly with each.

Not the least interesting part of the ceremony was when the women of the *Halle* descended from their benches, and, advancing in order, presented to Louis Napoleon twelve large and beautiful bouquets of flowers, in baskets exquisitely fashioned of wicker-work. The President accepted the gifts in the most affable manner, and courteously thanked the fair donors. With this the ceremony terminated. The President returned to the Elysée by the quays, escorted by a troop of carabiniers and dragoons. Previous to, and during the ceremony, detachments of Gendarmerie Mobile had been stationed in the Place des Victoires to keep order; and five of the Min sters were present. nam . M. Léon Faucher, M. Rouher, M. Fould, General Randon, and the Minister of Marine, also General Magnan, who commands the army of Paris

The Government of Hong Kong have passed an ordinance for the regulation of trial by jury in that colony The ordinance copies the English model, with two exceptions—one, the adoption of a jury of six instead of twelve; the other the substitution of the rule of a verdict by the majority instead of one by a unanimous jury.

The *Randolph* East India trader—Dale, master—belonging to Messrs. Dunbar and Co., Limehouse, was wrecked on the night of July 23, on [illegible] Madras to Calcutta, when Ensign E. H. Scott, of the 48th Regiment, and between 20 and 30 Coolies, steerage passengers, and two of the crew, perished.

BIOGRAPHY OF GENERAL LOPEZ.

NARCISO LOPEZ, a general in the Spanish service, who was publicly executed at the city of Havannah, on the morning of the 1st of September, was born in the year 1798, or 1799, in Venezuela, then a South American colony belonging to Spain, and was, accordingly, about 52 years of age. His father was a wealthy landed proprietor, owning large estates on the *llanos*, or plains, swarming with cattle, horses, &c. His mother, who is still living, is said to be a woman of much moral character and mental strength. Narciso was the only son that lived beyond childhood, though of daughters his parents had some fourteen or fifteen; and, according to the habitual life of the *llanos*, he passed almost from the cradle to the saddle, or rather to the back of a wild horse without any saddle—a training well calculated to lay the foundation of a character and habit of fearless hardihood, energy, and resolution.

Though so successful as a soldier, and though that success was achieved by the sheer display of extraordinary capacity as well as courage, Lopez was never fond of a military profession and life. He did not enter it from choice, but simply as the resource of desperation, under circumstances forced upon him, at the age of fifteen, by the civil war then desolating all the Spanish South American provinces. His father had been stripped of nearly the entire of his property, or had seen it rendered wholly unproductive through the operation of that cause; and with South America as he was able to realise he entered into commercial life at Caraccas, the capital of Venezuela, assisted by his son, who, boy as he was, was able to bear the burden of a large share of his father's anxieties. Another of young Lopez managed a branch of the Caraccas establishment, at the town of Valencia, in the interior. Whilst he was so occupied, Bolivar, the famous Liberator of Columbia, fought and lost the sanguinary battle of La Puerta, in 1814, and to protect his own retreat raised a garrison and inhabitants of Valencia into making a desperate defence of that place. Young Lopez took an active part in the resistance, which was prolonged for three weeks, but, as Bolivar did not come to the rescue, the place was necessarily surrendered. A horrid massacre, according to the too frequent custom of Spanish warfare, ensued. The two Lopez contrived to escape, but the younger, fired with indignation at the conduct of Bolivar, and chafed to rage by the result of the attack, enlisted as a common soldier in the King's army, then commanded by General Morales.

Such were the circumstances which made Lopez resort to a military career, and which threw him into it on the Spanish side of the civil war of that wretched period. He was a mere boy, and it was the only chance of life; while, at the same time, there was probably no inhabitant of Valencia who would have hesitated to shoot Bolivar, the chief of the patriot side, as the bitterest of enemies, had they had the opportunity. Spain was, moreover, under the reputation of Ferdinand VII., a civilised country, in the civil wars of which the cause of liberty did not appear to be solely on the patriot side. The battle of La Puerta was deemed to have completely crushed rebellion, though in fact the struggle was renewed and protracted, with various success, till the final evacuation of Caraccas by the Spanish army, in 1823.

At the end of the war, Lopez, who had thus entered in the ranks, found himself a Colonel, at the age of twenty-three, through the brilliancy and daring of his services. The first incident that attracted attention to him was shortly after his enlistment, during an attack upon a certain place defended by fieldworks, there being two bastions connected together by a curtain of about fifty yards in length. The Spanish force, divided into two portions, was engaged in attacking the bastions: the ammunition of the one portion failed, and signal being made to the other, the commander called for volunteers to lead three mules, loaded with ammunition, from one end to the other, a fire then raging along the line of fire of the enemy. Lopez was the only one who volunteered, and he set out with the three mules in a string, according to the custom of the country, the head of each fastened by a cord to the tail of the one before it, at about half the distance across, one of the mules fell dead. The mule killed being unluckily the middle one, it was necessary to untie the cord, and refasten the first and third together—all under a severe fire. He succeeded, however, in reaching his destination unwounded, though his gun was broken by one ball, his pantaloons cut by another, and his cap pierced by a third; he had the other mules wounded, but not to death, and the place was taken.

Besides other distinctions, he received during this war the rare military honour of the cross of San Fernando of the second and most distinguished degree—a reward not bestowed at pleasure, but to be obtained only on public demand by the person claiming it, and on the institution of a formal process for and against his right, everybody being free to interpose an objection, or to dispute the claimant's merit. In the whole army there was but one other individual who possessed the cross. On the occasion on which he received the cross of San Fernando was for daringly advancing and harassing the enemy, when Morillo, at the head of a force of seven or eight thousand men, was besieging the patriot force, numbering about 3000, over the *llanos* or plains of Venezuela, trying in vain to bring the latter to an engagement.

In the negotiations for the withdrawal of the Spanish army, he contributed much by his influence to cause the conditions to be such as they would have protracted the contest longer, though with no hope of eventual success—to relieve the country from the further evils of war. It is no small proof of what must have been the influence of Lopez even by those acts of daring, that, on the passage on the conclusion of the hostilities, he was invited by the patriot Government to enter its service in the same rank held by him in the Spanish army. He declined the offer, and, with the whole surviving army of Cuba, left for Spain in 1823.

The following anecdote is told of this period of his life. On one occasion, in South America, landing with an expedition, somewhat *à la* Cortez, in a wild and unexplored region, mighty warlike Indians, called the Caribs (*Indios bravos*), with whom his party had a severe engagement, he and they were near all perishing for want of water. Striking into the interior in quest of it, and marching all night, they came to the banks of a river—who could say whether they approached at about sunset by an Indian warrior, mounted on a magnificent horse, cream-coloured, with black mane and feet. Lopez was in advance, with a small company of his men, the remainder remaining behind to embark in the vessels from which they had landed the afternoon before had sailed, so that they had no return. A number had already died of exhaustion and thirst. They conveyed to them that he could conduct them to water, which they could reach by daybreak. But here arose the perplexity how far he was to be trusted. His purpose might be to decoy them away from the relief which they might otherwise perhaps find in the direction they were pursuing, and to lead them off astray to a certain and horrible fate. In the midst of this anxious uncertainty, Lopez solved the difficulty in a mode little likely to occur to another, by proposing to mount himself behind the Indian, on the powerful and fresh horse of the latter, and to go at the utmost speed in quest of water, and test the Indian; telling the commander that if he returned of course all would be well, while, if he did not, it would prove that he was killed, that the Indian was playing false, and that, therefore, they should in that case infer that, by pushing on in the direction they were going, they would probably find relief. The offer was accepted, and his companions remained on the bank of the rivulet. As it proved, the Indian conducted him truly, though Lopez had to plunge into the depths of the forest and of the night, mounted behind a guide who might lead him only into the midst of enemies. He reached the water, returned, and, by conducting them to it, saved the lives of the whole expedition.

From 1823 Lopez was a Cuban, having married and established himself in the island. The re-establishment of Spanism in Spain, by the aid of French intervention, overti-rowing, for the second time, the constitution of 1812, prevented his resumption of service, though he retained his nominal rank. He accordingly remained on half-pay as a Colonel of King Ferdinand's army, and the long-smothered Liberal party broke out from under the incubus which had pressed it down and arranged the ascendant in the Government of the country. The Liberals, during the first years they were paramount

FOREIGN AND COLONIAL NEWS.

FRANCE.

The persecution of the press still continues unabated in Paris. The direc.ors of the *Assicurant* (the lately established successor of the suppressed *Evénement*) and the *Presse* were each condemned, on Wednesday, to suffer six months' imprisonment, and to pay a fine of 1000 francs, for publishing articles reflecting upon the Government. The *Suffrage Universel* of Montpellier has been seized, and a prosecution is to follow, for the publication of an article expressing indignation at the department of the Ardèche having been put in a state of siege. On this subject the *Journal des Débats*, referring to the constantly recurring verdict of "guilty" returned by juries against journalists, offers this explanation:

"When he journals (observes the *Débats*) have to do with the jury they have to do with the calm law of the country in most accurate, most immediate, most constant, and most vexatious existence; and when they are punished, it is plainly for a public feeling that pushes them. What, in fact, do these severe penalties prove? They prove, what indeed we were aware of before, that the journals are without exception, out of favour with the public. It is beauty and not of beauty that the journals are unpopular. Public opinion is in one of those periods of reaction to conceal the fact—we are not popular. Public opinion is in one of those periods of reaction which generally follow irregular commotions: the experience and the fear of disorder conceal it to such extremes. We have no doubt that under the last Monarchy the newspapers of all shades as are now most severely punished would have been acquitted by the jury. We find nothing in them which has not always been found in the language of the Opposition at all times and in all countries—Governments of the foreigner!" "Allies of the Cossacks!" "Vassals of England!" &c. And who knows whether amongst those very persons who now so severely condemn this language there may not be to be found some who were accustomed to use it for twenty years. But to be found some who were accustomed to use it for twenty years. But to the time Jui wind was in the Liberal quarter, and the jury also. Both have changed. We do not say it is the fault of the Republic, as the Republicans say we have not a Republic; and do not say it is the fault of the Republic, as the Republicans say we have not a Republic; and in truth we don't well know what we have. But we do say it is the result of the troubles and disorders which, every revolution brings with it. The press not only suffers at this day the penalty of the vows expressed but it is made to do penance for the faults of every one. We must every day and in every class and shade of opinion who have caused their existence in opposition to "authority," who on the 24th of February cried "*Vivela Réforme!*" and who now, eye-witnesses of the glorious results of their own work, do not hesitate to say, "It is the fault of the press." But it is from that great mass of society that our judges are taken. It is not the epoch of the public prosecutor that proves the consternation of a journal; it is the epoch of the jury. That feeling is now against us, but, and we do not say so in a party feeling for it is about to change. It only follows the bad example given it by the press, we do not fear it from being the strongest. It only follows the bad example given it by the press itself, it always is from and to him will be followed by a reaction."

Several more of the persons arrested, supposed to be connected with the late conspiracy, have been discharged from prison, and, those who remain amount to about sixty.

Colonel Couston, the President of the last court martial at Lyons, has been promoted to the grade of Commander in the Legion of Honour.

The opposition journals ground, that the Prince de Joinville will certainly be brought forward for the Presidency.

The President of the Republic on Wednesday inspected several new regiments, by which he was warmly received. The spectators also hailed him with much enthusiasm.

M. de Lamartine has written a long article in the *Pays* upon the subject of the Presidency, from which we learn that he is opposed to the election of Count de Chambord, Prince de Joinville, and General Cavaignac; and that rather than see any one of these at the head of the state, he would prefer Louis Napoleon Bonaparte.

Their Royal Highnesses Don Henry of Spain and his wife, the Duchess, have arrived in Paris, where they purpose to remain until after the accouchement of her Royal Highness.

NAPLES.

The Neapolitan Government, according to advices of the 15th inst., has published a formal reply to the attacks of Mr. Gladstone on its cruel severity to political prisoners, particularly the ex-minister Poerio. The reply principally consists of an exposure of some inaccuracies of detail on the part of Mr. Gladstone, such as an exaggeration of the number of political prisoners at present confined in Naples, the alleged innocence of Poerio, the unhealthy state of the prisons, &c.; but it does not do away with the charge of savage severity in the punishment of Poerio and his fellow-prisoners, which formed the main accusation advanced by Mr. Gladstone against the Neapolitan Government.

SPAIN.

Intelligence, which would be of immense importance but for the speedy termination of the Lopez expedition to Cuba, has been communicated by the last advices from Madrid, which are dated the 19th instant. It is in effect that the Spanish Cabinet had received intelligence that the English Government had given orders to the commander of the English naval forces in the West Indies to resist, in conjunction with the Spanish authorities, all attacks made by American pirates on Cuba, and that the French Cabinet had also given similar instructions to the commander of the French forces. It is gratifying to know that both the English and French Governments were resolved upon active interference in defeating this unjustifiable attack upon their ally.

PORTUGAL.

Accounts from Lisbon to the 19th inst., and Oporto to the 20th inst., state, that, in consequence of the prevalence of the yellow fever at Oporto, the Board of Health had issued an order subjecting all vessels from that place to eight days', and from Vigo to fifteen days' quarantine.

The Septembrist party was becoming more and more ascendant daily, which was caused, it was said, by the fact that the Queen had sent for the Duke of Terceira, to whom she expressed her great displeasure that his Grace should have joined the Cabralite faction. Her Majesty felt it necessary, in the present crisis, to have with her a high office at Court, it would lead the public to believe that she was clandestinely encouraging the Cabralite party, which she altogether renounced, because she was satisfied that the feuds of the country proceed both in Court and in the Government. The result of the conference was, that the Duke of Terceira promised to separate from the Cabralites. This act of the Queen had given great satisfaction to the public generally.

Great complaints were making at the police regulations, which subjected Englishmen to the payment of exorbitant fees in travelling through Portugal, while no such demands were imposed upon the Portuguese who had occasion to pass through England.

The excessive heat had greatly injured the vineyards, and the vintage will therefore be below the average.

UNITED STATES.

Advices to the 13th inst. have been received from New York.

The important news from Cuba will be found in another place.

A new political party has sprung up in the city of New York, called "The German Free Soil Democracy of New York." Its programme is divided into two parts: the first, on national politics, goes to give the public lands in limited quantities to actual settlers, the State, however, remaining their sole proprietor; for the abolition of the Fugitive Slave Law; the admission of no more slave states or territories; against a United States Bank and all monopolising corporations; for Free-trade, but with the maintenance of the tariff as a means of protection as to the other commercial nations; for the improvement of harbours and rivers by Congress for the building of the Pacific Railroad by the nation, and for the election by the people of all the officers of the Federal Government. In respect of State politics, the programme is for universal suffrage without distinction of colour; direct election of all officers by the people; submission of all important measures to popular vote; for the passage of laws authorising and regulating the turning out of office by the people of a representative or other officer who has not come up to the mark; amendment of the homestead exemption law; equal taxation, and exemption of the poor; extension and improvement of the school law; abolition of the death penalty; improvement of the state of prisons and abolition of the cellular system; limitation of the hours of labour to eight or ten hours for adults, and five for children; encouragement and incorporation of industrial associations, with the same charters, rights, and privileges as other commercial and manufacturing corporations; and in the letting of public works, such associations to have the preference.

The heat at New York was excessive.

A terrible storm has visited the southern part of the United States, particularly along the Gulf of Florida, and has been very disastrous to the cotton, sugar, and tobacco crops. The cotton crop in Alabama had suffered before the storm from drought, and only half or two-thirds of a crop was anticipated. The storm then set in, and raged for twelve hours, destroying the crops in many districts almost entirely. Several parts of Georgia, Alabama, South Carolina, and Florida have suffered severely. The effects of the gale in Florida were especially disastrous. A large amount of property was destroyed, including nearly the whole of the tobacco crop, and a number of barns, cotton-sheds, and other buildings. The corn and cotton crops remained uninjured.

In New Orleans the Cuban expedition projects are now entirely abandoned, and there are a great many liberators in that city without the means of returning to their homes. They demanded money of the Cuban committee, and some disturbances arose and arrests were made, but nothing serious has occurred thus far. The police are out in force in case of any outbreak. The United States steamer Fizen sailed from Pensacola on the 31st inst., for the mouth of the Mississippi, and intercepted any expedition that may attempt to leave with a view of invading Cuba.

Frederica Bremer, the Swedish novelist, was to start for home in the *Atlantic*, on Saturday, the 20th. Miss Bremer has been in America some two years, during which time she has travelled in all the Atlantic and Mississippi States, and has seen much of American society and scenery. Soon after her return she will publish her notes and observations, and Mary Howitt will translate and publish, at London, an English edition.

The number of emigrants landed in New York during eight months ending in August of this year was 192,836, against 143,709 last year, being an increase of 49,134.

Three individuals had been shot in Pennsylvania, while endeavouring to seize a fugitive slave, one of whom was the owner of the runaway.

There are two weeks' later intelligences at New York from California, reaching to Aug. 1, by the steam-ship *Prometheus* from San Juan. The accounts from the southern mines are satisfactory, especially in regard to the quartz veins. The burnt district in San Francisco has again been covered with houses during the four weeks that have elapsed since the fire. Few traces of the conflagration remain in the lower part of the city, and the light wooden buildings that were destroyed are being replaced by substantial erections of brick.

Our data from Oregon, by way of San Francisco, are to July 22. Several skirmishes have taken place between the United States troops and the Indians, in which the latter were defeated with considerable loss. It was supposed that the Indians were not inclined to further hostilities at present, and the American camp was accordingly broken up.

CUBA—FATE OF LOPEZ.

The intelligence from Havannah is to the 6th of September. That city had been restored to tranquility by the destruction of the Lopez expedition. The news of the capture of Lopez and his followers reached Havannah on the 28th ult., and immediately flags were hoisted, guns fired, and at night buildings were illuminated and torch-light processions formed. In fact, it was a time of general rejoicing.

Lopez was taken in the interior, wandering alone, nearly exhausted from fatigue and hunger. He asked for something to eat at a farm-house, and permission to lie down: while asleep he was bound and made prisoner. Of his followers, 155 were taken. Their sufferings previously were intense. For several days they lived on the leaves of trees, &c., and the last meat they ate was the horse of General Lopez. They had no arms when taken. The remainder of the party have either been shot, or they perished from hunger. Of the Spanish troops who perished in action, the American account states the number as 1500, and 500 wounded; but this is an evident exaggeration, more than one-half the Spanish loss at 200. Gen. Enna, one of the bravest correct estimate facing the Spanish loss at 200. Gen. Enna, one of the bravest officers in the Spanish army, was shot, while leading a charge at the head of a small squadron of cavalry. He was second in command to Concha, the Captain-General of the island. In no instance (the prisoners say) did the Creoles of the island manifest the least disposition to join them.

On Monday morning, Sept. 1, Lopez was executed as a felon by the *garotte*, an instrument consisting of an iron collar, with a screw at the back, which is tightened on the neck until strangulation ensues. The scene of execution was at the "Punta," opposite the "Moro," in Havannah. There were assembled from 6000 to 10,000 troops, and as many citizens. A few minutes before seven, Lopez was brought forward, and ascended the platform with a firm and steady step. Facing the multitude, he made a short speech, and his last words were—"I die for my beloved Cuba." He then took his seat: the machine was applied: at the first twist of the screw his head dropped forward, and he was dead. Thus ended the career of General Lopez, so long the terror of Cuban authorities.

A day or two subsequently, four of the unhappy man's companions in the expedition were liberated by order of the Captain-General. Two of them preceded by the ship *Norma* to New York, and another went on board the United States frigate *Albany*. What the fate of the remainder of the prisoners would be was not definitively known.

CENTRAL AMERICA.

A civil war, which has been imminent for some time past in Nicaragua, has at last broken out. According to one report, all the members of the Government have been shot by order of General Munoz, late Minister of War. Another report says that they were banished from the country, and sent on board a vessel just sailing from Realejo for California. During the time in which this happened, the Cameras (Congress) were assembled in extraordinary session at Managua. When the news arrived, they elected a new Director Supremo, and then dispersed. The elected is Don José del Montenegro, a man whose state of health makes him unfit for the exertions of so dangerous a position. At Leon another Director Supremo appears to have been elected, and the name of Ubanca, a member of the Senate, is mentioned. The report says that the General is marching his army against Grenada, the main seat of the Tumbuco party.

CANADA.

The removal of the paraphernalia of the Canadian Government from Toronto to Quebec has been commenced.

The general election in the province of Nova Scotia for members of Parliament has resulted in a majority for the existing Government. The Hon. the Provincial Secretary, the Attorney-General, and the Financial Secretary, leading members of the Cabinet, have been re-elected. The first gentleman, Hon. Mr. Howe, was returned for Cumberland county without opposition. Hon. Mr. McKeagney was defeated. Several counties have partially or totally changed sides in politics since the last election. The members returned stand 32 or 33 to 16. Our data doubtful. It is probable that when all are heard from, one or two seats under protest are determined upon, the Liberals will have their old majority, seven possibly nine.

The construction of the railway from Halifax to Portland, and through New Brunswick to Quebec, may be considered as secured. That question has been one of the prominent points in the election—the Liberals being in favour of, and the Conservatives opposed to it.

WEST INDIES.

According to advices dated Jamaica, August 31, the hurricane which swept over Florida with such fury on the 22nd of August, extended south to the West Indies. The steam-ship *Georges* encountered it on the 26th, in the Nicaragua Passage, on her outward voyage to Jamaica. She was hove-to under bare poles put into Jamaica. The British Royal mail steamer *Great Western*, on her way to St. Thomas, met the hurricane in Mona Passage. She was knocked down upon her beam-ends, shipped several heavy seas, and had her wheel-house and bridge carried away, and was in imminent danger of being lost. The loss of vessels and lives in the West Indies, by wrecks, it is expected, is very great. The hurricane was felt at Jamaica, but not so severely as in other islands, yet sufficiently to do much damage. The island of Porto Rico has suffered greatly. Most of the plantations are utterly ruined beyond resuscitation for one or two years. Thousands of cattle and horses and other animals were killed, and many persons lost their lives. The plains were inundated, and in the vicinity of the mountains worked into immense gullies by the force of the torrents. A gentleman who visited the mountains on Porto Rico, to view the surrounding country of one of the most fertile regions, describes it as one entire scene of destruction and desolation, by the winds and waters.

The cholera was still prevalent at Jamaica, though in many cases unattended with fatal results, owing to the prompt remedies applied.

Influenza was prevalent at Demerara and Barbadoes, so much so at the latter place that the Assembly was unable to meet.

THE AUSTRALIAN EL DORADO.

Further particulars relating to the "diggins" have been published from letters received from the firm of Smith, Campbell, and Co., of Sydney, and are the more interesting from the fact that Mr. Campbell was one of the first persons to ascertain the truth of the report, and also because they narrate the progress of affairs from the commencement down to the latest date.

"Sydney, May 24.

"We now give you a report, which, though only preliminary, is authentic. Our Mr. Campbell left this on the 17th inst., to satisfy himself of the truth of accounts that were likely to be attendant with results so momentous to this colony. Through bad roads and floods in the rivers, he did not reach Bathurst until the 22nd, when he at once proceeded to

"It is no longer a matter of speculation as to whether there is gold in this district. I have seen quite enough to convince me that not only there is gold, but that it exists in great abundance in other districts.

"This town (Bathurst) is literally deserted, servants, tradesmen, and all having gone to the mines, save only those who cannot afford to leave their homes and their property. The consequence of the state of things is, that we have no remittances forwarded to Sydney, for as yet none of the flockmasters in this quarter have suffered from the shepherds leaving for the mines."

"May 29.

"In consequence of the forebodings of the press when the gold discovery was first promulgated in Sydney, as to the baneful effects on the pastoral interests, our Mr. Campbell thought it desirable to proceed to the spot to ascertain the truth of the reports in circulation, and if possible to judge how far go diminished would the supply of labour be. In this visit Mr. Campbell was accompanied by Messrs. Brown, Hindson, and Farris, who made a joint purchase of upwards of £800 worth of gold, which is now shipped on board the *Thomas Archbold*, Captain Heaton, to the address of Messrs. D. Dunbar and Sons, of Limehouse. In this parcel is included several large pieces, the largest weighing 65½ oz troy weight. This piece has received the name of "The Goliath of the Australian diggings." The Government were not thoroughly satisfied of the existence of a rich gold field until the return of Mr Campbell and his party with a large quantity of the precious metal, a considerable portion of which they brought down with them in their own private parties. accounts which had reached town in the meantime set specu ation afloat. Thousands of persons left the city immediately for the diggings, in search of wealth; every description of mechanic, who had saved a little, purchased the requisite implements for the journey; deposits in the savings-bank were withdrawn to a large extent, and invested in picks, spades, &c. You will, doubtless, be surprised at the sudden change in the Australian diggings. The Government were not thoroughly satisfied of the existence of a rich gold field until the return of Mr Campbell and his party with a large quantity of the precious metal, a considerable portion of which they brought down with them in their own private parties. accounts which had reached town in the meantime set specu ation afloat. Thousands of persons left the city immediately for the diggings, in search of wealth; every description of mechanic, who had saved a little, purchased the requisite implements for the journey; deposits in the savings-bank were withdrawn to a large extent, and invested in picks, spades, &c. You will, doubtless, be surprised at the sudden change in the Australian diggings.

"June 11.

"As regards the gold discoveries, every post from Bathurst confirms, not only their extent, but their value. There are now upwards of 3000 men at the diggings in the Summer Hill-creek, and the gold has been discovered in two or three other localities in the vicinity in considerable quantities. The mines continue to be very orderly, and cheerfully pay the licences of 30s. per month imposed by Government. The 'mines' up to the present time have been visited chiefly by mechanics, traders, and such like from this city and the country towns, many of whom have since returned, having soon found out that the occupation of gold digging is not suited to their tastes or constitutions. It is also confidently expected by those best able to judge, that the whole of the immense population of South Australia will find its way to our gold-fields; and if they do, we are confident their habits and mode of living are more calculated to ensure success at gold-seeking than those of any other portion of the working population.

"It is not going beyond reasonable bounds to say, that abundance of labour and gold will engender a degree of prosperity in this colony quite beyond all previous calculations."

THE FAMILY COLONISATION LOAN SOCIETY.

A public meeting on emigration to Australia from time to time occurs, which reminds the community of the success which attends the unobtrusive efforts of the benevolent Mrs. Chisholm, and the silent and slow, though sure working, of the excellent, and, in a great measure, self-supporting system of colonisation, which that very able and constant benefactress of the poor emigrants has succeeded in establishing in the metropolis, despite drawbacks and difficulties which would deter any but an heroic woman in the pursuit of a favourite purpose of beneficence.

Such a meeting took place on Monday last, on the deck of the *Athenian*, lying in the East India Dock, a vessel chartered by the Society to sail for Port Philip and Sydney on the 27th inst. It may be well to explain that the Family Colonisation Loan Society has for its object the foundation of a self-supporting system of colonisation to the Australian colonies—the colonists paying two-thirds of their passage money before leaving England, and the society advancing the remainder, to be hereafter repaid by instalments or otherwise. The passage money for adults is £12 10s., and for children under fourteen years of age half that sum; and the two-thirds found by the colonists are in the majority of instances paid into the exchequer of the society in sums of 2s. or 5s. per week. The society forms the colonists into groups prior to embarkation, under the plan proposed by Mrs. Chisholm, the foundress of the society, so that parties about to emigrate may become mutually acquainted with each other; and young unfriended girls are introduced into the groups, and placed under the surveillance and care of the married women—no persons excepting those of irreproachable character being received into the groups. The registered measurement of the *Athenian* is 680 tons, and, according to Government regulations, would be allowed to carry 235 adult passengers; but, in order to give the emigrants every possible accommodation, the society only received 205, which, with children, made the number of passengers about 280. The arrangements on board the vessel, to secure the comfort of the passengers, were of the most satisfactory description, and every attention was paid to the ensuring a perfect satisfaction as to the berths, and providing for the wants of the passengers, should any of them be ill on the voyage, three surgeons being attached to the ship.

The scene on board the *Athenian* on Monday was of the most extraordinary description. A very large portion of it, including the lodging, being most densely crowded—a large portion of the company on deck consisting of ladies and female emigrants, who appeared of rather a superior description to those usually seen on board of emigrant vessels. The vessel was dressed in the colours of all nations.

The Earl of Shaftesbury presided on the occasion.

Among those present were Mr. Robert Lowe, late member of Council for Sydney; Mr. Leslie Foster, late member of Council for Port Philip; Mrs. Chisholm, and a great number of ladies. A letter was here read by the chairman from Mr. Hanson Smith, M.P., giving encouragement to the emigrants, and instruction as to the course they should pursue on their arrival in Australia.

The Earl of Shaftesbury said that he had been requested to address the emigrants assembled, and he did so with extreme pleasure, because he was most anxious to express his approbation of those who, by their own exertions, were reaching the home of their adoption, which exertions were highly creditable to the class to which they belonged. He certainly felt some regret at taking leave of them, but that regret was considerably mitigated when he remembered that they were about to quit this country to aid and assist by their knowledge and energies the parts of the earth. They had no doubt all heard of the discovery of gold fields in the Bathurst district, where gold was said to be of unlimited extent, and the great excitement that was likely to create among other parties emigrating to that colony. Now, it was not for him to say whether or not that discovery might be for the benefit of parties such as he saw before him; but what he would warn them against would be not to devote the whole of their energies to gold seeking, and well to consider the dangers to which they would be exposed. He did not say but that great benefit might arise from the discovery. It might be the means of drawing multitudes to that colony, and peopling its immense wastes; but while they might partake of the general good, they must not be trusted, go out with their minds entirely bent upon that object. However, having been warned of the consequences, they would go there with their eyes open, so that by God's blessing nothing should be wanting to render honest, steady, and industrious exertion. For they might rely upon it, all the gold that could be obtained would never equal the claims of an honest, industrious, patient, and religious population. Let them go to the land of their adoption with the Word of God in their hearts, and to bear in mind that, though there might be gold in the bowels of the earth, that it should only be worked out for God's honour and man's benefit. He now wished to make one or two observations in reference to a statement which he had made at a public meeting in Edinburgh some time ago, and which had been called in question by various parties. At that meeting he had stated, on the faith of information which at the time he had reason to doubt, that he considered Sydney was not a fitting place to send respectable female emigrants to, and that was the last place to which he would send them. Since that time he had received several communications from Sydney, from persons with whom he was acquainted with respectability, denying the truth of the statement; and, from inquiries he had subsequently made, he was inclined to believe that the statement he made in respect of Sydney was not correct, and he now took the first opportunity he had of contradicting it. Having received the observations on the great danger of following too closely the pursuit of the precious ores, the noble Earl earnestly hoped that their change to the shores of Australia might be made instrumental to the advancement of God's honour and glory as well as their own, and that they might live long in this world, and enjoy everlasting happiness in the world to come, he affectionately bade them farewell.

Mrs. Chisholm was also addressed by Mr. Lowe and Mr. Foster. The latter gentleman pointed out to his auditors that there was no colony which afforded a greater field for industry, and in which there was less likelihood of contamination. The character of the colony on a youngered an honest character more valuable. (Cheers.) Much delusion prevailed in this country as to the hardships which attended emigrants. No doubt, frugality and industry were essential, but this was the case in every country to those who would thrive well. The speaker then entered into the various advantages of the Family Colonisation Society, calling special attention to the fact of the reunion of families, before separated, in the colonies. There had not as yet been one instance of default amongst the emigrants who had gone out in re-payment of advances; and Mrs. Chisholm's emigrants were certainly the best liked amongst the colonists.

Mr. Sidney said, that, up to the present time, Mrs. Chisholm had sent out upwards of 600 emigrants. That lady had herself been in Australia some years ago, and seeing the difficulty which emigrants had to contend with in obtaining labour, had taken steps for promoting their interests, and had herself opened an asylum for the female emigrants.

A vote of thanks to the Chairman, who duly acknowledged the compliment, closed the proceedings. The greater portion of the company then went and examined the accommodation provided for the emigrants, Mrs. Chisholm readily affording any information required.

AUSTRALASIAN LEAGUE AGAINST THE IMPORTATION OF CONVICTS.

(To the Editor of the ILLUSTRATED LONDON NEWS*)*

SIR,—The Tasmanian branch of the Australasian League have requested me to forward to you a copy of a protest addressed to Earl Grey. In haste, Sir, yours most obediently,

F. HALLES, Hon. Secretary.

Hobart Town, May 30, 1851.

[illegible] Town, May 30, 1851.

My Lord, [illegible] have learned [illegible] that the [illegible] of the [illegible] and [illegible] of the [illegible] [illegible] [illegible]

THE KAFFIR WAR.

THE 74TH HIGHLANDERS ATTACKING KAFFIRS.

74TH HIGHLANDER

We have been favoured with the accompanying Sketches by a Correspondent, whose communications are dated from "Camp Amatola," July 11 and Camp Yellow-woods, Kroomie River, July 17. These Sketches were taken by our Correspondent while accompanying the first division of the army in Kaffraria, under the command of Major-General Somerset, by whose kindness opportunity of forwarding them has been afforded.

The View below represents the Hogback, or highest peak of the Great Amatola Mountain, with bold precipices and forest-clothed ravines beneath it. This was the stronghold of the hostile tribes, and which, until lately, they supposed inaccessible to British troops. Immediately under the peak is a beautiful cascade, forming the main source of the Amatola River; near it is the ascending smoke of a kraale just destroyed by the Fingoes; and further up on the rising ground to the right, the 74th Highland Regiment, advancing in a well ordered line, flanked on each side by a party of Fingoes, and firing volley after volley upon the rebel Hottentots on the brow of the hill above them—their wily enemies supplying the place of military skill by native cunning, sheltering themselves behind huge rocks from each volley, and taking advantage of the moment while the troops were reloading, to spring from their concealment and answer with an irregular but fatally directed fire, killing and wounding several of our gallant men. They were at length driven from one position to another, when the regiment and Fingoes took possession of the heights, and destroyed the huts found upon them.

Another Sketch shows the first troop of the Cape Mounted Rifles, under Captain Carey, attacking a party of the enemy concealed in a dense bush. No Kaffirs were visible, and their presence was only indicated by the shots that issued from behind the trees, while our mounted men on the outside formed a conspicuous mark for the fire of the lurking savages. Our Correspondent had barely time to make a hasty outline of the scene, when the fire of the enemy ceased, and the troop, drawing off, fired occasionally at any point that was supposed to conceal an enemy, till the arrival of the Fingoes and Hottentot levies, who swept through the bush, and soon completely cleared it.

The remaining six incidents were taken while the Sketcher was accompanying the patrol under Major-General Somerset.

"The patrol left camp," says our Correspondent, "on the Koonap River at 3 A.M., on Monday the 14th, and after marching some distance up the valley of the Gols, one of its tributaries, turned into the

HOTTENTOT REBELS.

DISPERSION OF A BODY OF KAFFIRS

THE KAFFIR WAR.

CAPE MOUNTED RIFLES ATTACKING KAFFIRS.

ASCENT OF THE BUSH PATH.

Water Kloof,' a deep, bushy defile, with very bold crags on its northern side; and at intervals the deserted dwellings of our farmers, burned and plundered by the enemy, in the more open parts of the valley. Emerging from a shady avenue, embowered by overarching trees, we observed a number of Kaffirs upon a rocky headland before us, apparently intending to dispute our passage, and soon had more tangible evidence of the closer proximity of others; when the 74th Highlanders and Fingoes entered the bush to the right, and drove the enemy to the rocks above, while the Cape Corps guarded the valley on our left. The gun was now brought up, and a round shot, followed by two shells, thrown among the party on the hill—with what effect, we could only judge from the haste they used in dispersing. The Sketch shows the shell bursting over the enemy in the act of [illegible], with some of the Fingoes and the 74th Regiment shelling the bushes, awaiting the order to advance. Near the gun is the Major-General.

"Shortly after this we reached a steep, rocky [illegible] road we through a dense forest of tall timber trees, on the head of the Kloof. The horses were soon found insufficient to draw the gun up, and they were

CAPE CORPS HOTTENTOTS.

FINGOE CAVALRY.

sent forward with the limber; while the gun itself was taken in hand by successive companies of the 74th, and by dint of severe exertion forced up after it. The gun is just visible in the Sketch, surrounded by the men pushing it forward, while others are hauling on the ropes attached to it. Near the gun stands the General; and just below him, near the tall bare yellow-wood tree, is one of the band of the 74th, his bagpipes slung behind his blanket, and on his shoulder a stretcher, for the use of the wounded. Next are the Cape Corps leading their horses, and mixed with them are Fingoes, Hottentots, and led and pack-horses of all descriptions. On each side are the Fingoe skirmishers firing at the enemy in the bush; at the bottom is a wounded Fingoe, borne on the stretcher by his comrades; and near him another, named Zinangua, bearing a weapon something between a sickle and a bill-hook, and wearing the plumes with which the General had lately rewarded his courage. On the right is a horse found wounded, and despatched by our people: he had been a pack-horse, carrying medical stores for the force under Major Somerset, and, had it lived, it is supposed, been mistaken by the enemy for one of the ammunition horses, and shot with the view of supplying themselves.

"Of the smaller Sketches, the first is a fellow, supposed to be a Hottentot, who fired several well-directed shots from a hill above us—one striking an ant-hill, under the bow of a Cape Corps trooper, who was resting on it, and filling his face with the dust it raised. Colonel Fordyce, of the 74th, tried, I believe, a rifle ball upon the fellow; but it was impossible to dislodge him, and he remained in perfect security, annoying us as long as we were within his reach.

"Next is a mounted Fingoe, armed with a musket, and his native weapon, the assagai.

"Next is a man of the 74th Highlanders, in his bush costume, the best I have yet seen for the work. It is simply his dark frock dyed with logwood to a dingy purple grey, and a brown leather pouch, strapped round his waist, as worn by our levies and burghers; and not being so conspicuous in the bush as the regular uniform, exposes the soldier less to the aim of the sharp-eyed Hottentot marksman.

"The last sketch shows a group of Cape Corps Hottentots round their fire, in bivouac, on a frosty morning; the sentry of the 74th, to the left, has thrown his blanket over his head and buckled it round his neck with a leather strap. The hill on the left is the Didima; and that on the right the Little Winterberg, or Kat River Mountain: Post Relief lies between the two."

We need say nothing to recommend these truthful Sketches, and the circumstantial narration that accompanies them, to the attention of the reader.

CALENDAR FOR THE WEEK.

SUNDAY, September 28.—Fifteenth Sunday after Trinity.
MONDAY, 29.—Michaelmas Day. Lord Nelson born, 1758.
TUESDAY, 30. St. Jerome, first translator of the Bible, died, A.D. 421.
WEDNESDAY, October 1.—Pheasant shooting begins.
THURSDAY, 2.—London University opened, 1828.
FRIDAY, 3.—Old St. Matthew.
SATURDAY, 4.—Sun rises 6h. 6m., sets 5h. 32m.

TIMES OF HIGH WATER AT LONDON-BRIDGE, FOR THE WEEK ENDING OCTOBER 4, 1851.

METROPOLITAN NEWS.

PRINTERS' ATHENÆUM.—On Monday evening a public meeting was held at Anderton's Hotel, Fleet street, to promote the formation, in the words of the prospectus, of "a literary and social institution for printers, bookbinders, typefounders, and the trades connected therewith, as also for the working classes generally," under the title of the Printers' Athenæum. Under the designation of "printers" the prospectus explains that they mean to include "all who are engaged in the production of a newspaper or book, such as editors, authors, reporters, master-printers, overseers, readers, as well as letterpress and copperplate printers." The objects of the institution are thus set forth in a printed prospectus, which was circulated in the meeting-room:—"The committee forbear to enumerate the many advantages which such an institution as that under consideration is almost certain to afford, lest the enumeration should end in disappointment and regret. But, as the intention is to found a literary and social institution, this much may be stated, that it is sought to combine all the uses of such societies with many essentials and luxurious accessaries for the comfort of their members. In the room set apart for the purpose, a member may be accommodated, from 8 A.M. to 11 P.M., with refreshment at cost prices. To provide him with tea and coffee at all times, and, as a first meal, dinner, or what is sometimes termed tea, is intended, from the early efforts of the Athenæum. To fit up, in a respectable way, a capacious reading-room, with smaller rooms for the use of those studying, and to place before the members three or four of the daily and weekly journals, a certain number of the weekly, monthly, and quarterly publications; to build up a library of the best books, ancient and modern, suitable for instructive and general reading, for home as well as at the Institution, and to ask the attendance of the members at least once a month to hear a lecture delivered by the most proficient literary and scientific men of the country (i. e. those who are to be engaged for this purpose), are the leading features of the proposal; but it is further intended, by the establishment of an evening class, to instruct the male children (above twelve years of age) of the members in the English language; by the formation of classes for the attainment of foreign languages, &c., under competent teachers; by the practice of music, and quarterly public readings

ALPACAS, IN THE KNOWSLEY MENAGERIE.

SALE OF THE MENAGERIE AND AVIARY AT KNOWSLEY.

THE matchless collection of birds and mammalia for which Knowsley has become celebrated throughout Europe, is announced for sale by public auction on the 6th October next; and is to be viewed on Monday next and four following days, when an extraordinary concourse of the naturalists of all nations may be anticipated. In the competition which, no doubt, will ensue, to secure specimens, most of which are extremely rare, and many of them unique, it is to be hoped that the Zoological Society of London will be liberally represented.

The Knowsley collection is a monument to the life-long assiduity of the late noble President of the Zoological Society, who commenced its formation in early life, and whose latest exertions were connected with its further extension and improvement; and it cannot but be deplored that the result of such an amount of knowledge, liberal expenditure, and enlightened zeal, should be broken up, on having arrived at this point of completeness, with little prospect of our seeing the like again for, in collections depending upon popular support, the more striking features of the animal kingdom must necessarily take precedence of those minute links and varieties in nature which constitute the harmony of scientific arrangement.

The ground occupied by the Menagerie and Aviary extends over one hundred acres of land and seventy acres of water; and the number of specimens contained in this space comprises 94 species of mammalia, containing 346 individuals. The number of birds, exclusive of poultry, is 318 species, containing 1272 individuals; the total number of species being 412, and of individuals 1617. The arrangements for the accommodation of the birds and animals is distinguished by simplicity and appropriateness, each animal or group enjoying abundance of space—the birds under a wired cover, and the mammalia with a good range in spacious paddocks, having appropriate shelter; and the care and provision necessary to the maintenance of such a variety of creatures differing in their habits and temper, reflects the highest credit upon the judgment and systematic management of Mr. Thompson, the head keeper.

The specimens selected for illustration this week are a group of Alpacas, containing eleven individuals, bred at Knowsley—six male, and four females and fawn. In this group the Artist has represented the curious and somewhat uncouth manner in which the animals stand and gaze at the appearance of a stranger. The second Engraving shows a

BLACK-NECKED SWANS, IN THE KNOWSLEY AVIARY.

MR. S. A. NICHOL'S "NEWMINSTER," WINNER OF THE GREAT ST. LEGER STAKES, AT DONCASTER, 1851.—(SEE PRECEDING PAGE.)

group of black-necked swans, a rare species, of which, we believe, there is no other living specimen in this country.

This great collection, the entire cost of which cannot well be appreciated, but which is known to have been kept up at an annual expense of upwards of £10,000, is intended to be sold in the following order:—

1st day's sale	.. Monday, 6th October	..	The Deer.
2nd ,,	.. Tuesday, 7th ,,	..	The Antelopes.
3rd ,,	.. Wednesday, 8th ,,	..	The Cattle, Goats, Sheep, and Llamas.
4th ,,	.. Thursday, 9th ,,	..	The Zebras, Kangaroos, Rodents, Lemurs, Armadillos, and Dogs
5th ,,	.. Friday, 10th ,,	..	The Birds.
6th ,,	.. Saturday, 11th ,,	..	Ditto

We shall give further illustrations of this important collection.

THE LAW OF STORMS.

THERE has just issued from the press the first of an intended series of "Narratives of Storms, by Sea-Commanders."* It is pretty well known, that, for the last twenty years, Col. Reid, Mr. Redfield, and others have laboured to establish a Law of Storms. Amidst the ruins caused by the hurricane of 1831, in Barbadoes, Colonel Reid had his attention first fixed upon the subject. The idea forced itself upon him, that, with all their apparent suddenness and fury, these tempests blew in some determined course, the discovery of which might serve to make them less terrible and destructive. He sought to form no theory, but set to work with the zeal of an enthusiast to collect facts.

In a ship's log-book are set down her exact place at particular hours, the state of the weather, the direction of the wind, the condition of the sea, the amount of sail carried, the management of the ship in rough weather, with its results and accidents; so that, where the captain is an educated man, the log-book furnishes the data for an almost hourly picture of the ship, and a complete chart of her course.

Hurricanes almost constantly at the same period of the year swept the same seas. The log-books of East Indiamen, and ships of the Royal Navy and of the American navy, and first-class commercial marine, thus contained the needful facts for a complete tracing through a course of years of the most remarkable hurricanes. The daily notes of any one ship would have been comparatively valueless; but for every storm there were the logs and reports of several vessels at different distances from each other; and so the means was in existence of finding, as to particular storms, how far they spread, at what hours they reached particular latitudes and longitudes, and the precise direction and fury of the wind, and state of the sea with every ship. Mr Redfield, of New York, and Col. Reid, at Barbadoes, set to work upon the logs of ships in the Atlantic; and Mr. Piddington, by instruction of the East India Company, at the suggestion of Col. Reid, upon those in the Indian Ocean. The date of a particular storm was taken, the place of ship after ship as it was traced marked upon the map for every day, with arrows showing the direction of the wind: the storm's track was, in fact, mapped down, not from any ingenious imaginings, but from absolute note of it as it blew; and as the course of storm after storm was drawn, the fact showed itself, that these hurricanes had one and all been vast whirlwinds of from 500 to 1500 miles diameter, whirling, when south of the equator, as the hands of a watch move, and, when north of the equator, in the opposite direction: that in the northern hemisphere the hurricanes spring up about lat. 15 deg., and, in addition to their whirl, drive on toward the north-west to lat. 25 or 30 deg., where they slacken speed, make a curve in their direction, and then drive toward the north-east with all their former fury, until they die off between lat. 50 and 55 deg. (the direction of the whirl on each side of the equator is shown in the diagram engraved on the next page; that in the southern hemisphere they rise at the same distance from the equator, move south-west to about 50 degrees south latitude, and then curving, take a south-east course; that the danger of a hurricane arose from the force of the wind in the whirl, and not from its onward motion, which seldom exceeded from 15 to 20 miles an hour. We have not space to give at further length an account of these laborious investigations. It would not be easy to over-estimate their importance. Colonel Reid has not merely laid the result of the inquiries before the world in his two valuable works on the "Law of Storms," but has shown that the knowledge of the law is power to disarm the hurricane of its terrors, by giving plain directions to seamen for finding out when they are near a hurricane, whether the ship be overtaking the storm or

LIEUTENANT-COLONEL REID, R.E., GOVERNOR OF MALTA, AND CHAIRMAN OF THE EXECUTIVE COMMITTEE OF THE GREAT EXHIBITION

the storm the ship; if in the hurricane, whether they are near the centre or the outer edge; and whether they are in the van, the rear, or at which side, and how the ship in each case should be managed.

The pamphlet by which our attention has been called to the subject is the beginning of the very thing that of all others was wanted to enforce upon all sea-going men the duty of a thorough understanding of the law of storms. Here we have a log-book narrative of the *Blenheim*, Capt. Robert Methven, homeward bound from India, with notes on the log and projections of the hurricane made at the time. Let this example be followed by other commanders, and the result will be such a mass of evidence in proof that by this new system a commander can save his ship from hurricanes, sail safely in their company, and even speed him on his voyage by their help, that the law of storms must at once be made a subject of thorough examination of captains presenting themselves for first-class certificates. Those who are to be entrusted with life and property in hurricane-beset seas can be held but ill fitted for their office if the hurricane be still a mystery, and the ship's safety a chance with them. Capt. Methven had mastered this matter of seamanship. A frontispiece to the Narrative shows his ship standing south under a press of sail, with the conviction, founded upon his study of Col. Reid's law of storms, and which the result *proved* correct, that he should thus pass out of the storm. The entire narrative is full of interest; he several times entered and came out of the hurricane, lay to to avoid it, and finally, having reached lat. S. 25, waited for the hurricane to take its south-eastward course and leave him a clear sea, on which, with a prosperous wind, and without damage of any kind from a storm by which several other ships were severe sufferers, he sailed on to the Cape. The interest of the account is increased by the fact that in the Transept of the Exhibition is to be found on the stand of the model of the *Queen* (110), the main topsail of the *Trafalgar* blown to ribbons, and twisted into a plait in this same hurricane, in lat. 25, where the *Blenheim* lay to, waiting on the recurving of the storm, at eight in the morning of the 22nd. At three on the same morning, Captain Methven, who knew that his ship was fast overtaking the E.N.E. verge of the whirlwind hurricane, which by standing south he had cleared on the 19th, called up his crew to close reef topsails, with the remark, "Look sharp, or in half an hour you will have nothing but the bolt rope at your yards." Other vessels were severe sufferers: the *Anne Laing*, on the 21st, was thrown on her beam ends, lost foremast, jibboom, galley, boats, binnacle, wheel, and all the port bulwarks, stanchions, &c.; the poop deck was stove in, one of the beams broken, the cabin and forecastle completely filled with water, and a man washed overboard and drowned. On the same day the *Sydney Griffiths* lost top-gallant-masts, mizen-topmast, jibboom, and badly sprung her bowsprit; the *Washington* was thrown on her beam-ends, and lost masts, sails, and rigging. The *Blythswood* suffered so severely between the 20th and 23rd, that, having had everything blown away, her rudder-stock broken, several of the crew severely injured, and the carpenter dead of his wounds, the crew were obliged to desert her. There were numerous other disasters, but these are sufficient to show the importance of a knowledge of the law of storms. There was no lack of able seamanship on the part of the commanders of these disabled ships, save that they did not know how to get out of the hurricane. On the 26th, another hurricane sprang up, and three vessels were at all events saved all injury—the *Catherine Apear*, Capt. Fowler, the *Jules*, Capt. Thuillier, and the *Josephine Loiseau*, Capt. Laburg—by their captains having hove to, and allowed, the storm to drive past. "I feel confident," says Capt. Fowler, "that this simple manœuvre of heaving to at a proper time saved the ship under my command from suffering any damage, and the 340 souls on board from meeting any accident." There is no need to say more to convince of the importance of the subject.

Our Engraving represents H.M.S. *Meander* in a williwa in the Straits of Magellan—a species of hurricane squalls, the laws of which, as well as that of the white squalls of the Mediterranean, remain to be investigated. There can be no doubt, however, that they have a law, and which Colonel Reid's appointment to the Governorship of Malta will enable him, by inquiries on the spot, to develope.

The following are the details of the *Meander* storm, by the Artist, who was a passenger in the vessel:

"Her Majesty's ship *Meander* (just returned from the coast of South America) came through the Straits, and is the largest sailing vessel which has made the passage. During her passage through, the *Meander* experienced several of those violent squalls, known as 'williwaws,' or hurricane squalls—gusts which come rushing down the steep sides of the mountains, and burst out from the valleys with incredible fury From a light air, scarcely sufficient to give a vessel steerage way, or a perfect calm, the water in an instant becomes torn up and driven forwards into a sheet of foam, which is caught off and goes away in a cloud of mist along the surface to leeward, the gust at times becoming subdivided into a number of small whirlwinds, each a miniature typhoon with a centre of its own, travelling rapidly forward, and carrying with it a column of white vapour. While this is occurring in one part, in another place, not far off, the water will be seen perfectly calm and undisturbed

In these puffs, a vessel, with scarcely a moment's warning, is on her broadside, every sail strained to bursting, yards bending, topmasts straining over to leeward, and threatening every instant to go over the side. In a squall of this kind, which caught the *Meander*, her foresail was split literally to ribbons, the mizen-topsail sheet going at the same time. They pass over quickly, leaving the vessel, perhaps half a wreck, to make the best of her disaster, and repair damages in the calm and sunshine which generally follow.

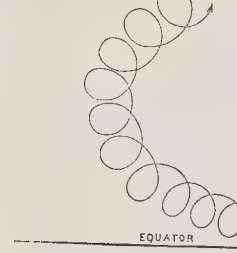
The *Meander* entered the Straits of Magellan, from the Pacific, on the western side, May 13th; coming out into the Atlantic, by the eastern opening, on the 23d of same month, making nine days in the Straits, exclusive of the day of entering and leaving. She anchored every night, the days being very short.

"*Direction of Williwaws.*—These squalls appear to be very much influenced in their direction by the form and position of the valleys upon which they descend from the higher land behind. This effect upon the

HER MAJESTY'S SHIP "MEANDER" IN A SQUALL, IN THE STRAITS OF MAGELLAN.

* Narratives written by Sea-Commanders, illustrative of the Law of Storms, and of its Practical Application to Navigation. No. 1. The Blenheim's Hurricane of March, 1851; with some observations on the South-East Trade Wind, by Capt. Robert Methven. Weale, High Holborn.

direction of wind from the form of land was also apparent in the more steady breezes blowing through the Straits, when rounding Cape Froward, the most southern point of Patagonia: the wind, which had been at W., drew right round after us to S.W., the only alteration in sail, as we turned again to the northward, being in shifting over the studding-sails."



DIAGRAM, SHOWING THE WHIRL OF A HURRICANE ON EITHER SIDE OF THE EQUATOR.

Lord Palmerston has addressed the following letter on this important subject to the various British Consuls abroad—a similar one having been dispatched from the Colonial Office—requesting their co-operation in obtaining information relative to atmospheric phenomena connected with storms and hurricanes:—

SIR,—I transmit to you copies of a letter, with its inclosures, which I have received from Colonel Reid, of the Royal Engineers, who for many years has devoted his attention to the theory of storms, and whose object has been to investigate, with a view to practical use in navigation, the law by which storms and variable winds are governed. In order that an investigation of this nature may be practically useful, it is essential that facts connected with the atmospherical phenomena in question should be carefully observed and accurately recorded over as large a portion as possible of the surface of the globe by persons of education, and whose scientific attainments or professional avocations qualify them for making such observations. Colonel Reid has suggested that such observations can be easily made and recorded by captains of ports, masters of lighthouses, harbour-masters, and others, whose professional pursuits naturally lead them to be constant observers of atmospherical phenomena. The inclosures in Colonel Reid's letter will more fully point out the manner in which information on the subject of storms may be collected. I have accordingly to instruct you to use your best endeavours to procure such information on this important subject, and you will transmit to me half-yearly an abstract of the information you may have obtained, with such remarks as may suggest themselves to you. If you can add diagrams to show the tracks of any remarkable storms, it would greatly add to the value of your reports. As it is of importance to ascertain as widely as possible information as to storm tracks, you should encourage the publication of such information in newspapers and periodical works. I am, sir, your most obedient humble servant,

PALMERSTON.

LIEUTENANT-COLONEL REID, R.E.

LIEUTENANT-COLONEL WILLIAM REID, eldest son of the Rev. James Reid, a clergyman of the Scotch Church at Kinglassie, in Fifeshire, was born at that place, within four or five mile of the birth-place of Adam Smith, in 1791, and brought up at Woolwich Academy, for the corps of Engineers; he entered the army in 1809, and served during the last four years of the war in the Peninsula under the Duke of Wellington. After the conclusion of the Peace, he served on the coast of America, under General Lambert, until the conclusion of the war there, and rejoined the Duke of Wellington again in Belgium in 1815. In 1816 he served in the expedition against Algiers; was afterwards of the corps of Sappers for some years after the Peace; in 1838 was appointed to the governorship of the Bermudas; and, in 1846, of the Windward West India Islands, and in both was fortunate enough, by the firm and impartial exercise of power to gain the confidence and goodwill of the entire population. On his arrival in Bermuda, in 1839, he found agriculture far behind; corn and hay were imported; there was but little fruit—bitter citron trees grew everywhere; and in sight of Government House was a wide swamp. Colonel Reid set the example of improvement. He grafted a sweet orange on a bitter citron tree, in front of the Government House; it bore good fruit, and soon all the bitter trees were grafted. He drained the swamp, imported ploughs, had ploughing taught, gave prizes for best productions; and in 1841 held a grand agricultural fête in a fine dry meadow field—like old swamp. In fact, he gave new spirit to the people, showed them how to work out their own prosperity, changed the face of the island, and won the title of the Good Governor, by which he is still affectionately remembered in Bermuda. In 1846 he returned to England, and in 1849 was appointed Commanding Engineer at Woolwich, an appointment which he now holds, and commands the Engineer officers and Sappers and Miners at the Exhibition; and, on the resignation of Mr. Robert Stephenson, Colonel Reid was requested by the Royal Commission to become in his room Chairman of the Executive Committee, upon which he has throughout served with unremitting attention.

But, though extending both in peace and war, in civil and military capacities, over more than forty years, the public services of Colonel Reid bear no comparison to those he has rendered by his investigation of the facts developing the laws of hurricanes and storms in the Atlantic, Pacific, and Indian Oceans

We have felt it our duty, in the preceding page, to give some idea of the labours of Colonel Reid, not merely in justice to him, but in the hope of having the law of storms made a subject of examination of captains by the navigation department of the Board of Trade for first class certificates, as it already forms an item of instruction at the Greenwich Royal Naval School. It is no small matter, and were well worthy the labour of a life, to have disarmed, as Colonel Reid has done, this scourge of the ocean of its terrors. In his last work, published at Weales', High Holborn, in 1849, and entitled "The Process of the Development of the Law of Storms and the variable Winds, with the practical application of the subject to navigation," he has laid down plain rules for sailing in perfect safety as to hurricanes, so that in truth he may be said to have enabled man, even on the great deeps, to laugh at the tempest; it passes him as a bound game—the power of knowledge has conquered even the hurricane. The mariner, warned by his prophet barometer, can watch its coming, touch it as it passes, use its outer winds as favouring breezes, sail with it, into it, past it, gaze upon its vivid lightnings, listen with wonder to its thunder roar and howling whirl, and, as it dies away mowning in the distance, sail on unharmed.

A third edition of the "Development," was published by Colonel Reid last year.

In the present month Colonel Reid has been appointed to the Governorship of Malta. The appointment was given without his having had the least idea of the intention; but he deserves it for the character he won when Governor of the Bermudas, and the lasting service he has rendered to all sea-goers.

Our portrait is from a Daguerréotype taken at Bermuda.

CHESS.

TO CORRESPONDENTS.

H R, Ashford—We repeat that two Knights and a King only cannot effect Mate against the proper defence. The position you give is one that can never be forced, if the solitary King is moved correctly. As to the drives for space, that is a matter of signatures by the latter.

C F A, Weymouth—The problem in question must have miscarried

BATTER—The solution of Enigma No. 675 is 1 R to Q B 5th. 2. B to K B 6th 3 T to Q B 8th. 4. R to K B 4 Mate. The other text were

J B, Northwood—I You are nearly, but not quite, correct. 2. Problems of every kind are received for the publication mention of

PHILALETHES—It shall be re-worn and

H M—Problems so carefully constructed as yours are quite valueless. What is to prevent White making on the second move the end of the fourth?

G H F Dublin—A very pretty little problem.

INVISION—We have a horror of all "first attempts" in problem making, they are usually as bad as first attempts at verse making.

PRESIDENT, North Briton—We are led to understand that it is the intent on of Mr Löwenthal, the well-known Hungarian player, upon the one month of the Tournament matches, to make a professional tour through the principal cities of the northern and central provinces. Can you not avail yourself of his services to give eclat to the opening of your club? In addition to his play as a consultation as a problem master of the game. Mr Löwenthal is entitled to sympathy for his sacrifice of home and family and fortune in the late war a struggle for Hungarian independence, and we sincerely hope he accompanied "progress" will be attended by the success which in every respect he deserves. Address to 5, St George's Chess Club, Cavendish-square

EACHEM—Major Jaenisch's "Analyse Nouvelle des Ouvertures du Jeu des Echecs." We were in error in appears, in stating that this admirable work sold for 12s. Messrs Williams and Norgate inform us that the price of the two volumes is only 9s

F G R Peterborough—Tickets for the Lincolnshire meeting of chess-players can be had of the Rev. Rev. A B Sapperton, Esq. of Lavenor

SOLUTION TO PROBLEM No 399, by L D, M T S, Mungo, Phiz, Virginia, Emsworth, S J A, and Jo

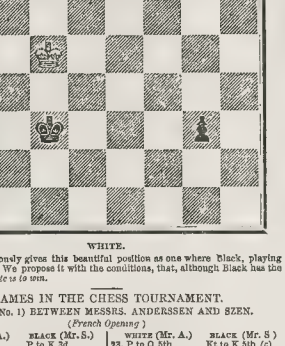
BLACK.



WHITE.

Cozio erroneously gives this beautiful position as one where Black, playing first, can win. We propose it with the conditions, that, although Black has the first move, *White is to win.*

GAMES IN THE CHESS TOURNAMENT.

GAME (No. 1) BETWEEN MESSRS. ANDERSSEN AND SZEN.

(French Opening.)

WHITE (Mr. A.)	BLACK (Mr. S.)	WHITE (Mr. A.)	BLACK (Mr. S.)
1. P to K 4th	P to K 3d	23. P to Q 5th	Kt to K 5th (c)
2. P to Q 4th	P to Q 4th	24. R to Q 4th	P to K B 3d
3 P takes P	P takes P	25. K R to Q sq	Q to K B 4th
4 P to Q B 4th	B to Q Kt 5th (ch)	26. P to Q 6th (dis	h to R sq
5. Kt to Q B 3d	Q to K 2d (ch)	ch)	
6. B to K 3d	Kt to K B 3d	27. P to K B 3d	Kt to Kt 4th
7 P to K R 3d	B to K 3d	28. R to Q 5th	Q to K B 5th
8. Q to Kt 3d	P takes P (a)	29. Q to B 3d	Q to K 6th
9. B takes P	B takes B	30. K to R square	R to K 5th (ch, d)
10. Q takes Q B	P to Q B 3d	31. R takes R	Q takes R (ch)
11. Kt to K B 3d	Q Kt to Q 2d	32. K to R 3d	Q to K sq
12. Castles on K side	Castles on K side	33. Q to B 7th	R to Q 2d
13. Q R to K sq	Q to Q 3d	34. Q to B 5th	Q to K 3d (e)
14. K Kt to K 5th	B to K 4th	35. Q takes K P	Kt to B 3d
15. P takes B	Kt to Q 4th	36. B to R 3d	K to R 2d
16. B to B sq	K R to K sq	37. Q to Q 3d (ch)	P to Kt 3d
17. Kt takes Kt	Q takes Kt	38. P to R 4th	P to B 4th
18. Q to Kt 3d (b)	P to K R 3d	39. B to Kt 2d	Kt to Q sq
19. P to Q B 4th	Kt to K B 2d	40. Q to Q B 3d	P to Kt 4th
20. R to Q sq	Q R to Q sq	41. It takes B P	Q to Kt sq
21. B to Q Kt 2d	P to Q Kt 4th	42. R to K 8th	Resigns
22. P takes P	P takes P		

(a) Castling would have been a better play, we believe. By taking the Pawn, Black brings the adverse Bishop into immediate action.

(b) Intending to attack the Kt with the Q P.

(c) If Black had taken the Pawn, the following variation would probably have occurred:—

WHITE.	BLACK.	WHITE.	BLACK.
23.	K takes Q P	25. R takes Kt	Q takes R
24. Q to K Kt 3d	P to K Kt 3d	26 Q to her B 3d	K to B sq

White may now recover the lost "exchange;" but in other respects the game would be about even.

(d) Upon the conclusion of the contest, it was suggested by several players who were watching this interesting game, that Mr Szen should have taken the Hook's Pawn with the Kt, when the game would have been continued thus:—

WHITE.	BLACK.	WHITE.	BLACK
26	Kt takes K R P	27 K to Kt sq	Q to Kt 6th (ch) &c
31. P takes Kt	Q takes R P (ch)	(If Q be intercepted, Black exchanges Queens, and then checks on K 7th with his Rook, winning the Bishop.)	

Mr Andersson, however, in reply, observed that had Mr Szen taken his R Pawn he should not have taken the Kt, but have played P to Q 7th, with a won game. The proper play for Black in the above position, we think, was to take the K B Pawn with his Kt. This compels the variation suggested, and gives Black an undoubted advantage.

(e) Instead of this move, we should have been disposed to take the K B Pawn, checking. If White then took the Kt, Black would have drawn apparently; and, if he played his K to Kt 3d, the Kt might be withdrawn to Kt 4th again, threatening to win the Q Pawn with a check presently.

CHESS ENIGMAS.

GREAT CHESS GATHERING.—The grand gathering of the Chess-players of Lisco mbire is definitively settled to take place at Calstor, on Thursday, the 9th of October. The play will begin at ten A M, and a dinner will be provided in the evening, at which the President of the Calstor Chess Club will preside. As invitations have already been accepted by Mr. Staunton, Mr. Newbarn, Herr Löwenthal, and other eminent players, and the amateurs from the neighbouring counties are confidently expected to attend, a splendid assemblage is anticipated.

THE GREAT EXHIBITION.

THE closing of the Crystal Palace, and the distribution of its contents, bids fair to create a great sensation amongst the middle and working classes of the provinces as the opening certainly did amongst those of the higher grades of society in London. On Monday the returns showed nearly 60,000 admissions, and on Tuesday 60,310 persons entered the Building. These are always the two great days as to numbers, but we think it likely that the other shilling days will equal them, as on Wednesday the numbers were 54,442, and Thursday realised 57,109. Even the half-crown days are looking up: for on Saturday last 17,366 visitors were present: at any rate, there is no falling off on those days, which, comparatively speaking, are exclusive ones

One singular evidence of the desire to see the wonders of the Exhibition, even in those least likely to be influenced by imaginative curiosity, transpired during the past week. An old fisherwoman, eighty-four years of age, came all the way from Cornwall on foot and presented herself at the Building on Monday, having been five weeks on her journey. Her appearance, which is that of a hearty and hearty looking person, attracted a good deal of attention, and she appeared to examine the wonders around her, particularly in the French department, with great attention and satisfaction.

The police were employed during the early part of last week by the abstraction of two waistcoat-pieces from nearly the same locality, on different days, and nearly the same time, although the first robbery put every one in the department on the *qui vive*. In a different part of the Exhibition a German was detected in stealing a packet of chocolate, and on searching his lodging, no less than seven articles, all stolen from the Exhibition, were found, and one of the missing vestings, amongst them. His conviction quickly followed by conviction at the Central Criminal Court, on Monday; he was sentenced to six months imprisonment. It is a remarkable fact, that the robberies which have taken place in the Building during the Exhibition, have been either by country thieves or foreigners. The London fraternity seem to avoid the place; or, if they do, cease to ply their vocation, as they are well aware of the character of the arrangements for their detection.

Amongst the newest contributions, which, strange to say, even at this late period, continue to present themselves, the very elegant and artistic example of gothic furniture, made from the finest California wood, and exhibited in the United States department, has attracted much attention. This is intended for presentation to Mr. Collins, of the city of New York, as a testimonial for his exertions in promoting steam navigation. Some months ago, the material of which these articles are made was at the "diggings" whence it was brought and worked up, without delay, by Messrs. Bull, Tomkins, and Black, of New York; and there are few things of the kind in the Exhibition, in which such precious and costly woods have been displayed. There is, however, another addition, which, we fear, will not attract the attention it deserves. This is an example of Brussels velvet pile carpet, woven upon an entirely new principle, discovered by a working man of Kidderminster, and now patented and exhibited by his employer, Mr. Lawcett, of the town; and had this specimen been in the Exhibition at an earlier period, there can be no doubt but that it would have been entitled to the highest reward the juries could have given. As it is, it appears in full meant of the conditions of a prize of one hundred guineas offered by Mr. Simeon Lea, of Astley Hall, Shipport, formerly an extensive carpet manufacturer at Kidderminster, who, anxious to promote the welfare of his native town, and desirous that it should do something worthy of its old reputation, advertised to the working men, when the Great Exhibition was first proposed, that he would give the above-named sum to any one of them who should make such an improvement in existing methods of making carpets as should be pronounced by competent persons as calculated to benefit the carpet trade in general, and that of Kidderminster in particular, the invention or discovery to be exhibited at the great industrial gathering of 1851. Nothing came of this in sufficient time, but no doubt the attempt which has resulted in the present invention arose out of this munificent offer, for in due time the claim was preferred to Mr. Lea; and as in everything else but the question of time that gentleman considered the inventor had a claim upon him, or rather upon the sum of money for which, with an addition, he had already invested in the public funds for a similar purpose at any future time, he therefore proceeded, first to obtain the admission of the specimen produced to the Exhibition, which under the circumstances was readily granted, and then to select a jury of competent persons to decide upon the merits of the method by which it was produced, as displayed in the result. The selection was thrown upon Mr. Samuel Lea, because upon the authorities of the Exhibition could in no way recognise the contribution in a competitive sense. The gentlemen appointed, however, unanimously adjudged that the conditions had been fulfilled, that the invention was a most valuable one and the method quite new, and that the weaver, Alfred Beach, was duly entitled to the offered prize. The description of the *modus operandi* would be too technical here, but it is sufficient to say, that, instead of six-seventhes of the wool used in the make of a carpet of the kind exhibited being buried, so to speak, in the fabric, this quantity, or nearly so, is brought to the surface, and an equally rich and wearable carpet is manufactured with one-half the usual quantity of wool, and at less than one-half the cost. It will be perceived, therefore, that this is a most important invention in the carpet trade: and yet the wonder is that it has never been done before, so simple is the arrangement of the loom, and the mechanism. It can be called such, comparatively speaking, only in the new mode of production. This is one amongst many other instances of distinct benefits to particular localities arising out of the Exhibition. We shall give another next week.

An interesting experiment was recently carried out upon the beam formed of hollow bricks, which has been exhibited by Messrs. Baxley, of Nine Elms, since the opening of the Exhibition, at the west end, with an announcement that the breaking weight would be given in the course. After loading it to the full extent of the materials provided, and no symptoms of giving way having been observed, the conclusion of the trial was postponed until Monday, when upon the beam being examined, the beam was weighted up to 67,800 lb., when it broke in the centre. Some of the bars of iron placed within were broken, and others were drawn. The fracture, however, was a vertical one, and the strength of the construction was considered at this stage of a doubt. It is somewhat singular that hollow bricks are still used in North Africa, and that it was intended to have sent specimens from Tunis. The Romans, too, used them largely in many structures; but the most interesting one, and proves highly satisfactory to those best capable of forming a correct judgment who were present, amongst whom were Major-General Pasley, Professor Ansted, and Mr. George Godwin.

Another and most sensible proposition as to the disposal of the surplus proceeds of the Great Exhibition has emanated from Bolton, a town which distinguished itself by much earnest painstaking in the preparation of specimens of the staple products of the neighbourhood. The resolutions moved and carried at a meeting of the local committee on the 17th inst (Mr. Robert Heywood being in the chair) are so complete in themselves, that we cannot do better than place them on record, containing, as they certainly do, suggestions of great value. They are as follows:—

1st. That her Majesty's Commissioners be urgently and respectfully requested to express and record the warm feelings of gratitude and admiration universally entertained towards his Royal Highness Prince Albert, by the erection of a column and statue of the Prince as President of the Royal Commissioners, in bronze or other metal, and in civil costume, with a suitable inscription either in the centre of the space now occupied by the Crystal Palace, or in some other appropriate situation.

2nd. That the Royal Commissioners and the Executive be respectfully requested, in the event of the removal of the Crystal Palace, or as the Committee would greatly regret), to purchase as much of its materials as may be required for the erection or building in one or other of the new parks for the people, or some other convenient situation, adapted to receive the pictures, models, sculpture, carvings, printed books, manuscripts, and other documents relative to the Exhibition, which it may be thought desirable to preserve for the use of the nation. That admission to the said building should, under suitable regulations, be free to the public and that a model of the Great Hall of the Great Exhibition of the present year may be required for the necessary expenses of keeping the said building in repair, and for moderate admission to the same, should be required for that purpose.

3d. That her Majesty's Commissioners for the Great Industrial Exhibition be respectfully requested to select from the Jurors' Reports, and from the Reports of the Royal Commissioners, such as may be considered worthy of being permanently recorded, recording the date of the opening and closing of the Exhibition, the year of our Lord and the reign of Victoria, its purposes and objects, the names of the Presidents and members of the Royal Commission, of the Executive Committee and principal officers; the designer of and contractors for the Building, the number of visitors, and the amount received for admission, which, from other sources, is one of the considerations of interest to the contributors; and that it be further suggested that an impartial history be made or commissioned as the basis of statistic information of the four great divisions of the Exhibition, or of the best evidence which how can be obtained to it.

Such propositions as these deserve careful consideration in many respects, and the monument proposed to Prince Albert is both more appropriate to modern notions, and certainly more attainable, than that of Cleopatra's Needle, which was gravely announced some time ago as fitting monument to record the Industrial *Fête* of 1851, particularly as the peculiar allusion to the fact, that, as a needle, it was said very appropriate.

The goods in the Turkish and Tunis departments of the Exhibition are to be sold during the next three weeks, or re-shipped for Constantinople. The prices can be learned of Mr. Major, at the Building.

SELF-ACTING SPRING PRESSURE SPECTACLES.—This improvement, patented by F. B. Anderson, Gravesend, consists in the temples (side pieces) being fitted with convolute springs, so as to fit closely when worn, and thus secure correct vision, by keeping the spectacles at an uniform distance from the eyes. When removed, they immediately fold themselves up, and can be worn attached to a guard round the neck, as an eye-glass. The case insured to the wearer by this simple improvement must give these spectacles a decided advantage over those of the old construction.

THE LOSS OF THE "PACHA" STEAMER.—The unfortunate accident which has deprived the Peninsular and Oriental Company of the service of this steamer, will not, we are informed, cause any interruption to the important line of steam communication recently established by the company between Calcutta, Penang, Singapore, and China. The company's steamer *Pekin*, of 1200 tons and 450 horse-power, was some time since ordered to proceed from Bombay (where she would be superseded by the *Ganges*, new steamer) to Calcutta, from which port the *Pekin* and the *Ava* will maintain a monthly communication with Penang, Singapore, Hong-kong, and Shanghae. The *Pacha* was intended to open a communication between Hong-Kong and Manilla, and, although that measure will be necessarily delayed for a short time by her loss, the line will soon be opened by another vessel. The India and China station is to be further reinforced by the *Shanghae* and *Chusan*, new screw steamers. The former was despatched from London on Thursday, and the latter will start in a few weeks hence, to take up their stations.

EPITOME OF NEWS—FOREIGN AND DOMESTIC.

Lord Cranworth and Vice-Chancellor Knight Bruce will be Lords Justices in the Court of Appeal under the new act. Their successors as Vice-Chancellors are not yet named.

Mr. Birch has resigned the situation of preceptor to the Prince of Wales. He is to be succeeded in his office by Mr. Gibbs, barrister-at-law, and Fellow of Trinity College, Cambridge.

It is expected that Lord Gormanstown and Lord Ffrench will be appointed to fill up the ribands vacant in the Order of St. Patrick by the decease of Lords Clare and Donoughmore.

A seat is vacant at the Board of Charitable Donations and Bequests (Ireland) by the death of the late Earl of Donoughmore.

Mr. Charles Grey, of Dolaton, is appointed agent to Earl Derby's estate, county Tipperary

On Wednesday afternoon (last week), a pedestrian, named T. S. Gibson, commenced the performance of a feat, at Edinburgh, similar to that recently accomplished at Sheffield by Manks. The match is, to walk 1000 successive half-miles in 1000 successive half-hours, 1000 miles in 1000 hours, and 1000 quarter-miles in 1000 quarter hours, for the sum of £100 a side. The ground is measured off in small gardens at Restalrig, near Jock's Lodge, fourteen circuits of which are equal to one mile. Gibson is about 22 years of age, of the middle size, and muscular; and many, who have seen him, entertain a favourable opinion of his ability to execute the arduous task.

Her Majesty has granted a pension of £100 a year on the civil list to the family of the late Rev. James Saxton Reid, D.D., Professor of Church History in Glasgow, and author of "The History of Presbyterianism in Ireland," besides other works on theology.

A return just issued shows that in the united parishes of St. George the Martyr, and St. Andrew's, Holborn, the number of paupers relieved out-door relief is 293; at the same period last year it was 4248; there are in-door poor 556. At the same period last year there were 588, and, in 1849, there were 1190, being a decrease of nearly one-half in two years.

A considerable portion of the pier at the eastern entrance of the West India Dock has fallen in, completely barring the passage against the entrance or exit of shipping; the vessels are, in consequence, taken into the East India Docks.

The sporting stakes regularly given each year on all the race-courses of France are 468 in number, and amount to 725,000f.

Lord John Russell, wholly unsolicited, has appointed Mr. James Brotherton, barrister-at-law, and son of Joseph Brotherton, Esq., M.P., to the office of Receiver-General in the Inland Revenue Department.

The Hon. Julian Fane, *attaché* to her Majesty's mission at Berlin, is transferred to the mission at Vienna in the same capacity.

William Walker, Esq., Government Secretary of British Guiana, is appointed Lieutenant-Governor of that colony in the event of the death or during the absence of the Governor.

The large organ in the Great Exhibition, built by Willis of London, has, we are informed, been purchased for £500 for the Wesleyan Chapel, Pitt-street, Barnsley.

A balloon, without the aëronaut, descended a few days since in Mecklenburg. It has been ascertained that it belonged to a person named Tittel, who made an ascent at Copenhagen. After landing a lady and a child from the car, the machine rose rapidly from a place called Amack, at Copenhagen, and the aëronaut was never seen again. It is supposed he perished in the Baltic, as the balloon must have crossed the sea.

The cholera, which for the last two years has visited Prague, the capital of Bohemia, for four months, has unhappily re-appeared this month (September) with extraordinary virulence, especially in the heart of the city and in the Jews' quarter. The hospitals are full. Death generally takes place a few hours after the first attack.

The statue of an idol in stone, coarsely executed, but supposed to date from the period of the Phœnicians or Carthaginians, was found about a fortnight since among the ruins of the town of the old Arzew, in Algeria.

We read in the *Aërienne*:—M. Proudhon, at his own request, has quitted the Conciergerie for St.-Pélagie. And then those of every one of the newspapers which are in the habit of publishing the addresses of publishers, printers, and contributors, and even the names of the servants, were in a state of consternation. Each one ran to the office of the publication to which he belonged, and asked, "Is my name in the list?" Then, when he had packed up his books and papers, two police agents came to inquire how he would like to remove? "Ah, you are coming with me?" asked M. Proudhon. They replied in the affirmative. "Very well," said M. Proudhon, "we will walk;" and the honourable Socialist went through Paris between the two agents.

Efforts are now on foot in Boston and its vicinity to collect funds towards the erection of a bronze statue of Dr. Jenner, in London, in honour of his great discovery of vaccination.

Return showing average wages of mechanics and others in South Australia, for quarter ending 31st December, 1850:—Blacksmiths, 9s. per day, without board or lodging; bricklayers, 7s. to 7s. 6d., ditto; brickmakers, per 1000, 16s. to 18s., ditto; carriage makers, 7s. per day, ditto; coopers, 6s. to 7s., ditto; day labourers, 4s per day, ditto; wheelwrights, 6s. to 6s. 6d., ditto; miners, tributers, according to agreement; boys, 6d. to 1s., with board and lodging; ditto, 5s. to 9s. per day, without board or lodging.

As a party of Sligo gentlemen were yatching in the early part of the week, in the bays of Sligo and Donegal, they met a number of what appeared to be fishing craft. They were of vast dimensions, and at one time no less than six appeared above water, one of at least sixty feet in length being within fifty yards of the *Venture*, the yacht which the party were in. It is supposed the whale fishery on the Sligo or Donegal coast, as there is no doubt but that large numbers of those valuable leviathans of the deep visit the western and north-western shores.

The Government census, which was begun in 1817, is not yet finished. It is to contain 258 sheets, of which 149 are already published. There yet remains five years' work in surveying, and nine years' work in engraving, to be done. The total cost will exceed £400,000 sterling. Up to the time 149 staff officers have been employed in the work.

The Comte de Chambord is about to visit Ems. He will pass the winter at Venice.

The salmon fishings north of the Tweed closed on Saturday last. The season, generally speaking, has been of a mingled character, and compin ns are, as usual, pretty general.

A man at Glasgow, who carried on a brisk trade in rotten eggs, boiled them, and sold dealers under the pretext of using them in the manufacture of blacking, and then giving them a beautiful white appearance by means of chemicals, which would impose upon even a Scotch wife, has been fined £16, for practising or exposing a cheat.

The manners between Greenock and Londonderry are charging only 1s per head.

On Sunday night, Mr. Williams, of Gosnell-street, was attacked in Old street-road, Shoreditch, by ruffians, who placed an instrument round his neck, and squeezed him so tightly that he became insensible, and whilst in that state took from his pockets a £40 and a £30 Bank of England promissory note, 7s. in gold, and 5s. in silver, afterwards getting clear away with their booty. Mr. Williams is only able to describe one of his assailants, a young man about 25, fair complexion, and wearing black clothes.

The Warwickshire hounds have been cub-hunting on the southern side of the county during the last three weeks, and an abundance of foxes have been found. The hounds will be brought to the Leamington kennels this day, and cub-hunting will take place on the northern side of the county during the ensuing month.

On Monday information was received by the metropolitan police, that another convict, named James Ashley, had effected his escape from the *Justitia* hulk at Woolwich. He found means of procuring a disguise, as he left the convict side of the jetty behind him. Ashley was convicted of burglary, October 23, 1843, at the Central Criminal Court, and sentenced to ten years' transportation. He is well known in Hammersmith, Brentford, and Chiswick.

Serious inconvenience and a serious difference of opinion as to the proper way of spending the Sunday in Lancashire. The *Preston Chronicle* states that "the Botanical Society of Wigan held an exhibition of flowers on Sunday last;" and further states that "on Tuesday last two boys were fined 7s. each for bathing in the river on the preceding Sunday."

Sir Henry Bold Hoghton, Bart., the owner of Hoghton Tower, has given orders for the place to be closed to all large parties of visitors. We believe that Sir Henry has been compelled to adopt this course from the damage done to the furniture and woodwork in the various apartments, by the great numbers of excursionists who have visited it by cheap trains from Manchester and other places.

The directors of the Electric Telegraph Company have received the report of their engineer, to the effect that the re-insulation of their lines upon the new principle patented by Mr. Edwin Clark is completed, and that they have determined forthwith to make a considerable reduction in their charges for the transmission of the messages of the public, and at the same time to simplify their tariff by making it as far as possible uniform.

The *Montreal Gazette* mentions that the flag of England was publicly burnt on the public square of that city when the news was received that the Queen had a grant the Ecclesiastical Titles Bill.

The chairman of the Montrose East India Fishing Company are stated to have taken a sword fish measuring 28 feet in length

The scheme for establishing steam communication between Preston and Liverpool, by water, is in a satisfactory state of progress.

A vessel arrived from New York this week at Liverpool has brought 14 000 packages of butter as a portion of her cargo, the produce of the United States of America. This is the largest importation of butter which has taken place from the United States.

The Commissioners of her Majesty's Customs have granted permission for all ships laden with timber from foreign parts to discharge their cargoes from six to six, instead of, as formerly, from eight in the morning until four in the afternoon; also, ships laden with deals and other wood goods, from seven in the morning until five in the afternoon, when discharging in any of the docks under charge of the revenue officers. This relaxation of rules will be of great benefit to the merchant and shipowner during the long days. In the winter months it is not required.

At the Glasgow Town Council, on Thursday week, the sum of £500 was voted for an equestrian statue of the Queen, in commemoration of her Majesty's visit to the city in August, 1849. The private subscription towards the same object already exceeds £3000, and the work will be commenced forthwith.

BLOOMERISM.—NEW COSTUME FOR LADIES.

THIS striking novelty originated with Mrs. Amelia Bloomer, who is the editor of a monthly journal, entitled "The Lily; a Ladies' Journal, devoted to Temperance and Literature," and published at Seneca Falls, N.Y. The accompanying portrait is copied from the September number of the *Lily*, where it is stated to be from a Daguerréotype, taken by T. W. Brown, Auburn, N.Y. Mrs. Bloomer considers it to be a very good representation of her new dress; though the artist has failed to show the trousers to as good advantage as she could wish; adds: "We are not ambitious to show our face to our readers; all we seek is to let them see just what an 'immodest' dress we are wearing, and about which people have made such an ado. We hope our lady readers will not be shocked at our 'masculine' appearance, or gentlemen mistake us for one of their own sex."

The *Lily* appears to be ostensibly devoted to the advocacy of the new fashion. The present number contains a paper on the subject by a physician of Boston, who calmly discusses the innovation. He replies to the objection on the score of delicacy, by reference to the Swiss costume, remarkable for its brevity of skirts; and to the picturesque dress of the Polish lady, with high fur-trimmed boots (the very things for American sloughs and sleds) and short tunic. But, to come nearer home, the lady writer asks:—"If delicacy requires that the skirt should be long, why do our ladies a dozen times a day commit the indelicacy of raising their dresses, which have already been sweeping the side walks, to prevent their dragging in the mud of the street. Surely a few spots of mud added to the refuse of the sidewalks on the hem of their garment, are not to be compared to the charge of indelicacy, to which the display they make might subject them."

In reply to the objection of unseating, it is maintained, that "the dress need have no masculine characteristics about it. The costume of the Polish ladies and the out-door dress of the Russians which, resembling each other very much, I should take as the proper types for our ladies to model their upon—has surely never been obnoxious to such a charge; whilst the Turkish women have always been considered, in *physique* and in costume, as the embodiment of all that is effeminate. The peculiarities of the new dress do not affect the clothing of the chest at all, and by no means require as essential to its perfection a waistcoat, standing dickey, cravat and sack, as many seem to think, at least, such is not the costume we argue for.

"Leaving the portion above the waist to the taste of the wearer, suggesting, however, that it should be much looser and less constraining to the motions of the arms and chest than it now is, we would have a skirt reaching down to nearly half way between the knee and the ankle, and not made quite so full as is the present fashion. Underneath this skirt, trousers moderately full, in fair, mild weather, coming down to the ankle—not instep—and there gathered in with an elastic band. The shoes or boots to suit the occasion. For winter, or wet weather, the trowsers also full, but coming down into a boot, which should rise some three or four inches at least above the ankle. This boot should be gracefull shaped in the upper cut, and trimmed with fur, or tastefully ornamented, according to the taste of the wearer. The material might be cloth, morocco, moosekin, &c, and water-proof, if desirable."

The writer then proceeds to the advantages of the new costume. It would be cheaper, there being less material required in it, both for comfort and elegance; and the wear would be much less, because this comes chiefly upon the lower part of the skirt. It would be more convenient, for one could go out in the weather on foot being so requisite as in the old dress; and the wardrobe need not be so bulky.

It is then maintained that the change would be conducive to health, by the avoidance of damp skirts hanging about the feet and ankles, since they would be clad in a best:—

"The material could be better adapted to the season. It could therefore be made cooler in summer, and warmer in winter, than at present. The *trousers* would be the *essential part of the habitual dress*; the skirt an addition for grace full shaped in the upper cut, and trimmed with fur, or tastefully ornamented, according to the taste of the wearer. The material might be cloth, morocco, moosekin, &c, and water-proof, if desirable."

The writer then proceeds to the advantages of the new costume. It would be cheaper, there being less material required in it, both for comfort and elegance; and the wear would be much less, because this comes chiefly upon the lower part of the skirt. It would be more convenient, for one could go out in the weather on foot being so requisite as in the old dress; and the wardrobe need not be so bulky.

It is then maintained that the change would be conducive to health, by the avoidance of damp skirts hanging about the feet and ankles, since they would be clad in a best:—

"The material could be better adapted to the season. It could therefore be made cooler in summer, and warmer in winter, than at present. The *trousers* would be the *essential part of the habitual dress*; the skirt an addition for grace and propriety. Comfort, therefore, would not require so frequent a change of this latter as is now necessary, while with the former, little trouble (and therefore not so liable to be neglected as now), muslin might give way to merino, or this to suit a momentary demand of out-door exercise or a change in the weather."

Lastly, for those who are about to become costume reformers, exemption is claimed from "the criticisms of every male who wears the present stove-pipe section hat, and-gaiter boots; and from those of every one of the sex who prefers in collecting the sweepings of the side-walk upon the hem of her dress, or who thinks it more delicate to display four-fifths of her stocking every time she crosses a gutter, to adopt a New Dress."

Of course there are alarmists upon this subject, as there were upon the safety of the Crystal Palace; and an old lady thus address-es Mrs. Bloomer:—"I must say that I have fears, that should the ladies of fifty or sixty years old adopt the new costume, it might operate as a damper on the good cause which you so ably advocate and so fearlessly adopt; and yet it does seem rather hard, that we, who have so long and so faithfully swept the streets with our side-walks, should be required to go still I fear perfectly submissive, and shall wait patiently for your advice, which please give through the columns of your beautiful *Lily*."

Mrs. Bloomer replies:—"Do just as your impulses move you to do. What you find a burthen in belief or apparel, cast off. Woman has always sacrificed her comfort to fashion. You old women of sixty have been slaves to the fashion long enough, and as you have but a few years to live, as far as I am concerned, as happy as you can and what time remains. Fit yourselves for a higher sphere, and cease grovelling in the dirt. Let there be no stain of earth upon your soul or appeal."

The agitation has already reached our metropolis. On the 15th and 22d, Mrs. C. H. Dexter delivered a lecture upon Bloomerism at the Literary Institution, Aldin-street, Fitzroy-square; the lecturer, of course, wearing the new attire, of black satin, consisting of a jacket, a skirt scarcely reaching to the knee, and a pair of very wide trousers, tied at the ankles. The illustrations were smart, and the advocacy specious; and Mrs. Dexter's reading from a few incidental examples were dropped in. For instance, Lord Shaftesbury, who, at Mrs Chisholm's group meeting of colonists, unfortunately introduced the topic of Bloomerism, in pursuit of a wife for a friend, "a good, quietly quoted; and, in a parenthesis, female emigrants were especially recommended not to import the error of drapery into the countries they intended to colonise.

THE BRUSSELS SEPTEMBER FETES.

(From our own Correspondent.)

BRUSSELS, Wednesday, 24th Sept.

We are, at the moment I write, in the midst of a series of national *fêtes* and rejoicings of no ordinary magnificence and gaiety. Of course, you are aware that every year for these twenty years past the good people of Brussels, indeed of Belgium, have been in the habit of commemorating the anniversaries of their Revolution; and that every year as their Constitution grows older, and they have fresh experience of its benefits, these *fêtes* increase in magnificence. The *fêtes* for this anniversary are in no respect unworthy the character of their predecessors; they rather present some new features worthy of notice.

I am not now going to give you any details of these festivities; the 61 must reserve until next week. This will both suit your day of publication, and give me time to select from the mass of amusing things now going on the materials for a connected narrative. The proceedings opened yesterday with a solemn funeral service in the Cathedral; then there was a review of between 20,000 and 30,000 troops on the Place Royale, by the King in person, in front of the Palace, at night, a grand procession, or flight of cavalry, through the principal streets, each soldier carrying a flambeau. This morning, a grand open air concert on the Place d'Anvers, opposite the Hôtel de Ville, which will be repeated every evening. To-night there will be a magnificent ball given by the chief artists and literary men to the King, in a building of immense size, erected and decorated in the form of a temple. To-morrow is the procession: to-morrow, balls and concerts all over the City; and, on Friday, a grand illumination. Add to these attractions, that the whole of Brussels is one mass of festoons and banners; that the crowds render the streets almost literally impassable—that strangers from all nations have flocked hither on the occasion—and you will say that the September *fêtes* of the present year have in nowise fallen off from their ancient reputation or attractiveness.

I should mention, that there is at Brussels at the present time a grand Fine Arts Exposition, to which some of the first artists in every branch of the Arts have contributed, and which throws a light on the condition of contemporary art, not merely in Belgium, but also in the neighbouring countries.

More of all these matters next week.

EMIGRATION TO THE UNITED STATES.—The following (says the *New York Tribune*) is a statement of the emigration into the port of New York for the last eight months, as compared with similar returns during the same period last year. It will be seen that the average since the month of April has been over 1000 per day:—

	1850.	1851.
January	13,154 ..	14 709
February	3,996 ..	8,170
March	5 569 ..	16,055
April	14 287 ..	27,770
May	42 845 ..	33,858
June	11,762 ..	34,402
July	34,466 ..	27 912
August	18,092 ..	30,951
Increase this year	143,709 .. 49,134	192,836

During the first week of September there were thirty-four emigrant arrivals from the following places in Europe.—

Antwerp	91	Glasgow	182
Bremen	725	Gottenburg	221
Bristol	23	Hamburg	337
Cardiff	23	Havre	869
Cork	347	Liverpool	3147
Dublin	210	London	894
Galway	153	Total	7238
Genoa	93		

MUSIC.

The Sacred Harmonic Society performed, under Costa's direction, Mendelssohn's "Elijah" last night; Mdme. Clara Novello, Misses Dolby and Williams, Messrs Sims Reeves, Whitehouse, and Herr Formes, being the principal vocalists.

Mr. W. Glover's "Emmanuel" was to be given at the Free Trade Hall, at Manchester, last night, under the composer's direction, with Mr. Seymour as leader of the band

An evening concert, under Mr. Albert Sobless's direction, took place on Monday evening, at the Lecture Hall, Greenwich, with Herr Kuhe, Herr schmit, and Mr. F Mori as conductors. Herr Jansa (violinist), M. Remusdet (violoncellist), and Miss Louisa Pyne, Miss S. Pyne, Miss Bassano, Miss Messent, Miss Binckes, the Misses Alexander, Mdme. Garcia, Signor Stigelli, Signor F. Roncori, Messrs Herberte and Whitworth.

The Lyrian Glee and Madrigal Union, which acquired such deserved popularity at Willis's Rooms, this season, will commence a provincial tour at Brighton, Hastings, and Tonbridge Wells, next week.

Meholi's "Joseph," originally produced at the Salle Favart, in 1807, has just been revived, with signal success, at the Théâtre de l'Opéra Comique, in Paris, with M. Roquier-Delaunay as *Joseph*; Bassine, *Jacob*; Coudere, *Simeon*; and Mdlle Lavoye, *Benjamin*. This biblical drama suggested to Rossini to compose the "Moïse," for the San Carlo, at Naples; and Auber conceived the notion of writing the "Enfant Prodigue," in consequence of his intense admiration for Mehul's dramatic oratorio, which is very popular in Germany. It has been properly mounted at the Opéra Comique, and was drawing immense houses. At the Grand Opera, Mdlle. Alboni is the star in Donizetti's "Favorita" and Meyerbeer's "Prophète."

Meyerbeer is recovering from his severe indisposition, at Boulogne sur-Mer, where the Countess Taccani-Tascana, who had retired from the stage some years since, has reappeared as *Lucia*.

The German papers recrue the great successes of Mdlle. Wagner, at Berlin, in *Fricka* and *Fides*.

THE THEATRES, &c.

HER MAJESTY'S.

The farewell nights re-commenced on Tuesday, and have been given every evening: in all probability these performances, at playhouse prices, will be continued until the 11th of October, the closing day of the Exhibition. Madame Barbieri Nini, Madame Fiorentini, Mdlle. Cruvelli, Mdlle. Fuller, Signori Calzolari, Pardini, Lorenzo, and Casanova, have been the principal singers in the various operas.

SURREY.

A clever English adaptation, by Mr. George Linley, of Donizetti's "Linda," was produced on Monday. Miss Romer sustained the part of *Linda*, and Miss Poole was the boy *Perotto*; Mr. Travers was the *Intendant le Servat*, Mr. Stanley *Antonio*, Mr. H. Corri the *Marquis*, Herr Kuehler the *Prefetto*, and Mr. Borrani *Antonio*, the father of *Linda*. This interesting lyric drama was originally composed in 1842, for Vienna, and is one of the latest works of the gifted composer, who died at Bergamo, in 1848, after having been a helpless lunatic, in an asylum near Paris, for some years. Whilst singing incoherently a few phrases from "Linda," the idea was suggested to his friends to remove him to his native place—only to die. Great pains were evidently taken by Donizetti with the orchestral accompaniments in "Linda," having to write for the Viennese amateurs; and the overture, albeit barren of a captivating subject to catch the ear, is artistically conceived and carried out. On the Italian boards, in this country, the opera has never been especially popular: this is no doubt owing to the manner in which the libretto has been, probably, from the defective construction of the poem. The first act begins well, but is spoiled by the silliness of the part of the *Marquis*, who is a great bore throughout the libretto. Then again, in the second act, the number of duos rapidly succeeding each other, without the intervention of a concerted piece, will always produce much heaviness. There is some charming imagery in the melodies dispersed through "Linda:" the palaces of the heroine, in the first act; the aira assigned to her faithful friend *Pierotto*, the duo between *Linda* and her lover, the ever ear-haunting "Da quel di," the duo between *Linda* and the Savoyard boy, in the second act: the trio and that scene, and the concluding scene of *Linda*, on her return to her native valley, are exquisite specimens of Donizetti's melodious inspiration.

The Surrey audience received the opera with the greatest enthusiasm, applauding vehemently the touching and vigorous acting of Miss Romer, whose voice is in excellent condition, the delightful vocalisation of Miss Poole, and the artistic exertions of Messrs. Travers and Borrani. Great care has been bestowed on the mounting of the work; and if the operatic execution be compared with that of a few years since, it will be quite evident that the amateurs south of the Thames begin to exhibit no small appreciation of art progress.

PRINCESS'S.

New dramas from the pens of Mr. Douglas Jerrold and Mr. Dion Boucicault, are said to be shortly forthcoming at this theatre. The length of time during which the revivals and original plays produced by the present management have run, testifies to their opportunities of noticing the performances here. This fact, however, testifies to the continued success of the establishment, and is highly creditable to the taste and judgment of its conductors. Whether the public may have improved themselves and their dramatic skill: taste-reformers; and why they can consent to let "The Gamester," and such plays go the way of "George Barnwell," little will be left for them to do in that direction, except to pursue the course they have so successfully commenced. One great merit the managers may claim. They have selected a company thoroughly, as we believe, respectable, and certainly, as we remarked at the opening of the theatre, thoroughly good-looking. Competent to the work undertaken they are, while the style of acting adopted by the principals and leaders is distinguished by an elegance, a refinement, and a finish not elsewhere excelled, if equalled, the subordinates have been judiciously selected from the talented and meritorious members of the profession, several of them tried and proved by the character they have sustained for years. To those ardent spirits who effected the liberation of the stage we are indebted for the possibility of the present, and that of Sadler's Wells theatre, which, being opened and conducted on high principles—one for revivals, and the other for original novelties. The local situation of the two houses, we think, points this out as the natural division of dramatic business between them—the northern one being provided with performers better suited to the weight of the old drama, and the western one with those whose artistic sympathies are evidently with the lighter style of the new. These have, in Mrs. Keen, a representative whose unequalled pathos peculiarly fits her to enact the heroines of the modern play, which in general are less stern in motive, purpose, and action than their predecessors on the Elizabethan stage; and in this circle of art she may move with supreme dominion, as an enchantress in a paradise of her own creation, and, in part, of her own creation.

ADELPHI.

On Monday, Madame Celeste took her benefit and farewell of her audience at this theatre, until her return from America. She performed in the "Queen's Horse," and "Green Mark," in "Flying Colours," and in the second act of the "Green Bushes," shewing in each the "comprehensiveness" of her genius. The house was crowded, and the actress vehemently and deservedly applauded. Though frequently summoned, she declined to come forward until the conclusion of her performance, when she delivered the following speech:—

"Ladies and Gentlemen—My good, kind, indulgent patrons, it is with feelings of gratitude beyond my powers of expression that I appear before you, to issue my grateful adieu. To this country—so generous in its sympathies for the stranger, wherever born—I owe my present proud position; for you gave a value, by your golden opinion, to that little talent which my warm-hearted mother discovered and encouraged. My direction of this theatre, through the liberality of the manager and the affectionate zeal of a talented company, has been a labour of love; and if you approve—as the crowded houses nightly evidence—I feel I am repaid beyond my deserts. On occasion ought I to omit—especially such a one as this, with their flattering eulogiums newly locked in memory—to thank the press collectively and individually; remembering that the actor's calling would cease to be an art. Nothing, ladies and gentlemen, would take me from you but a duty of gratitude I hold sacred to those in the New World, who first took me by the hand; and I should not be mistaken if I said some that dur'y I did not visit them again, and take a long and lasting leave. Ladies and gentlemen, my heart is too full to say more than with all my heart I thank you—with all my heart I bid you adieu —*it Deus vous bénisse*."

We are informed that the company presented Madame Celeste with a testimonial of their personal regards—an elegant bracelet, which was received with due acknowledgments.

We present our readers with a Portrait of Madame Celeste, in the character of the victim of the Iron Mask, quietly awaiting her fearful destiny, from which, however, she is saved by the self-sacrifice of the unknown father of her beloved.

During her absence in America, Madame Celeste has desired to provide us with amusement from the United States in the person of Mr. J. Silsbee, a delineator of Yankee eccentricities. He made his first appearance on Monday evening in a piece specially written for him, and the Yankee Plough-Boy." To describe this affair is next to impossible much, of course, in relation to the national peculiarities caricatured, must be taken on trust by an English audience; but there are some amusing fun themselves, and the style of the actor is so broad and unctuous, that the spectator is irresistibly affected, or rather literally convulsed with laughter. The theatre, from beginning to end of the piece, was in a roar. In itself, the drama is poor and weakly sentimental: but the one character is so forcible as it is new. Queer tales, violent Jonathanisms, are corroborated by the "Cape Cod Reel," in which Mr. Silsbee dances as none ever danced before him. When all was over, he delivered a brief address, or apology, promising to be "stronger and sticker" on another occasion, when he hoped to get rid of his present cold, and concluding with a benediction—all in a large Yankee style of delivery, which renewed the merriment of the audience. Truly, Mr. J. Silsbee promises to be a great attraction.

AMELIA BLOOMER, ORIGINATOR OF THE NEW DRESS FROM A DAGUERREOTYPE BY T. W. BROWN.—(SEE PRECEDING PAGE.)

PARIS FASHIONS FOR OCTOBER.

SEPTEMBER and the sporting season have brought back country life: it a few persons yet remained in town, they hastened to take their departure, carrying with them the last novelties of this unsettled season. Men's sporting dresses have nothing remarkable for hunting or shooting; taste is the chief guide. The ladies who meet the sportsmen at luncheon, generally ride to the *rendezvous*; and, as the season is generally chilly, habits of light cloth are indispensable. They should be in very simple taste: the skirt does not vary, being plain and long. The body should be without ornament, and close round the neck; they are made without collars, the edge being concealed by the turn-down collar of a plain *fichu*. A single row of buttons fastens the habit in front, which can be left open at pleasure, by turning in the lapels; in this case a jaconet chemisette may be worn, but it should be plain, simple, and without embroidery or lace. The sleeves fit closely to the arm, closed tight to the wrist, and are hid by plain wristbands, and well starched. Loose sleeves are also made with jaconet under-sleeves, buttoning at the wrist: a facing finishes the sleeves; but the plain sleeve is preferable, the hand being much freer, and unencumbered for using the bridle. A black ribbon tied round the neck is indispensable. A gentleman's hat without the feather is alone worn, with a green veil. The skirt of the body is short, and almost fitting close to the petticoat, without slits as in the skirts of dresses. The darkest shades are most worn; fancy-coloured stuffs are out of season.

For ladies who follow the hunt in carriages, and who merely appear at the meet, all the dresses for the country which we have spoken of in our late Numbers are fashionable—Valencias, nankeen quilting, &c. Short cloth cloaks are very serviceable for this weather, which is constantly liable to change, the sun being hot in the daytime, but the nights are cold. The shape of these dresses is the same as those of last spring, round, and falling straight, mousquetaire form, more or less plain, but generally trimmed with embroidery, braid, and lace, without fringe.

We have already spoken of the appearance of scarfs at the end of the summer season; others are preparing for autumn, which will partake of the summer mantelet scarf and the winter cloak. The shape behind is like a scarf, and ends with a point in front. They may be trimmed with a slight fringe, lace, embroidery, braid, and jet; if a very handsome scarf is desired, it can be trimmed with two rows of deep lace.

We should also mention a fashion which is about to be introduced, but which is only fit for the country; and even there it is anything but graceful, notwithstanding all the art that may be applied to its disposition. This is a hooded mantelet. It is so difficult to adapt the hood to the mantelet without encumbering the shoulders awkwardly, that we do not think this fashion will be long-lived, except for the country, where it certainly has the advantage of protecting effectually the neck and shoulders against the first chill of autumn. In town dress we are without any novelty at present.

MADAME CELESTE'S FAREWELL APPEARANCE IN THE "QUEEN'S SECRET."—(SEE PRECEDING PAGE.)

THE ILLUSTRATIONS.

Human's habits of bronze zephyr cloth, the body joined to plain skirts, and fitting tight. Cap, groundwork of embroidered bands and Valenciennes, trimmed with taffetas ribbons. Dark barège dress, three coloured striped flounces setting off the ground, open in front, with skirts to the body; pagoda sleeves, and under sleeves of white muslin, closed at the wrist with Malines lace. Yellow straw bonnet, trimmed with two bunches of cock's feathers. Redingote or paletot of grey taffetas, trimmed down the front with four rows of quilled ribbon; body open in front, with *basques* or small skirts, trimmed like the dress with two rows only; sleeves open, both the upper and under, trimmed also with quilled ribbons, and the slits joined by plain ribbons. Muslin *fichu* trimmed with Valenciennes lace.

PARIS FASHIONS FOR OCTOBER.

NOOKS AND CORNERS OF OLD ENGLAND.

RUINS OF DILSTON HALL, THE SEAT OF THE LAST EARL OF DERWENTWATER.

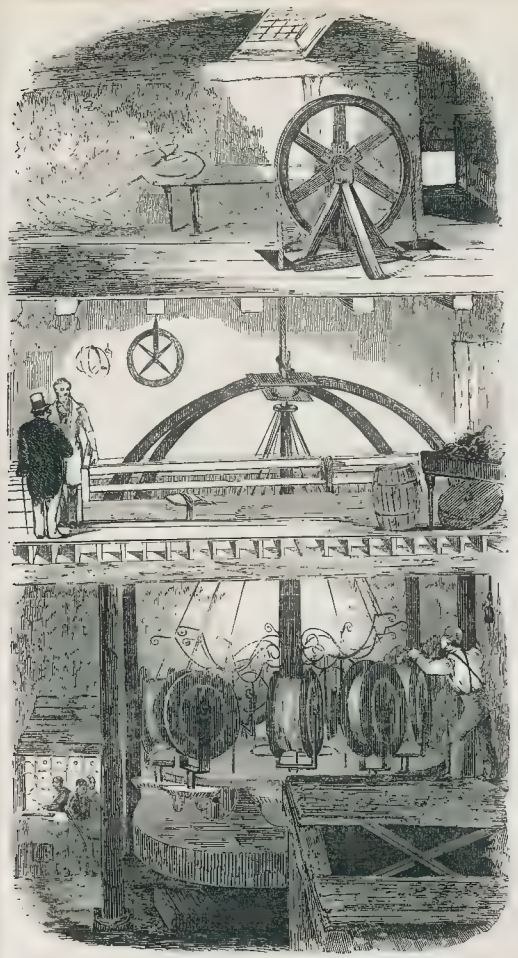
THE romantic scenery of the Devil-water, a stream near which Dilston, or Devilstone Hall is situated, and the desolate appearance of the ruined Hall itself, are entirely in unison with the brief and melancholy history of the devoted and unfortunate Earl of Derwentwater. Dilston, the baronial seat of the ancient

REMAINS OF DILSTON HALL, NORTHUMBERLAND.

family of Devilstone, is about two miles distant from Hexham, in Northumberland. It stands on an eminence at the entrance to a deep woody dell, near the confluence of the Devil-water and the river Tyne. The Hall was rebuilt in 1768, but has fallen to ruin, with the exception of the chapel belonging to it, which is kept in repair, and whose vault contains the remains of the Ratcliffe family. The baronial tower of the ancient Lords of *Devilstowne* still exists near the premature ruins of the comparatively modern edifice of the Ratcliffes About two miles higher up the stony course of the river is a spot called the Linnels, where the Lancastrian army encamped previously to the battle of Hexham; and not far from this place, opposite a farm called the Black Hill, is the "Queen's Cave," the traditional scene where the fugitive Queen Margaret and her infant son were protected by the robber after the disastrous battle of Hexham. It is a recess in the rock, 31 feet long and 14 feet broad, but so low as scarcely to allow an ordinary-sized person to stand upright within it.

The Barony of Devilstowne passed from the family of that name in succession, to the Tyndales; a family which produced William Tyndale, one of the first translators of the Scriptures into the English language, and who was burnt for heresy at Antwerp, in 1536. Another member of the family is recorded under the remarkable denomination of "Jock Fitz do jock," otherwise "John about the Pan." From this family the barony was transmitted to the Claxtons; one of whom married Sir Edward Ratcliff, a knight of the body to Henry VIII., and who became heir in remainder to the estates, failing issue of his brother Sir Richard.

The fortunes of the ill-fated Earl, who devoted himself to a forlorn cause, urged by a principle of romantic honour, and paid the penalty upon the scaffold, at Tower-hill, are sufficiently known, and have scarcely at this day ceased to be deplored in Northumberland, where his gracious and amiable qualities have endeared his memory: and strange tales have mixed themselves with the superstitions of the simple inhabitants of the Devil-water, and the neighbourhood of Corbridge, relating to the portents which accompanied the death of the unfor-



SECTION OF THE MANUFACTORY, SHOWING THE PROGRESS OF THE ROPE FROM THE GROUND-FLOOR TO THE WHEEL IN THE SECOND STOREY.

WINDING THE IRON WIRE ON THE BOBBIN.

tana's nobleman, and the downfall of an ancient family; and the aurora borealis, which made an extraordinarily vivid appearance in Northumberland on the night of the execution, is still called by the old people *Lord Derwentwater's corpse lights*.

The Earl was denied his last request, to be laid with his ancestors; embodied in a ballad well known in the north country as "Derwentwater's Farewell:"—

> Albeit that here in London town
> It is my fate to die,
> Oh, carry me to Northumberland,
> In my native grave to lie:
> There shall my body repose
> In Hexham's holy bowers,
> And there you may look for fair Tyndale
> Scatter my grave with flowers

And his remains were ostensibly interred in the churchyard of St. Giles-in-the-Fields, where there is a stone to his memory, bearing his arms, and an inscription, both nearly obliterated. It is on the north side of the churchyard, overlooking High-street, and not far from the tomb of the Pendrells, celebrated for their devotion to an earlier member of the Stuart family, in whose cause the Earl fell a sacrifice. But either this funeral was a mock ceremony, or the corpse was subsequently disinterred; for, on an examination of the family vault in 1805, made by desire of the Commissioners of Greenwich Hospital, the body was capable of being recognised not only by the mark of decapitation, but also, through a remarkable state of preservation, by the open countenance and regular features, which were still found to correspond with the portrait of the ill-starred nobleman. It is traditionally said that the Earl's body was conveyed privately, by night, to this place, and that by day it was deposited in the different houses on the running to persons of the Roman Catholic Church, where solemn obsequies were performed over it. The chapel at Dagenham Park, in Essex, is said to have been one of those resting-places; and at Ingatestone, in the same county, there was an old woman, the inmate of an almshouse, not many years ago, whose mother, as she stated, assisted in sewing on the Earl's head. At Thorndon, the seat of Lord Petre, is preserved an oaken chest, bearing an inscription in brass, engraved by Lady Derwentwater's order, which contains the dress worn by the Earl at his execution, the neck of the shirt being cut away, and the back serge which covered the block stiffened with blood, and cut through by the fatal blow which severed the head.

A man of feeble mind, who, within a few years, performed the office of pew-opener, and other duties, in St. Andrew's church, at Newcastle-upon-Tyne, familiarly known as Billy Ratcliffe, was believed to be the last representative of the ancient and honourable house of Derwentwater.

THE SUBMARINE ELECTRIC TELEGRAPH.

THE Company for the execution of this great scientific labour have resumed their operations—it is hoped, to be rewarded by complete and permanent success.

The progress of these operations will hereafter be detailed: our object in this place being to describe, in its several stages, the manufacture of the great submarine telegraph rope, the heavy coils of which England and France are ere this perhaps less but nearer communication.

This rope is the work chiefly of last autumn, and is made up of the present year, in which the rapidity of execution bears on its merits; for, though the telegraph-rope be not less than twenty-four miles in length, it has been completed in the short space of three weeks. No manual labour could effect such an undertaking scarcely in as many years; and any one who has had the opportunity of examining the machines employed, will find how much is due to the intelligence and exertions of George Fenwick, an engineer of the Seaham Harbour Iron-works, in Durham. The great machine represented in our Illustration was invented and constructed by him in ten days, but not to be worn out thus cased in twisted iron wires, it passes over the centre sheave (a wheel on the second story of the works), thence over a whelp-wheel, and is conveyed out at the door to the coil in the yard, as represented in the View.

The steam-engine by which this machine is worked makes 60 revolutions per minute, driving the machine at the rate of 18 revolutions per minute, and drawing off 11 inches of rope in one revolution.

The labour to produce this telegraph has been ceaseless—day and night incessantly has the mighty coil been gathering its miles of length, to be conveyed on board the *Blazer*, the Government steam-ship, to proceed with it across the Channel.

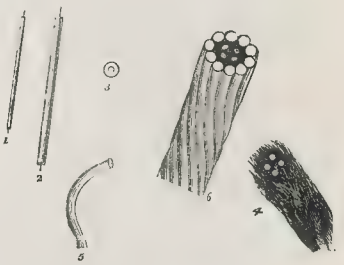


Fig. 1. First layer of gutta percha over the wire.
2. Second layer of gutta percha, enclosing Fig. 1.
3. Section of Fig. 2
4. Wires bound in yarn steeped in solution.
5. Galvanised iron wire.
6. Complete rope bound with galvanised iron wire.

We are happy to learn that Government holds out every aid and encouragement to the enterprising men who have undertaken to complete permanently what but a very few years since was deemed insanity or, at all events, not quite within the bounds of the possible.

The rope has been made by Messrs. Newall and Co., at the works of Mr. E. Weatherley, 30, High-street, Wapping.

To recapitulate, the rope is 24 miles long, and consists of four copper wires, through which the electric currents will pass, insulated by coverings of gutta percha: these are formed into a strand, and served or bound round with spun yarn, forming a core or centre, round which are laid ten iron galvanised wires of 5-16ths of an inch diameter, each welded into one length of 24½ miles, and weighing about 15 tons.

The rope weighs altogether about 180 tons; it forms a coil of 30 feet diameter outside, 15 feet inside, and five feet high, and has been made in the short space of 20 days.

THE SUBMARINE TELEGRAPH ROPE COMPLETE.

SHIPPING THE GREAT CABLE TELEGRAPH.

On Monday morning, at six o'clock, the interesting process of shipping, for deportation to its destination at Dover, the twenty-four miles of electric telegraph cable, was commenced on the river-side premises of Messrs. Blyth and Co., at Wapping. The *Blazer*, an old war-steamer, of from 600 to 700 tons burden, commanded by Captain Bullock, was placed by the Admiralty at the disposal of the promoters, having been completely dismantled for the purpose. Her funnel, masts, and upper rigging were removed, her boilers taken out, and, lying "high and dry" above tide, she presented nothing but a "sheer hulk." The transfer of the great mass of cable out of the yard on to the vessel, though a very laborious business, was accomplished very cleverly. This was done by passing it over an elevated revolving wheel, above the coil, and thence to another wheel, some 7 feet in diameter, on to a stage some 50 feet high, overlooking the High-street, and thence through a wooden trough, across the street, on to the wharf on the opposite side, so as not to interfere with the traffic of the thoroughfares. Here it was again hauled with seaman-like celerity from off the wharf on to the prow of the vessel, over what are termed "chocks" and supporting poles, at the rate of about a mile an hour, and then stowed away in a continuous coil down the hatchways into the hold. This process was rendered the more laborious in consequence of the clammy covering of tar, which, owing to the nature of the process employed in the manufacture, still adhered to the cable, and it was not completed until Wednesday morning about ten o'clock, when, after working throughout the night, the entire coil of telegraphic tackle was safely deposited by the workmen on board the *Blazer*, which was immediately taken in tow by two steam-tugs, and thus proceeded to Dover.

THE ADULTERATIONS OF TEA.

Amongst the recent investigations of the *Lancet* relative to the adulteration of articles of consumption, the inquiry respecting tea is one of the greatest interest and importance, on account of the universal use of that delightful beverage. As far as our own dealers are concerned, the results obtained are not unsatisfactory, but the extent of deception practised in China is beyond what most persons will be prepared to learn. The Chinese themselves not only use a vast number of injurious materials, but also other leaves than those of the tea plant—a system which has increased since the trade was thrown open and the inspection of the East India Company ceased. In England some of the spurious manufactures consist of the leaves of the beech, elm, horse-chesnut, plane, fancy oak, willow, poplar, hawthorn, and sloe, the latter being most frequent on account of their astringent quality. The use of re-dried tea-leaves, however, has been the most general form of imposition here; and in 1843, when the process was interrupted by the vigilance of the Excise, it is supposed there were not less than eight manufactories for the purpose in London alone, besides many in the provinces. The leaves were bought up at coffee-houses, at 2½d. per lb., mixed with a solution of gum, re-dried, and then coloured with rose-pink and black-lead to "face" them, a bloom being also sometimes imparted with a vegetable red mixed with carbonate of lime. The practice still prevails to some extent, catechin being added for its tannin, but it is greatly limited by the present, catechin being added for its tannin, but it is greatly limited by the present, catechin being added for its tannin, but it is greatly limited by the present

the construction of the social edifice, we shall see that the labouring classes the foundation of the fabric; and unless that foundation is solid, and firm, and stable, the fabric cannot be expected to last. (Cheers.) Nobody an hope to make the poor rich—that would be contrary to the dispensations of Providence in the creation of the human race. * * * * have can change the unequal distribution of wealth. You may by bad laws impoverish the rich, but I defy you by any process whatever to enrich the poor! Cheers.) But if we cannot enrich them, we can do a great deal to make their very comfortable, by enabling them to command as great a portion of the occasories of life as the dispensations of Providence, and the laws of nature will enable them to have within their reach. (Cheers.) That is exactly what has been done by the repeal of the corn-laws." (Cheers.)

With respect to slavery and the slave-trade the noble Lord observed:—

"It is indisputable that the crimes committed in connection with African slavery and the African slave-trade, if they could be put together, are greater in amount than all the greater crimes committed by the human race from the beginning of the world until now. (Cheers.) I repeat, that if we could put together all the crimes ever committed by the most guilty of men, they would not exhibit a greater amount of human suffering and misery than has been created by that detestable and infernal traffic. (Loud cheers.) It required a great sense of what was right on the part of our forefathers, when we started themselves with the strength and unequivocal degree of exertion on their part, as I on that of such men as Wilberforce and Carkson—(Hear)—to wean the nation from a course to which they had been so long accustomed. They succeeded. (Loud cheers.) They began by washing their hands of that guilt which had so long stained them, and the nat on did so at the cost of a vast pecuniary sacrifice, made with greater willingness and cheerfulness in that case than in many other instances. (Cheers.) Our example here has been of great value to others. For instance, would not have done (Cheers.) Here is an additional bond of union between two great nations! (Cheers.) Sometimes nations are united in a league of mutual injustice; but here we are in a league of unity of humanity and noble benevolence. (Cheers.) We have laboured long in this course—the present Government most anxiously and sincerely—but we would not on any account take any credit that does not fairly belong to us. It is to the people of England that the merit chiefly belongs." (Cheers.)

SIR JAMES GRAHAM ON AGRICULTURAL PROTECTION.

At the dinner of the annual East Cumberland Agricultural Show, on Thursday week, in Carlisle, Sir James Graham presided.

The Right Hon. Bart., in giving the toast of the evening, "Success to the East Cumberland Agricultural Society," said "I have heard with some regret that it was fancied in some quarters that all the good societies of this nature could it was fancied in some quarters that all the good societies of this nature could it was fancied in some quarters that all the good societies of this nature could

NEW BOOKS &c.

NATIONAL ILLUSTRATED LIBRARY.
BOSWELL'S LIFE of JOHNSON. Vol. III now ready, Vol III of this popular Series, Illustrated with Portraits of Johnson's most celebrated contemporaries, and with topographical and other sketches of the principal scenes.
Vol. IV will be ready with the Magazines, on the 30th instant.
The following Volumes of the series have already been published, price 2s 6d each, handsomely bound, and originally Illustrated with Wood Engravings, by the most eminent artists:—
The MORMONS: a Contemporary History
The BOOK of ENGLISH SONGS.
The ORBS of HEAVEN: or, The Planetary and Stellar Worlds. By D. O. MITCHELL, M.A
Several other Volumes, original and selected, are in preparation, including Rae's Travels in China, Tartary, and Thibet; Mackay's Memoirs of Extraordinary Popular Delusions.
London: Office of the NATIONAL ILLUSTRATED LIBRARY, 198 and 377, Strand; and to be had of all Booksellers

Price 10s 6d.
GEMS of WOOD ENGRAVING, from the ILLUSTRATED LONDON NEWS; with a History of the Art, Ancient and Modern. By WILLIAM A. CHATTO
London: W. LITTLE, 198 and 377, Strand

DR CUMMING'S NEW VOLUME OF LECTURES
This day is published, in fcap 8vo, price 8s. cloth, full gilt, uniform with "Apocalyptic Sketches,"
FORESHADOWS; or, LECTURES on our LORD'S MIRACLES, as Exhibitions of the Attributes of the Son of God. By JOHN CUMMING, D.D., Minister of the National Scottish Church, Crown-court, Covent-garden
ARTHUR HALL, VIRTUE, AND CO., 25, Paternoster-row.

BOHN'S STANDARD LIBRARY FOR OCTOBER.
NEANDER'S HISTORY of the PLANTING of the CHRISTIAN CHURCH. Vol. 2, containing the Author's recent additions. Also, ANTHOSOPHIE, or, Spirit of Psychology, translated from the German by J. E. RYLAND. Post 8vo, 3s 6d.
HENRY G. BOHN, York-street, Covent-garden

BOHN'S CLASSICAL LIBRARY FOR OCTOBER.
OVID'S METAMORPHOSES, literally translated into English Prose, with Notes, and Explanation of each Fable. Post 8vo. Frontispiece 5s.
HENRY G. BOHN, York-street Covent-garden

BOHN'S ILLUSTRATED LIBRARY FOR OCTOBER.
DIDRON'S CHRISTIAN ICONOGRAPHY; a History of Christian Art, translated from the French, with upwards of 150 beautiful outline Engravings in two volumes. Post 8vo. Vol. I. 5s
HENRY G. BOHN, York-street, Covent-garden

BOHN'S SCIENTIFIC LIBRARY FOR OCTOBER
STOCKHARDT'S PRINCIPLES of CHEMISTRY exemplified in a series of simple Experiments, with upwards of 200 Diagrams and Engravings, translated from the German. Post 8vo 5s
HENRY G. BOHN, York street, Covent-garden

THE GREAT EXHIBITION PRIZE ROYAL
Cod-liver is now the all important question, which is here most satisfactorily answered."
London: HEATH, LEDGMAN, CHEEK, BROWN, and LONGMANS

Now ready, in 2 vols, with Illustrations, 25s,
EIGHT YEARS in SYRIA, PALESTINE, and ASIA MINOR, from 1842 to 1850. By P. A NEALE, Esq., late attached to the Consul-at-Smyrna in Syria.
"One of the best accounts of Syria and its people that has been published of late years."—Spectator.
COLBURN and Co, Publishers, 13, Great Marlborough-street.

NOTICE.
VOL. III. of LIVES of the QUEENS of ENGLAND,
By AGNES STRICKLAND.
Now, Revised, and Cheaper Edition, embellished with Portraits of every Queen, is now ready at all the booksellers. To be completed in 8 vols. Post 8vo, 10s each.

TOLKIEN'S 25-GUINEA ROYAL MINUTO PIANOFORTES, nearly 7 octaves, G # fall, metallic plate, with all late improvements, in mahogany, coss, maple, walnut, or rosewood. The great peculiarity and worth of these pianofortes is that they will stand any climate without injuring the delicacy of their original beautiful tone and touch.—TOLKIEN, manufacturer, 23, 24, and 39, King William-street, London-bridge Drawings post free.

PIANOFORTES at Manufacturing Prices.—Messrs. HOLDERNESSE and CO., 444, New Oxford-street, London, beg to inform the public that they have established a Depôt, and purchased the price of their Piccolo Pianofortes, in rosewood, 8ves, or walnut-wood and polished mahogany, 10 guineas each. They describe instruments are 6f octaves (C to A) in compass, combines all the latest improvements, are possessed of amazing power, and elegance of appearance of tone, and finished with the same care and attention that has hitherto distinguished their manufactures. Warranted for three years, and exchanged if not approved on receipt of second-hand by Broadwood, Collard, Erard, and other makers, from £10. and double value will be allowed on the hire. Price List Free, by Description of musical instrument lamed, repaired, and taken in exchanges.

THE GREAT EXHIBITION.—A valuable newly-invented very small powerful Watch-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four to five miles, which is found to be invaluable to the Yachtsman, and to Sportsmen, Gentlemen, and Gamekeepers. TELESCOPES, possessing such extraordinary powers, that objects at Sea, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the Double Stars. They supersede every other, and are of all sizes for the Waistcoat-pocket, Shooting, Military purposes, Reviews, Opera and Race-course Glasses with wonderful powers; a minute object can be clearly seen, from Ten to Twelve miles distant.—Invaluable newly-invented preserving Spectacles, invisible and all kind of Scientific Instruments of the most approved description.—Mrs. R. and M. SOLOMONS, Opticians 29, Albemarle-street, Piccadilly

NEW SHOW-ROOMS for BEDSTEADS,—HEAL and SON have erected show-rooms adjoining their manufactory for the purpose of keeping every description of bedstead. In iron their stock will include every size and pattern, from the cheapest to the most elaborate; to the handsomely ornamented tubular pillared canopy, as well as brass bedsteads of every shape and pattern, and in wooden bedsteads their rooms will be sufficiently extensive to allow them to display a variety, both in polished birch and mahogany, of four-post, canopy, and French and also of japanned bedsteads In fact, to keep in stock every sort or bedstead that is made and they have also a general assortment of bedding, blankets, counterpanes, and dimities, so as to render their stock complete for the furnishing of bedsteads as well as bedding, and without any delay to comply with the prices at which the lowest class of furniture is sold, and which is fit for no useful purpose, their new stock will be found to be priced on the same principle by which their bedding trade has during the last thirty years been so successfully attained and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials sound workmanship, and warranted. Heal and Son's list of bedding, containing full particulars of weights, sizes, and prices of every description of bedding, sent free by post on application to their factory, 196 (opposite the Church), Tottenham-court-road.

THE ILLUSTRATED LONDON NEWS.

No. 520.—VOL. XIX.] SATURDAY, OCTOBER 4, 1851. { TWO NUMBERS, 1s. WITH HALF-SHEET SUPPLEMENT, GRATIS.

THE DWELLINGS OF THE PEOPLE.

At the present time, the greatest Continental nations are engaged in discussions upon the fundamental principles of society. These discussions, which are now and then carried on peacefully in clubs and newspapers, and quite as often very stormily conducted by means of barricades and street fights, are at the best but unsatisfactory. French and Germans are by no means agreed upon the meaning of the liberty which they love, of the equality which they insist upon, or of the fraternity of which they dream, and in pursuit of their trilogy continually enact scenes which sorely belie the sacred words which are fabled to have inspired them. But we in England, thanks to the sturdy common-sense of our forefathers, have luckily mastered these rudiments, and having acquired a greater amount of practical liberty than is enjoyed by any other nation in the world, have reached a higher stage in our social development. For the last ten or a dozen years, the leaders of opinion have more especially directed their attention to questions which affect the health, the comfort, the rational amusement, and the physical and moral well-being of the masses. It is only in England that sanitary science can be considered a popular topic. There is not leisure for such a study among populations whose chief business is to play at soldiers; but in our country—with much social evil to be diminished, if not remedied and prevented—it is fortunate that the wealthy, the powerful, and the intelligent have not been so intensely satisfied with the existing state of things, as to shut their eyes against the mischiefs which are quite compatible with a very high civilisation, and with the enjoyment of the greatest possible amount of political liberty. It is true that our sanitary reformers have still a vast amount of labour before them; that London yet possesses a barbarous cattle market, and does not possess a good and cheap supply of water; that many of our large and growing towns are even in a worse condition than the metropolis—undrained, unsewered, ill-watered, ill-lighted, and ill-ventilated; and that many hundreds of thousands of the people live in physical as well as in moral degradation. But, after all, much has been already done. The social elevation of the multitude has become the question of our country and our time; and from the Prince Consort, who may not interfere in Parliamentary politics, but who may lend his illustrious name and his great talents to the more valuable, if less exciting, efforts of the philanthropic arena, downwards through all classes of the active-minded men who influence opinion, these questions attract more attention than any other. Most of our populous and thriving towns are endeavouring to provide public parks, libraries, and museums; to build model lodging and dwelling-houses for the labouring classes; to establish public baths and wash-houses; and, in many instances, to encourage, by means of garden allotments, a taste for floriculture and horticulture among the poor. All these things, done or attempted, are symptoms of the great fermentation of those ideas of social development which have sprung from the uninterrupted peace of the last six-and-thirty years, and betoken a new—and, it is to be hoped, a favourable—era in our national history. The very troubles and perplexities of our neighbours have given these questions an impetus; for not only religion, and philanthropy, and the natural progress of civilisation in a country happily not at war, but the reasonable calculation of the upper classes, that the best means of maintaining a population in quiet is to extend the comforts and the decencies of life to the very lowest substrata, have co-operated to this result. A regard for, and fear of, the people, have combined to excite attention to their condition. But, whatever may be the causes, the result is certain; and, as far as it has yet extended, it is beneficial and gratifying. The country that can minimise political, and maximise moral and social questions, is in a fair way of becoming greater and happier, and of extending a humanising influence to every quarter of the earth.

One great secret of the growing favour of such projects for the amelioration of the condition of the working classes, as we have mentioned, probably lies in the fact that these projects are discovered to be self-supporting, and not eleemosynary. Charity is a blessed thing; but if the men who endeavour to provide the poor with better homes, and with more extended facilities for comfort, health, and recreation, make their efforts successful in a pecuniary sense, they do a far greater amount of good than any mere act of charity could accomplish. They relieve themselves from the invidious position of administering ostentatious benevolence, and at the same time place the poor upon that footing of equality which is most consistent with mutual self-respect and permanent good-feeling. When public baths and wash-houses are found to pay their cost, and to answer as mercantile speculations; when garden allotments are found to be attainable without loss to those who originate and conduct them, and with pecuniary profit to those who cultivate them; and when it is discovered by capitalists that decent dwellings for the people, built with a proper regard both to amenity and utility, and with all the appliances of modern science and discovery, can be constructed so as to pay a very fair percentage on the sums invested in them, a practical victory has been gained of a higher amount of benefit than could accrue from any acts of pure philanthropy, however extensive. This is our present position; and the abolition of the Window-tax, which formerly prevented the outlay of money upon blocks of buildings for the working classes, may be expected in due time to lead to a large increase in the number of such edifices in all our great towns. But, while rejoicing at this prospect, we would ask whether

ATTACK ON A CHINESE PIRATICAL FLEET BY THE BOATS OF H. M. S. "CLEOPATRA," IN BIAS BAY.—(SEE NEXT PAGE.)

nothing is to be done for the rural districts? The agricultural labourers of England lie under peculiar disadvantages in this respect. Too often, by the operation of the law of settlement, the owners of the soil, to rid themselves of the support of paupers, demolish cottages and huts, and force the labourers to reside beyond the boundaries of their domains or their parish—in some instances as great as from four to six miles from the scene of their daily toil. No new homes are provided for these people, who often cluster too thickly for health or decency in buildings already overcrowded, or betake themselves to the nearest town, to be a burden upon the shopkeepers, and to congregate in miserable and turbulent places, where the cholera or the typhus is their constant companion. The cause of sanitary reform makes progress in all the great centres of our wealth and industry. It is high time that those who are interested—as who amongst us is not?—in the existence of a moral and happy peasantry, should bethink themselves of the means of providing them with dwellings fit for human beings, and of counteracting the evil consequences of that wholesale demolition which prevails in the rural parts of the country. If the whole labouring population of England must be driven into the towns—if England, like Spain, must see her rural districts depopulated, sanitary science must yet make greater efforts to improve our cities than it has yet done; but if, as the tendency of opinion would seem to indicate, and as true policy would recommend, the wants of the agricultural classes are to be studied, the sooner some attempt is made to stay the progress of demolition, and to improve the existing dwellings of the peasantry, the more creditable to our national character, and the more safe to our institutions.

ATTACK ON CHINESE PIRATES BY THE BOATS OF HER MAJESTY'S SHIP "CLEOPATRA."

We have been favoured, by an obliging correspondent at Hong-Kong, with the following interesting details of the scene engraved upon the preceding page, which is believed to be the first attack of the kind that has taken place by boat within 60 or 60 miles away from the ship:

"On the morning of the 24th June, Mr. Caldwell (superintendent of police), having received information from some fishermen, who had been robbed, plundered, and badly wounded near Mir's Bay, that some pirates were in the vicinity, waited on the senior naval officer to inform him of the circumstances of the case. Captain Massie thereupon ordered the *Cleopatra*'s barge, pinnace, and cutter to be manned and armed for a pursuit. These boats started from the ship at 11 30 A.M., under the orders of Lieutenant Price, in the barge, accompanied by Mr. Caldwell and Mr. Copland (midshipmen) In the pinnace, Mr. Archer; and in the cutter, Mr. Crofton; and a fisherman in each of the boats. In the cutter was Mr. Smith, Second-Master, and Assistant-Surgeon M'Kay. On meeting some boats outside the Lyemoon Passage, they learnt that, on the previous day, a junk had been captured near Mir's Bay. Although the men had only their dinners with them, they determined to push on, but were compelled to anchor for the night under the island of Simoon. On the following morning they learnt from the inhabitants of a small village, that the piratical fleet had been seen the day before in Bias's Bay; whither, after filling their water-bakers, they immediately proceeded. On nearing the point of the bay, three junks were observed at anchor, which, on sighting the boats, immediately weighed and made all sail up the bay, when chase was at once given, and, after several hours' exciting work, the boats succeeded in coming within shot of the bay, where they found they had them on shore. The crews jumped overboard and escaped over the hills, except two, who were made prisoners. Four other junks made their appearance from different parts of the bay, but succeeded in escaping during the time the others were being attacked. The vessels were all searched and burnt. The first junk mounted 17 guns, and carried above 80 men; the second mounted 13 guns and 60 pirates, and above 70 men. The third junk ran up at the very end of the bay, and had time enough to land her guns and the most valuable part of her stores, but, from the carriages left on board, she must have mounted 10 guns. The first two were armed with everything, particularly powder, ball, and stinkpots. The junks defended themselves during the greater part of the chase; two, in particular, that frequently rounded to, and opened their broadsides on the pinnace and cutter with shot and grape (a sean in the sketch); but fortunately without doing them any harm. The pirates which infest the entrance to the harbour, doubtless, have heretofore thought themselves pretty safe in committing depredations, unless when a cruiser was in sight, but will have taught them that a distance of fifty or sixty miles from a pendant in their own stronghold gives them no security, even when a steamer is not available. It happened to be the very same place where the *Fury* attacked 29 junks anchored in line, the whole of which were destroyed."

In the *Friend of India* we find the following additional particulars.

"The chase and running fight described by Mr. Caldwell, the captain of that period, and almost in the very spot where Shup-'ng-tchi's fleet was destroyed, three of the largest junks came to an anchor, and the crews, jumping overboard, fled for the hills. The largest of these, a junk of 1,200 tons burthen, now safely lodged in Victoria Gael, both of whom, besides gallipots of opium, had four or five dollars apiece on their persons.

"In thinking of the capture, we cannot find terms expressive of our sense of the praise due to Lieutenants Price and Forcher, three midshipmen, Mr. D. R. Caldwell, and the several boats' crews. Starting with only one day's provisions and water, they pulled and sailed with a determination and spirit for a good part of twenty-four hours before they came up with the enemy; and then, almost sick from exhaustion, they commenced (with two twelve-pounders) a cannonade and fusilade upon three vessels mounting eighteen guns apiece, and otherwise armed to the teeth, sufficient to have blown them out of the water with a single broadside—they continued that attack until nearly all the powder was expended, and eventually succeeded in capturing and burning them to the water's edge. Throughout this encounter there was only one casualty; Lieutenant Price being slightly wounded with a spent shot. The sails of the boats have suffered the most, and bear sufficiently honourable testimony to the severity of the encounter."

NAVAL AND MILITARY INTELLIGENCE.

THE BREVET.—There is now no longer any doubt on the subject of a brevet. It will probably be of the same date as the one in 1846; viz. the 9th November, the anniversary of the birth of the Prince of Wales. Although it is known that the brevet is decided upon, the extent to which it will proceed is uncertain.

NUMERICAL RETURN OF THE OFFICERS, ON RETIRED FULL AND HALF-PAY.—Lieutenant-colonels, 195; majors, 285; captains, 887; lieutenants, 1090; ensigns, coruets, and second lieutenants, 158; paymasters, 93; adjutants, 24; quartermasters, 185; surgeons and staff ranks above assistant-surgeons, 52; assistant-surgeons and apothecaries, &c., 78; veterinary surgeons, 10; chaplains, 20. The half-pay of lieutenant-colonels is usually 11s. per diem; that of majors varies from 7s. 6d. to 10s.; of captains, from 5s. to 8s.; of lieutenants, from 2s. 6d. to 3s. 2d., and no officer of this rank receives more than £50 15s. per annum; the ensigns' half-pay fluctuates from 1s. 10d. to 3s. 6d. per diem, the majority receiving 3s. a day; paymasters on half-pay draw from 4s. to 10s. a day; adjutants average 3s. 6d. per diem; quartermasters receive from 2s. to 3s.; regimental surgeons draw from 2s. to 17s 6d. a day, according to length of service; assistant-surgeons from 2s. 6d. to 8s.; veterinary surgeons, from 3s. 6d. to 12s.; chaplains, 2s 6d to 10s. The oldest lieutenant-colonel is Philip Walsh, Jan. 8, 1800; the oldest major is A. Rose, Dec. 10, 1807; the oldest captain is T. Askew, half-pay, Feb. 26, 1794; the oldest lieutenant is Charles Grant, half-pay, 8th, Jan. 8, 1778; the oldest ensign is Second Lieutenant Lyle, R.M., July 22, 1780; the oldest paymaster is G. Decarteret, 50th Regiment, Feb. 15, 1756; the oldest surgeon is J. Belton, half-pay, 7th West India Regiment, Sept. 14, 1791; the oldest quartermaster is J. Mingay, 93d Foot, May 12, 1783.

COMMISSARIAT DEPARTMENT.—From the evidence adduced, the select committee on army expenditure have recommended that a rigid revision in the commissariat department abroad shall take place, and a considerable reduction made in all our colonies. They are of opinion that the monetary transactions are unnecessarily complex, especially those applying to Canada; and in almost all the colonies the number of separate chests is much too great.

TROOPS FOR THE CAPE.—The Government have no present intention of sending any more troops as a reinforcement to the Cape of Good Hope.

THE NEW STEAM-VESSELS.—The new steam-vessels, one a 28-gun screw ship, after the lines of the *Tribune*, building at Sheerness; and a paddle-wheel sloop, after the lines of the *Cruiser*, building at Deptford, announced by us some time since to be built at Pembroke, are to be called respectively the *Cyprus* and *Harrier*, both old Royal Navy names.

THE TROOPS IN AUSTRALIA.—The only regiment now serving in Australia is the 11th Infantry; but, according to letters recently received from New Zealand, it appears that the authorities in Australia have applied to the effect that either the 58th or 65th (both serving in New Zealand) may be removed to Australia as a reinforcement. It is apprehended that the men of the 11th Regiment will, if possible, desert, in order to repair to the gold mine districts.

PRESENTATION OF COLOURS.—A set of new colours was presented to the 7th Regiment (Royal Fusiliers), in Portsmouth garrison, on Monday afternoon, by Lady Augusta Fitzclarence, wife of the Lieutenant-Governor, Major-General Lord Frederick Fitzclarence, G.C.B. The Governor's-green, at the end of the High-street, was the spot where the interesting ceremony took place, and it was crowded with spectators. The colours were the gift of the Lady Augusta, as were also the old colours belonging to this regiment, which were presented to it in 1829, Lord Frederick being at that time in command of the regiment. The set of colours consists of the Queen's colour, or Royal standard, and the regimental colour, the latter bearing the following names of actions and services in which the 7th has distinguished itself:—Martinique, Talavera, Albuera, Badajos Salamanca, Victoria, Pyrenees, Orthès, Toulouse, Peninsula

CAPTAIN GROSTAKES' INVENTION.—An invention by Captain Grostakes, of the Belgian Engineers, has been lately tested at Woolwich. It is a simple means of ascertaining the distance of any object against which operations may have to be directed, and is composed of a staff about an inch square and three feet in length, on the top of which is fixed a cross-piece, called a slide, to which is attached a plate of tin, six inches long and three inches wide, painted over with a white stripe across its centre. A similar plate is held by an assistant, and is connected with the instrument by a fine wire. When an observation is to be taken, the observer looks at the distant object through a glass fixed on the left of the scale, and adjusts the striped plate by means of the slide; the assistant also looks through his glass, standing a few feet in advance of his principal, at the end of the wire; *Ridge* soon has been ascertained, and the distance declared, the distance is read off on the scale. In the three trials made at Woolwich, the distance in one case, although more than a thousand yards, was determined within two inches; and in the other attempts, within a foot. It is obvious that such an instrument, if to be depended on, will admit of being applied to other than military surveys and operations, and may be made useful in the civil service.

FOREIGN AND COLONIAL NEWS.

FRANCE.

The persecution of obnoxious journalists by the Government is still maintained. The *Patrie* is to be prosecuted for having printed certain revolutionary documents, in violation of the law of July, which prohibits the printing of papers connected with criminal cases while under investigation. M. Baroche, the reponsible editor of the *Assemblée Nationale*, has been condemned on the 14th of October before the Court of Assize to take his trial on a charge of publishing a letter from a subscriber containing false assertions against the Government. The *Democrat du Rhin* has been seized. There has been one acquittal, however, that of M. Rouy, the editor of the *Presse*, who was tried on Monday, for having published the letter of M. Victor Hugo to M. Vacquerie, which had appeared in the *Audience*, and which we noticed last week. The jury returned a verdict of not guilty, and M. Rouy was discharged.

On general politics the advices of the week are more than usually barren of interest. The *Journal des Débats* declares that the party of order will stand by the electoral law of the 31st of May, and will not consent to its repeal for the sake of aiding the re-election of Louis Napoleon.

Amongst the rumours of the week was one respecting a change of the Ministry. M. Fanchier and the Minister of Justice, it was said, were to go out. M. Odilon Barrot was to be the new former, who was to propose a modification of the electoral law of the 31st May. Those rumours were, however, devoid of any foundation.

The annoyances caused to English residents in Paris by the late decree respecting foreigners have attracted the attention of the Marquis of Normanby, who has represented the matter to the French Government.

Two Legitimist pamphlets have been erected to seats in the Legislative Assembly, viz. M. Gouyon for the department of the Morbihan, and Capt. Kersaule, of the navy, for the department of the Finisterre. They are both of extreme Legitimist opinions, and have lived in retirement since the accession of Louis Philippe to the throne in 1830. M. Gouyon was an officer of the Royal Guard of Charles X., and distinguished himself in fighting in the streets of Paris against the insurgents during the "three glorious days of July." After the departure of Charles X. he retired from the army in disgust, and his friends say that he has not visited the capital for the last 21 years.

The marked attentions which

figure, intended to represent the "Genius of Art" (not the Genius of Wit, some of your London daily papers printed it), who is represented as showering laurels and crowns on all beneath. This figure, which indicates a high talent, is the work of M. Naves

The *salle* was pretty well filled with guests when the King arrived, accompanied by the Duc de Brabant, the Comte de Flandres, the Princess Charlotte, and a brilliant suite of Court functionaries, ministers of state, diplomatic grandees and their ladies, and notabilities of many kinds. His Majesty was received in due state by the President of the "Cercle Artistique et Litteraire," the givers of the *fête*, and M. Quetelet (who seemed quite as much at home here as among his figures, his statistics, and his political economy) delivered an appropriate address, which the King very gracefully received. As the Count Arrivabene, the President of the late Queen, or the Duke of Saxe-Coburg (I forget which), his Majesty did not stay long; but he found time to signalise all the diversities with not the slightest omission of his subjects, but those most distinguished for their genius or their talents in art or in literature.

If the *salle* was magnificent when still empty, it assumed a dazzling splendour when filled with thousands of persons—the ladies in full *toilette*, and many of the gentlemen in uniform. Dancing does not afford much material for description; indeed, to tell you the truth, the whole of my time was occupied in more agreeable observations. With so many lovely "living figures" around, as the Count's apprpriate address, which the King very gracefully received. As the Count figure" flitting before my eyes, it was no such great loss that the portraits and paintings were half hidden from the view. Enough to say, that the indefatigables kept up the ball of excitement till four o'clock in the morning, when, in the event, Belgium quite extraordinary as a revolution. As most of the hotels and *cafés* were kept open all night, you may imagine how gay Brussels was "for that night only." It reminded me of the Boulevard des Italiens at Paris, on the night of a *bal masqué* at the Opera.

The third day of the *fêtes* was not signalised by any great public display; but the young Princess went to the temple of the Augustins to preside at a concert, for there has been open a Flemish theatre, held in the "Cirque" (I believe the excellent Italian company played last year)—a performance by Flemings, and entirely in Flemish. The theatre was nightly crowded to suffocation.

The wind up of these *fêtes* was on Friday night, when the Grand Place was magnificently illuminated. Splendid by day, the effect at night, with the architecture of the Hôtel de Ville marked out by lines of lamps and gas jets, and the colossal statues of the Counts of Flanders, Egmont, Horn, and Van Artaveld, in greater part of the fine old houses glittering with light, was really grand. It is the conjunction of architectural form with brilliancy of lighting, that renders these illuminations on the Continent so far superior to anything we can produce at home, although in point of outlay and enormous masses of light we far transcend them. This week's excitement concluded by a grand display of fireworks on the Place d'Anvers.

You will have noticed how often the king's name has been mentioned. The King here, the King there, the King everywhere. A politic Prince is this same Leopo'd, Roi des Belges. He perfectly understands his position. When he first came to the throne he was regarded with doubt and mistrust; but, by a very judicious line of conduct, he has conquered the affections of his subjects—although living under constitutional monarchy, the Belgians enjoy the blessings of the most liberal of modern constitutions, the Belgians enjoy the blessings of the most "paternal" system of government a combination which renders the country peculiarly interesting. To him is owing every public display. You have recent visit the Province commenced with the King, and the fireworks ended with the King. His Majesty also introduces his sons to the people, making them the deputies on all possible occasions. They thus become accustomed to a Sovereign, without seeming to be subjects.

F.

EXPECTED VISIT OF KOSSUTH TO ENGLAND.

The following communication, dictated by Kossuth, and addressed to the Mayor of Southampton, was received by that functionary on Tuesday afternoon

Marseilles, Sept. 27, 1851.

Sir,—His Excellency, Governor Kossuth (my chief), with thankful sentiments acknowledging the lively interest and the high-minded sympathy which the generous city of Southampton, and you, sir, particularly, were on so many occasions honouring the Hungarian name, for the fate of its exiled leader, and of all Hungarians; also who obtained to land on your hospitable shore, has entrusted me with the agreeable duty of a pressing, sir, his hearty congratulations to inform you that, encouraged, with the generous consent of his Majesty, the Sultan, without any previous negotiation whatever, but rather with unasked liberality, the Sultan, without any previous negotiation whatever, but rather with unasked liberality, the Sultan, without any previous negotiation whatever, but rather with unasked liberality

MAORI CHIEF, AND CARVED STERN OF A NEW ZEALAND CANOE.

Bay—a place near to the town, but without its limits—no further manifestation has been made, and I think it may safely be said that the crisis of the affair is over. The cause of the determined and vindictive spirit they have evinced arises from the fact of an individual of the lowest class among them—in fact, a slave—having presumed to strike one of their highest chiefs, and he, too, rendered sacred and untouchable for the time by means of the mystical *Tapu*. That they would seize and murder the policeman were it not for fear of the Europeans, and because they really have no enmity against, but rather a wish to conciliate them, there can be no doubt. As for the poor fellow himself, he remains close in Mr. Beckham's house, in daily fear of his death, which he himself says is certain. What Sir George Grey will do with him, is not yet known—most likely send him to Sydney or England; in New Zealand certainly his life is in jeopardy. Altogether, in spite of such a warlike demonstration, there has been little or no fear for themselves felt by the Europeans; and while it shows from what apparently trifling causes will spring the deadly vengeance of the savage, it offers no reasonable grounds to dissuade any intending emigrants from availing themselves of the open and fertile lands, the splendid climate, the increasing wealth of New Zealand in general, and of Auckland in particular.

By the submission of the rebel, the Maori chief is dispersed, without any further manifestations of disturbance.

The accompanying Illustrations are from Sketches by Mr. O. W. Brierly.

Here we have a Chief of Maoris, who, according to the testimony of the best informed writers upon the subject, are a superior race, capable of high civilisation, which we may one day see living peacefully in cities, villages, and hamlets, industrious, and contributing as much to the prosperity of New Zealand as the white settlers themselves; indeed, a considerable fusion of the races is already going on.

Beside the Chief is the elaborately-carved head of the war-canoe, such as we recollect seeing the illustrations of Cook's Voyages. These canoes are of great length, gaily painted red, and ornamented with white feathers and the sea and stern richly carved. Like other nations, the New Zealanders have various high-sounding names by which they designate their war canoes: for example, "*Mountain*," or "a slaying and devouring fire." It is not unfrequent to find, at the head of their canoes, figures and ornaments designed by the Chiefs to whom they belong.

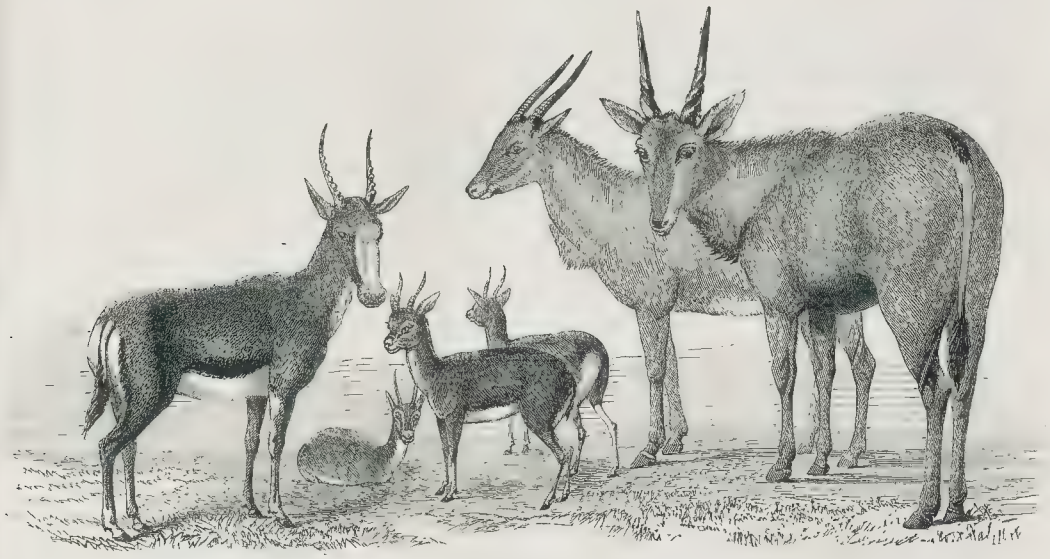
Beneath the Illustration is a View of the town of Auckland, with H.M.S. *Fly* at anchor, and the advance of the war-canoe.

Though Wellington is the commercial Metropolis, and the political capital of New Zealand, being the seat of Government, it was selected in 1840, by Governor Hobson, strategically enough, for its position in the Island, and the nearest northern settlement, but about 500 miles from the Straits. The situation is considered preferable to that of Wellington, as, besides possessing a safe and capital harbour, it boasts of large tracts of land available for cultivation in the immediate vicinity of the town. The climate, also, is more genial than that of Port Nicholson, being less subject to the south-east gales which blow with such terrific violence through the funnel of Cook's Straits.

The town itself presents an unattractive aspect, and has never been a favourite with the emigrant, yet a population of more than 2500 has been attracted to it. Many of the houses in Auckland are good. The barracks stand on the summit of a hill, looking over the harbour; and the church is a conspicuous object from the sea. The Government House is placed upon a lawn looking towards Hauraki Gulf, across which a most extensive and varied prospect opens of picturesque islands, with the blue mountains of the Great Barrier visible seaward.

THE TOWN OF AUCKLAND.

THE EARL OF DERBY'S MENAGERIE, AT KNOWSLEY.



BOUTE-BOK. GAZELLES. MALE AND FEMALE ELANDS.

It has been rumoured, upon the faith of a statement which appeared in some of the papers, that the whole of this collection was bequeathed by the late Earl of Derby to the Queen, and that, in the event of her Majesty declining the bequest, it was to be presented to the Zoological Society of London

This erroneous impression appears to have originated in the fact of the late Earl having expressed a wish that a specimen from the collection should be offered to her Majesty's choice, and it is stated that the Royal selection is expected to be made in favour of the group of eight black-necked swans, a most rare and beautiful species, specimens of which appeared in our Paper of last week. The Earl is, likewise, understood to have signified a wish that the Zoological Society should be offered a similar choice, and this, it is understood, has fallen upon the group of elands, the only living examples in this country, consisting of two males and three females, one of which was bred at Knowsley. A pair of these fine animals, male and female, are given in the accompanying Engraving, grouped with three specimens of the gazelle, one of them likewise bred at Knowsley; and the bonte-bok, whereof there is in the collection a group of four, two males and two females, one of the former, the specimen represented, bred at Knowsley. The eland, which is the largest of the antelope kind, measures, when full grown, five feet in height at the shoulder, and, from the mildness of its nature and the excellent quality of its flesh, which is more esteemed than that of any of the other wild animals of South Africa, it might be worthy of an attempt to naturalise the species in our parks, both as a harmless and noble ornament, and for the sake of a variety at the table. The docility of this species is such, that to save the burthen of conveying such a heavy carcase, the old bulls weighing about 8 cwt., it is the practice of the African hunters to ride into the midst of the herds in which they congregate, in order to select the full-grown males, and turn them in a homeward direction before bringing them down. The large muscles from the thighs of this animal, when dried and cured, produce an esteemed article of diet, called by the Cape colonists the biltong. The gazelle is found in Egypt and North Africa, and may be seen faithfully represented upon the ancient monuments of the former country and Nubia. The bonte-bok, or painted goat

MALE AND FEMALE HOG-DEER.

MASKED PARROT.

HERD OF INDIAN ANTELOPES.

of the Dutch colonists of South Africa, is so called from the peculiar markings and japanned appearance of its colours. It is likewise called bless-box, or blaze-buck, in reference to its white face, similar to the mark called a blaze in horses.

The second group represents a male and two female hog deer, a favourite object of sport to the Indian hunter. A peculiar habit in this species, of stamping with a quick jerk of the fore knee, is conveyed in the engraving. Seven of this species, bred at Knowsley, are in the Menagerie.

The subject of the third Illustration is the masked parrot of the South Sea Islands, the only living specimen, we understand, in this country.

The fourth group represents a herd of the Indian antelope, six of which were bred at Knowsley. These animals, remarkable in their native state for their extreme shyness, have retained their original wild nature, and are only to be approached with great caution, lest in their pause they should bound over the fence. They are represented in the accompanying Illustration in the performance of a series of long and lofty springs, which they exhibit upon the least alarm from the approach of strangers. Captain Williamson states, in his "Wild Sports of the East," that he has seen an old buck antelope of this kind lead a herd of females over a net at least 11 feet high, and that they frequently vault to the height of 12 or 13 feet, and pass over 10 or 12 yards at a single bound. This curious sight has not often been enjoyed at Knowsley, on account of the careful consideration which is extended towards the preservation of the animals from alarm or disturbance of any kind, such as might be detrimental to their health and safety.

CALENDAR FOR THE WEEK.

SUNDAY, October 5.—Sixteenth Sunday after Trinity.
MONDAY, 6.—St. Faith
TUESDAY, 7.—Sun rises 6h. 12m.
WEDNESDAY, 8.—Eddystone Lighthouse finished, 1759.
THURSDAY, 9.—Dutch fleet defeated, 1797.
FRIDAY, 10. Oxford and Cambridge Terms begin.
SATURDAY, 11.—Canova died, 1822.

TIMES OF HIGH WATER AT LONDON BRIDGE,

PRINCE of WALES' BAZAAR and COSMORAMA, 207 to 209, REGENT STREET. The elegant and fashionable BAZAAR fitted up in a style of [illegible] and [illegible] and [illegible] and

METROPOLITAN NEWS.

ELECTION OF LORD MAYOR FOR THE ENSUING YEAR.

On Monday a Common Hall was held for the purpose of electing a Lord Mayor for the ensuing year.

The Lord Mayor, the aldermen, the two new Sheriffs, Mr. Cotterell and Mr Swift, the Recorder, and the other City officers, assembled in the Guildhall, in their state dresses, soon after ten o'clock, and proceeded to St. Lawrence's church to hear Divine service, immediately after which the proceedings commenced.

The Recorder, in the usual form, called upon the senior alderman in rotation to the chair, Alderman Hunter and Alderman Challis, the Court of Aldermen elected Alderman Hunter, the senior Alderman, to fill the office of Lord Mayor for the ensuing year.

Alderman Hunter, the Lord Mayor elect, amidst loud approbation, expressed his readiness to take upon him the office of Chief Magistrate, the important duties of which he would, he assured the livery, use his best exertions to perform to the satisfaction and benefit of his fellow-citizens. (Cheers.) He was aware of the difficulties every one who undertook the responsible functions of the mayoralty would have to encounter, and he, therefore, felt that he should look to the guidance to his fellow-citizens for forbearance as he proceeded to acquit himself of the task. (Cheers.) He would not make professions, but he trusted that at the conclusion of his year of office they would have no cause to regret the honour they had so unanimously conferred upon him.

A vote of thanks to the late Sheriffs, Sir Robert Walter Carden and Sir George Hodgkinson, for the admirable manner in which they had performed the duties of the shrievalty for the past year, and the acknowledgment of the compliment by those gentlemen, closed the proceedings.

In the evening an induction of the Lord Mayor elect to the civic hospitalities took place at a dinner given by the retiring Lord Mayor to his successor, and the members of the Court of Aldermen, at the Mansion House. The entertainment took place in the Long Parlour. The guests incuded the new Sheriffs, Messrs. Swift and Cotterell, the late Sheriffs and their chaplain, the City officers, and several of the Lord Mayor's private friends. Covers were laid for seventy.

SWEARING-IN THE SHERIFFS OF LONDON AND MIDDLESEX.—On Saturday, the ceremony of administering the oath to Thomas Cotterell, Esq., citizen and cordwainer, and James Swift, Esq., citizen and spectacle-maker, the sheriffs for the year ensuing, took place at the Guildhall with the customary observances. The ceremony, T. T. the senior, has always a dejeuner à la fourchette to the civic authorities, at Cordwainers' Hall, and from thence went in procession to the Guildhall, where they were installed with the chains of office. The most important of the day was the appearance of Father Ignatius, of Islington, a Roman Catholic priest, in full canonicals, as chaplain to Sheriff Swift, who is of that persuasion.

IMPROVEMENTS IN BILLINGSGATE MARKET.—The extensive erections at Billingsgate for the purposes of the fish market are progressing rapidly. The elevation fronting the Thames already presents a prominent appearance. The dock in which the oyster-boats used to anchor, while unloading, has been filled up, and the front of the new market erected on the site. The old fish dock with the Custom House quay. The building is of brick, upon a foundation of Aberdeen granite, the corner of the clock tower and offices being ornamented with rusticated quoins of Portland stone. The passage to the market from the river vessels are spacious, the whole of the superstructure above them being supported by neat substantial iron pillars. The tower in the centre of the front of the market facing the Thames is surmounted by a gilt dart flying fish, and in the body of it will be placed a clock of large dimensions, which will show the hours on each of the sides. The whole of the most unsightly building now standing, hitherto used as the fish market, will be taken down, and a spacious light iron and glass roof erected upon iron pillars for the upper market. The cost of the ventilation, water supply, &c., is estimated at £1840.

RIGHT OF VOTING OF THE CHARTER-HOUSE BRETHREN.—At the Finsbury registration, on Monday, Mr. Macqueen decided that the brethren of the Charter-house have a right to be placed on the list of voters. The case was raised upon the claim of J. G. Traine Banister; and in giving judgment, the learned barrister said:—"All the requirements of the statute seem to be complied with enacting part and in the proviso, seem to be fully met and answered by the case of the claimant, unless there be something in his *status* as one of the brothers of the Charter-house that must exclude him from the franchise. It is said he lives on charity; so likewise do the fellows of a college. They live on charity, if by charity is meant the bounty of their founders; but they are not on that account excluded from the civil right of exercising the elective franchise as citizens. By the deed of foundation, the eighty brothers of the Charter-house are to be gentlemen by descent, merchants ruined by the disasters of commerce, or soldiers, mariners in the service of their country. From the moment of his admission each brother is independent. They cannot be displaced or disturbed at the caprice of a governor. They seem to me to have a higher estate than is required for the purpose of the legislature. I am therefore of opinion that Mr. Banister's claim is well founded; and I comply with it accordingly." The name was then inserted. The result of this judgment will be next year to admit to the franchise 80 "poor brethren" of this establishment, independently of other similar institutions in different parts of the kingdom.

NONCONFORMIST NEW COLLEGE.—On Wednesday the college recently erected by the Independent denomination of dissenters in the Finchley-road, St. John's-wood, was opened with an inaugural address from the Rev. John Pye Smith, D.D., the Rev. Dr. Harrison, in the presence of a numerous body of his co-religionists. The new college is the result of a union of three existing similar institutions, at present belonging to the Independents, viz., Coward, Homerton, and Cheshunt Colleges; and it is anticipated from such a concentration of Nonconformist resources and energies, hitherto divided, that the standard of sacred and theological learning among the preachers of that community will be considerably raised. The college is an extensive building, constructed of Bath stone, and comprises some eight or ten lecture-rooms, a library, a museum, and a laboratory; and at the north end there is a residence for the principal of the institution. The entire frontage stands about 250 feet in length, having a tower in the centre, under which is the chief entrance. The hall is lined throughout with stone, and connected with it is a handsome staircase leading to the upper floor. The chapel, which is behind the south side of the edifice, is a lofty room 60 ft. by 25 ft. on the plan, with an open timber roof, the walls being of stone; and the shelf accommodation (which is expected to be entirely filled) is sufficient for 20,000 volumes. The central tower is 86 feet in height, and commands an extensive view of the metropolis and the surrounding country. Besides the entrance hall, it contains the council-room on the first floor, philosophical lecture-rooms, and the laboratory. The whole of the interior dressings are of Caen stone, and the joiner's work and the fittings throughout are of oak. The ceilings are of wrought wood-work exhibiting their construction, those of the museum and the council-room being highly ornamented. The entire fittings have been carefully designed in harmony with the style of the building, which is of a Tudor date. The front elevation is of considerable elegance, and the principal features are a beautiful oriel window at the front, and the end windows of the library, which are of a rich and rather elaborate design. The architect, Mr. Emmett, of Hattongarden, has evidently bestowed the strictest attention to rendering the building perfectly consistent in its design with the purposes it has attained to, and the unity of his design is certainly remarkable, considering that the whole work has been executed in the space of eighteen months. The total cost of the structure is estimated at about £20,000. A cool collation closed the day's proceedings.

SURREY NEW COUNTY GAOL.—On Wednesday, the newly-erected House of Correction, on Wandsworth-common, was opened for the reception of prisoners. It is on the cellular principle, the same as Pentonville, and is calculated for 750 prisoners.

THE NEW-ROAD.—On Wednesday, at the meeting of the vestry of St. Pancras, a resolution was carried directing the surveyor to pave the roadway of the New-road, between St. Pancras Church and King's cross, with the granite blocks transversely, that portion with which they are at present proceeding being paved diagonally. The object is to set at rest by practical experiment the disputed point of whether the granite block-paving laid diagonally or transversely is most durable.

ST. PANCRAS ALMSHOUSES.—Designs for the almshouses proposed to be erected by the parish of St. Pancras are now on display at the Vestry-hall, King's-road, Camden Town, where they are open to the inspection of the public daily from ten till four, except Tuesdays. A plot of more than an acre of ground has been purchased in a delightful situation, behind the Governesses' Asylum, Haverstock-hill, Hampstead. The buildings are to afford accommodation to near 400 inmates, of whom 28 are to be married couples. To render candidates eligible for this charity, it is only requisite that they shall have paid rates and taxes in the parish for ten years, shall have borne a good character, never received parochial relief, and be above 60 years of age, and in indigent circumstances. The sum already subscribed amounts to £1400, and as soon as £800 more shall have been collected the first six of the houses will be forthwith erected, offering a home to about 30 persons.

A BLOOMER NO MARTYR.—A meeting, convened by the advocates of the new American costume, was held in the British Institution, Cowper-street, Finsbury, on Monday night. It was announced that the proceedings would commence at half-past eight o'clock, and that Mrs. C. H. Dexter would address the meeting. Long before seven o'clock the large hall was densely assembled in front of the building, and though the populace was extremely dense, the mob remarkably violent, and the demands for admission indescribably clamorous, the clock struck eight before the doors were opened. As may be readily imagined, the assembled persons pressed with great zeal into the building, some were trodden down, others fainted, and the large hall, which is capable of holding from 1200 to 1800 persons, rapidly filled. The prices of admission were fixed at 6d. for the hall, 3d. for reserved seats, 6d. and for the platform, 1s.; but, owing to the want of arrangement that prevailed, not one out of a hundred who entered the building paid anything for admission. The interval which elapsed between the admission of the audience and the time appointed for the entrance of the Bloomers was passed in a most disorderly manner. All sorts of jokes and witticisms were bandied about, and soon very many remarks were made at the expense of the dress reformers. As the principal performers were after time, it was suggested that a grand chorus of "Buffalo Gals, can't you come out to night" would be an appropriate invitation to expedition. Soon after this, a person, said to be one of the vergers of St. Paul's Cathedral, a portly-looking man, placed himself in the presidential chair, and was loudly but ironically cheered. Alarmed, apparently, by the riotous character of the assembly, the female lecturer did not make her appearance, and a great disturbance took place, many of the audience declaring their intention to take legal steps to recover the money they had paid at the doors.

INAUGURATION OF THE NEW SHERIFFS.

On Tuesday the new Sheriffs of London and Middlesex—Thomas Cotterell and James Swift, Esqrs.—were presented to the Court of Exchequer before Mr. George Baukes, M.P. for Dorsetshire, the Curitor Baron, according to ancient custom, to receive through him her Majesty's sanction to their election.

The Sheriffs were introduced by the Right Hon. J. Stuart Wortley, M.P., the Recorder for the City. The right hon. gentleman and the Sheriffs were accompanied by the Right Hon. the Lord Mayor, several of the aldermen and members of the Common Council, and City officers.

The learned Recorder, in introducing the Sheriffs to the learned Baron, in a neat and appropriate speech, paid a compliment to each for his public and private virtues.

The Curitor Baron then expressed her Majesty's approbation of the choice of the citizens in the election of Sheriffs for the ensuing year, and concluded by congratulating the late Sheriffs on the successful termination of their year of office.

The ceremony ended by the Recorder inviting the Curitor Baron to dine with the new Sheriffs in the evening, which invitation the learned Judge accepted, and the proceedings terminated.

THE INAUGURATION BANQUET.

In the evening, the Sheriffs, after having returned from Westminster, entertained upwards of 170 of their friends at Cordwainers' Hall, in the City

Amongst the guests present were—Mr. Sheriff Cotterell, Mr. Sheriff Swift, the Lord Chief Baron, Mr. Justice Talfourd, the Lord Mayor elect, Alderman Kelly, Alderman Humphery, Charles Oldham, Esq., Alderman Wilson, Serjeant Merewether, Rev. Dr. Vivian, Rev. Dr. Rice, Rev. Mr. O'Connor, Alderman Farncomb, Alderman Challis, Alderman Sidney, Alderman Moon, J. S. Hardcastle, Esq., M.P., John Masterman, Esq., M. P., the Curitor Baron (G. Baukes, Esq.), Lord Erskine, Herbert Ingram, Esq., Alderman Finnis, Alderman Carter, John Hill, Esq., Master of the Spectacle-makers' Company, Mr. Isherwood, Mr. Nason, and others.

"Non nobis Domine" having been most effectively sung by the vocalists, Messrs. George, Holmes, Master H. Holmes, Perrin, and F. Smith,

Mr. Cotterell proposed "The health of her Majesty the Queen." In doing so he said that on that day her Majesty had signified her most gracious approval of the appointment of his colleague and himself, who had been chosen by the Court of Aldermen to serve the office of sheriffs for the ensuing year. With the strongest sentiments of loyalty on both their parts to the Sovereign, he begged to give at once the toast of the "Queen."

The toast was drunk most enthusiastically.

Sheriff Swift then gave, "Prince Albert, Albert Prince of Wales, and the rest of the Royal Family," in a neat speech, in which he highly eulogised the conduct of the Royal Highness Prince Albert, who, he remarked, in the memorable year of 1851, had entitled himself, by the noble disinterestedness he had manifested in the promotion of the assemblage of the industry of all nations at the Crystal Palace, to the respect and love of every Englishman. (Cheers.) It was, therefore, with the greatest pleasure that he proposed the health of his Royal Highness and the rest of the Royal family, who, he was sure, coming from such a stock, would do due honour to the country in years yet to come.

The toast was honoured with the live less demonstrations of applause.

The toast of "The Army and Navy" was also heartily drunk, and replied to by Major Hamilton, who said that the Peninsula and Waterloo men were fresh in the recollection of the public, and by Captain Hine, of the Royal navy.

"The Health of the Lord Mayor" was then drunk with the usual honours, and was followed by the glee, "Blow gentle gales," admirably given by the vocalist party.

Sheriff Cotterell then gave "The Lord Mayor Elect."

Alderman Hunter, the Lord Mayor elect, said, in reply to the honour which had been done to him by the toast, that he should do his best during the year of office to serve the interests of his fellow-citizens. He felt himself incapable of performing the duties entrusted to him, but he trusted indeed he was quite sure, that he should have the sympathy of every member of the corporation, with which body he (the Lord Mayor elect) had been connected for upwards of a quarter of a century. ("Hear, hear," and cheers.) He had filled the various offices in the corporation prior to his election as an alderman, and he should never forget the kindness of feeling which was manifested when he was elected one of the magistrates of that great city. His utmost desire was to maintain the rights and privileges of the City of London; and if Providence permitted him to fill the office during the ensuing year, he would do his best to advance the interests of his fellow-citizens and promote the advantage of the country at large. (Cheers.) He therefore hoped that when his term of office expired he should resign his trust into the hands of his fellow-citizens without any tarnish upon the fame of the corporation or of those who had preceded him in office. (Cheers.)

The Lord Mayor elect then proposed "The Healths of the Sheriffs," which was responded to by Mr. Sheriff Cotterell and Mr. Sheriff Swift in warm terms; after which followed, "Lord Justice Talfourd and the Bench," "The Curitor Baron," "The Members and the House of Commons," "The Cordwainers' and the Spectacle-makers' Companies, with their Masters and Wardens," "The Under-Sheriffs," &c.

CITY OF LONDON REGISTRATION.—THE COMPOUND HOUSEHOLDERS' REGISTRATION ACT.—Mr. T. Y. M'Christie proceeded, at the sitting of the Court on Tuesday, to dispose of an important question arising on the construction of the recent Amended Registration Act. He said:—The first case for the decision of the recent Amended Registration Act. He said:—The first case for the decision of the recent Amended Registration Act. He said:—The first case for the decision

DEATH OF JAMES FENIMORE COOPER.

By the steam-ship *America*, arrived at Liverpool on Sunday, was received the sad intelligence of the death of this distinguished writer.

James Fenimore Cooper, one of the greatest novelists that modern fiction has produced, was born at Burlington, New Jersey, on the 15th September, 1789. His father, the late Judge Cooper, was a large landholder in Otsego county, in the state of New York, and resided alternately at Burlington, and at Cooperstown, in New York state—a place which owes its name to him, and which has since increased in reputation from being the permanent abode of his very eminent son. Cooper the younger received the rudiments of a classical education under a private instructor at Burlington, and, advancing in his studies, continued them with an Episcopal clergyman in Albany, and by him was prepared for Yale College, which he entered in 1802, when scarcely past thirteen years old. Although so young, he soon stood high in his class, and is said to have outstripped every competitor in the department of ancient languages. But he did not long remain a student: a native passion for the sea, and an unconquerable love of adventure, led him, among other causes, to solicit admission into the American navy; and in the year 1806 he entered the service as a midshipman, and continued in it for six years. Here it was that he acquired that fine knowledge of nautical affairs, and that brilliant conception of the reality and romance of the ocean, which are stamped upon his magnificent marine narratives and descriptions. In the year 1810 Cooper quitted the navy, and married, and took up his abode at Westchester, in the vicinity of New York. He staid here but a short time, when he removed to his patrimonial estate at Cooperstown, and proceeded in earnest in his career as a writer of fiction. He had previously published his maiden novel, entitled "Precaution," a work which made little sensation, and gave no note of his future fame. The following fifteen years, however, during which he successively produced "The

THE LATE JAMES FENIMORE COOPER.

Spy," "The Pioneers," "The Pilot," "Lionel Lincoln," and "The Last of the Mohicans," established his repute as a novelist of no common order, even at a time when Sir Walter Scott was in his zenith. Soon after the appearance of the "Last of the Mohicans," in 1826, Mr. Cooper sailed for Europe, where he sojourned for several years, during which time he wrote many of his most popular works, including "The Bravo," "The Red Rover," and "The Prairie." His reception in Europe was everywhere warm and cordial, and he became a welcome visitor in the highest and most distinguished circles. His productions since his return to the United States have been very numerous; of these, "The Pathfinder," "The Destroyer," "The Two Admirals," and "Wing-and-Wing," sustained his fame. Some others showed signs of declining powers; and latterly it is to be regretted that he mingled up political disquisition with fiction. In this, strange to say, he displayed a failing somewhat similar to that of his great predecessor, Smollett, whose historical and political works, though separate, in his case, from his admirable sea novels, did aught but enhance his reputation. Eugène Sue, formerly an able rival of Cooper in marine romance, has lapsed still more grievously into the same error; his latter productions, both in politics and morality, being a burlesque in imaginative literature, and most unworthy of himself. But Cooper, though wrong in taste, was unimpeachable as a moral writer. He ever evinced all the virtue and the purity of Sir Walter Scott, and he will go down to posterity in his works, as a luminary of minor magnitude it may be, but of no less chaste brilliancy than the great magician himself.

Mr Cooper, after an illness of some months, died at his own home, in the bosom of his family, at Cooperstown, on the 14th ultimo. He leaves a widow and children, as well as a whole nation, whole literature he glorified, to mourn his irreparable loss.

The accompanying Portrait has been engraved, by permission, from a plate in Griswald's "Prose Writers of America," published by Mr. Bentley.

LAUNCH OF THE "DEMERARA," ROYAL MAIL STEAM-SHIP.

The launch, or, more properly speaking, the floating-out of another of the colossal steam-ships, of which five have been constructed at different ports for the Royal West India Mail Steam-Packet Company, the *Demerara*, took place at Bristol on Saturday, where she has been constructed by the Messrs. Patterson, so well known as the builders of the *Great Western*, the *Great Britain*, the *Avon*, the *Severn*, &c. The morning being a remarkably fine one, large numbers of persons assembled to witness the floating out; and the various vessels in the floating harbour being dressed gaily, the entire scene presented a most animated appearance. Owing, however, to some delays, and the water having fallen some eighteen inches or two feet, the spectators were doomed to disappointment, as she could not be got out until the evening's return of tide, when she floated gracefully upon the water, having been christened duly by the lady of Lieut. Hast, R.N., the Commodore of the West India squadron, and future commander of the *Demerara*. With the exception of the *Great Britain*, the *Demerara* is, we believe, the largest steam-ship afloat. Her length of keel is 276 feet; length between the perpendiculars, 282 feet; length over all, 316 feet 3 inches, or about 6 feet shorter than the *Great Britain*. Her breadth of beam is 41 feet 4 inches, and the extreme width, from the outside of the paddle-boxes, 72 feet 3 inches; depth to the main deck, 26 feet 8 inches; depth to spar deck, 34 feet. Tonnage—by old measurement, 2313 tons; by new measurement, 3126 tons. She is built of sound British oak, teak, and pine, is diagonally trussed with iron, has copper sheetings throughout to the 21 feet mark, and iron fastenings above that. She will be propelled by two engines made by Messrs. Caird and Co., of Greenock, which will be constructed on the side lever principle, of the combined power of 750 horses, or 24,500,000 lb., 86-inch cylinders, and 9 feet stroke, and they will be attached to a pair of Morgan's patent feathering float-paddles, 40 feet diameter.

An elegant *déjeuner* was afterwards given at the White Lion Hotel, at which between forty and fifty gentlemen sat down, presided over by Mr. Patterson—supported upon the right and left by Captain Mangles, one of the directors of the Royal West India Mail Company, and Lieutenant Hast, R.N., the Commodore of the Company. All the nautical gentlemen present were loud in their praises of the beauty of her model, and the excellence of her workmanship, and stated that of her sailing powers they entertained no doubt.

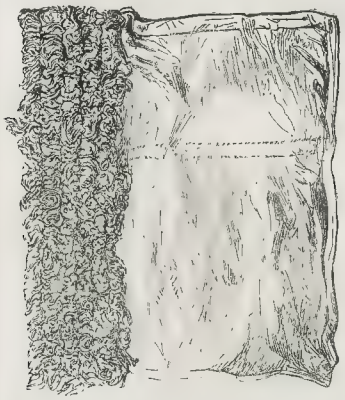
LAUNCH OF THE "DEMERARA" ROYAL MAIL STEAM-SHIP, AT BRISTOL.

TRACES OF THE FRANKLIN EXPEDITION.

MEAT-CANS AND SACKS, LEFT BY THE "EREBUS" AND "TERROR" AT CAPE RILEY.

THE reader will, doubtless, recollect that the most interesting intelligence recently brought by Captain Penny, from Captain Austin's expedition, was the confirmation of the discovery of the three graves and the other traces on Beechy Island, Franklin's first winter quarters, known some time since.

Captain Penny's Report states that on August 25, on the east side of Wellington Channel, he landed with a party, and examined the coast from 10 miles to the northward of Cape Spencer to that promontory, and an encampment was found near the latter place, seemingly that of a hunting party about three years previous. A party of all Captain



ROPE-MAT, UNFINISHED.

Penny's officers, who had been despatched in the direction of Caswall's Tower, discovered the quarter which had been occupied by the vessels of Sir John Franklin's expedition in the winter of 1845-46. Three graves were also found, the headboards showing them to be those of three seamen who had died early in the spring of 1846; but, notwithstanding a most careful search in every direction, no document could be discovered.

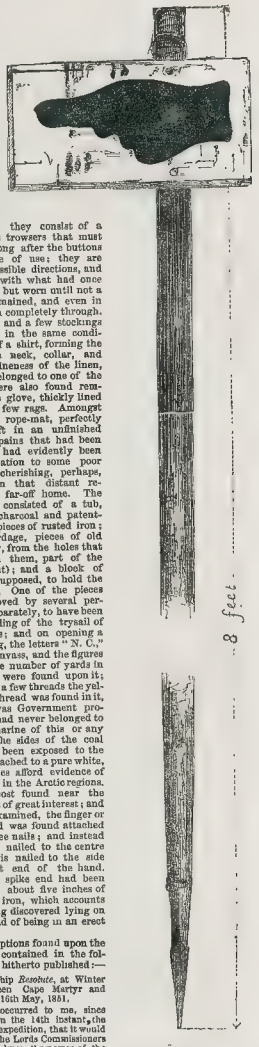
The following relics have been brought home by Captain Penny, and have been minutely examined by Commodore Superintendent Sir Edward Parry, Captain F. W. Beechy, and Dr. Richardson (the explorers of various parts of the Arctic regions), with Mr. John Barrow (of the Admiralty), at the offices of Commodore Henry Eden, Superintendent of Woolwich Dockyard; when the examination satisfied all present that the articles in reality belonged to the crews of the missing vessels.

Our Artist has sketched the principal of the relics.

The several articles were discovered lying strewed about on the beach. Four sacks, one of them marked with the Government mark (the broad arrow), were found, and filled with the mass brought away; the incontestible proof of their having belonged to the ships missing is a piece of canvass, on which is faintly perceptible the word *Terror*. It appears it is customary to lay out in one of the stores in the dockyard, until required, the canvass belonging to the ship, whose name is written on the or[illegible]

THE SMITH'S ANVIL-BLOCK

with charcoal; the piece mentioned was so written on by one of the persons employed in the dockyard, and was recognised by him during the time our Artist was present. It is conjectured that the place had been quitted in a hurry, in consequence of the ice breaking up sooner than was expected; and that the crew had left behind what was of no further use to them. The direction-post had formed one of a number set up as guides for the seamen on their return from excursion parties to the ship; this, it is supposed, in their haste in collecting them, had been overlooked; and, from its being found lying on its face, been afterwards blown down. It consists of a flat piece of board, 13 inches long by 6½ wide, nailed to a boarding-pike, 8 feet in length: the back of the board, and the pike a few inches below it, is perforated with a quantity of swan-shot, some of which remain imbedded in the wood. Among the other articles are several tin canisters, used for containing preserved meats; these were found piled up in a heap on the beach: one of the crew states that he counted upwards of 700 of these canisters. A few remnants of clothing brought over denote the situation of the wearer to have been deplorable: they consist of a pair of seaman's trowsers that must have been worn long after the buttons had ceased to be of use: they are mended in all possible directions, and evidently patched with what had once been thick flannel, but worn until not a vestige of nap remained, and even in many places worn completely through. A pair of drawers and a few stockings were found much in the same condition; a portion of a shirt, forming the back part of the neck, collar, and back, from the fineness of the linen, had most likely belonged to one of the officers. There were also found remnants of an elastic glove, thickly lined with wool; and a few rags. Amongst the heap was a rope-mat, perfectly bleached, and left in an unfinished state; from the pains that had been taken with it, it had evidently been a pleasing occupation to some poor fellow, a task cherishing, perhaps, in his mind, in that distant region, thoughts of far-off home. The rest of the heap consisted of a tub, partly filled with charcoal and patent-fuel dust; some pieces of rusted iron; some bleached cordage, pieces of old canvass (probably, from the holes that had been cut in them, part of the covering of a tent); and a block of wood, used, it is supposed, to hold the anvil of the smith. One of the pieces of canvass was proved by several persons, examined separately, to have been a part of the binding of the trysail of one of the vessels; and on opening a part of the binding, the letters "N. C." meaning naval canvass, and the figures "35," meaning the number of yards in the original piece, were found upon it; and on unweaving a few threads the yellow Government thread was found in it, proving that it was Government property, and that it had never belonged to the mercantile marine of this or any other country. The sides of the coal sacks which had been exposed to the sun have been bleached to a pure white, and all the articles afford evidence of their having been in the Arctic regions.



DIRECTION-POST SET UP BY THE MISSING NAVIGATORS.

The direction-post found near the graves is an object of great interest; and on being closely examined, the finger or painted handboard was found attached at the top by three nails; and instead of the post being nailed to the centre of the board, it is nailed to the side nearest the wrist end of the hand. When found, the spike end had been broken off within about five inches of the point of the iron, which accounts for the staff being discovered lying on the ground, instead of being in an erect position.

Copies of inscriptions found upon the three graves are contained in the following letter, not hitherto published:—

Her Majesty's Ship *Resolute*, at Winter Quarters between Cape Martyr and Griffith Island, 16th May, 1851.

Sir,—It having occurred to me, since briefly reporting, on the 14th instant, the proceedings of this expedition, that it would be satisfactory to the Lords Commissioners of the Admiralty to know the names of the three persons, late of the expedition under

THE THREE GRAVES AT CAPE RILEY, BEECHY ISLAND.

CANVASS FROM THE "TERROR."

Sir John Franklin, whose graves were found at Beechy Island. I have the honour to state that the following are copies of inscriptions upon the headboards; viz

Sacred to the memory of John Torrington, who departed this Life January 1st, A.D. 1846, on board of her Majesty's ship *Terror*—aged 20 years.

Sacred to the memory of John Hartnell, A B, of her Majesty's ship *Erebus*; died January 4, 1846 aged 25 years. "Thus saith the Lord of Hosts, consider your ways."—Haggai, chap. 1, v. 7.

Sacred to the memory of W. Braine, R.M., of her Majesty's ship *Erebus*, who died April 3rd, 1846—aged 32 years. "Choose you this day whom you will serve."—Joshua, chap. ii. 4th part of the 15th verse.

I also take the opportunity to transmit herewith a small Sketch of the tombs and immediate locality —I have the honour to be, Sir, your most obedient servant,

(Signed) HORATIO T. AUSTIN,
Captain in charge of the Expedition.

The Secretary to the Admiralty, London.

We have gleaned some entertaining particulars of the mode in which the crews of the *Sophia* and the *Lady Franklin* whiled away the tedium of their sojourn. On the after-deck of the larger vessel, the *Lady Franklin*, they constructed a stage, upon which they gave some theatrical performances, their audience being collected from the ships stationed around them, several lying within eighteen miles. They had also some type and a printing-press on board, from which they printed their play-bills, headed "Royal Arctic Theatre," and embellished with a very creditable wood-cut of the Royal Arms, engraved in the Arctic regions, and the first attempt in the *art* of a gentleman belonging to the Expedition. The explorers also got up an *Illustrated Arctic News*, the illustrations of which consisted of penuil sketches and water-colour drawings, executed by themselves. The paper was circulated from ship to ship.

THE NORTH-WEST SEARCHING EXPEDITIONS FOR SIR J. FRANKLIN.

Admiral Sir John Ross, in command of the Arctic expedition, arrived in the *Felix* schooner, off Stranraer, on the 25th ult., and anchored in the roads, and has also presented himself at the Admiralty. The *Felix* left the ice about the 18 h of August, nearly six weeks since. She brings no news of Sir John Franklin, and the opinion appears to be, that the search can only be effectually carried out by the employment of a screw steamer.

The return of Sir John Ross has afforded some parties the opportunity of reviving the highly improbable story, said to have been received from the Esquimaux, that the crews of the *Erebus* and *Terror* had been murdered by the Esquimaux; and now that there is no certainty of Sir John Franklin's officers and crews of the *Erebus* and *Terror* having buried three of their companions as late as April, 1846, the period of the murders said to have been committed by the Esquimaux has been postponed to the autumn of that year, instead of at a previous period, as was originally stated. The origin of the report of the murders of the missing navigators arose evidently from the ignorance of the interpreter who accompanied Sir J. Ross, as Captain Penny's more intelligent interpreter gave a widely different meaning to the statement of the Esquimaux; and the slightest credit is not attached by Captain Penny, or any of his officers or crews, to the report of murders having been committed by the Esquimaux.

The following important letter was received and posted at Lloyd's on Saturday morning last:—

"*Felix* Discovery Vessel, Stranraer, Sept. 25, 1851

"Sir,—I am to acquaint you that the American vessels *Advance* and *Rescue*, after wintering in the ice in Baffin's Bay, put into Godhaven (Leifs), in Disco; sailed from thence on the 21st June, 1851; and were spoken off Proven, in Greenland, on the 24th August, on their way to America, after a fruitless search for the missing ships. They have been sickly, and lost one or two men, but were now all well.

"The Danish Government brig *Hoafesken* arrived in Godhaven, in company with the *Felix*, on the 30th August; was to sail from thence on the 10th September, for Kron Prins Island, and thence to Copenhagen—all well

"The *Felix* parted with all the other discovery ships on the 13th Aug.; sailed from Godhaven on the 2d September, and arrived here this day, under my charge.

(Signed) "JOHN ROSS, Rear-Admiral, R.N.

"To the Secretary, Lloyd's, London.

"N.B. No traces of the missing ships were found since they wintered at Beechy Island, and left it in September, 1845."

RETURN OF CAPTAIN AUSTIN'S EXPEDITION.

We have also to announce the return to our shores of the chief expedition, under the command of Captain Austin, C.B., consisting of the *Resolute*, Captain Austin; *Assistance*, Captain Ommanney; *Intrepid*, screw-steamer, Lieutenant-Commander Bertie Cator; and *Pioneer*, screw-steamer, Lieut.-Commander Sherrard Osborne. The ships arrived off Scarborough on Sunday, and the *Intrepid* put into Yarmouth for a pilot.

Captain Austin's expedition got out of winter quarters on the 11th of August, when, as the gallant officer informed the Admiralty in his dispatch by Captain Penny, he made his way through Barrow's Straits, took the Wellington Sound by the way. Failing, however, to penetrate the Sound, in consequence of its being blocked up with heavy ice, he made for Cape Farewell, doubled it on the 16th of September, made the Orkneys on the 24th, and dashing through the heavy gale of wind last week in the North Sea, arrived off Scarborough on Sunday.

The following is a correspondent's letter announcing his arrival, and giving a short summary of the services of the expedition:—

"Her Majesty's Ship ———, Sept. 20, 1851, off Scarborough.

"Dear Sir,—I dare say you have heard all the news, Ross and Penny having, no doubt, arrived long since

"Arctic news must have become stale to the public; I shall, therefore, merely state, that, notwithstanding that we have been assisted by the strong arm of steam, we did not get through the Melville Bay barrier until the 10th of August, 1850. Examined Wellington Sound and made the entrances of Lancaster Sound on the 18th, made Cape Ilsley and Beechy Island on the 23d, and found traces of the missing expedition sufficient to prove that they had wintered at Beechy Island in safety in the rigorous season of 1845-6.

"Sept. 10. All of us got checked in our further progress to the westward by an impenetrable barrier of ice, so that the Government expedition, Captain Penny's, and the Americans, were all brought to a stand—the 'gent of the ice' declaring that 'thus far shall you come, but no farther.'

"On the 11th the *Intrepid* got steam up (having Capt. Ommanney on board), and made an attempt to get to Cape Walker, but thick weather and the state of the ice compelled her to return to the squadron. This was the last attempt to get to the westward; the squadron mooring to a floe between Griffiths and Cornwallis Islands in lat. 74° 30' N., long. 92° 20' W., where we spent the winter, and I believe with about the same degree of comfort as all other winters have been spent in those regions.

"Early in the spring preparations were made for travelling. Everything that human ingenuity could suggest was done to secure facility of motion and comfort, and on the 15th of April 14 sledges, manned with upwards of 100 seamen, started in various directions to search for our missing countrymen on the shores hitherto untrod by civilised man

"On the 4th of July, Lieutenant M'Clintock's, the last of the travelling parties, returned from Melville Island, having been absent 81 days. No traces of missing expedition.

"We got out of winter quarters on the 11th August; made an attempt to look into Jones's Sound, but could not approach from its being blocked up by heavy ice; rounded Cape Farewell on the 16th September, and made the Orkneys on the 24th, when we experienced a very hard gale of wind in the North Sea; but now, thank God, it is over, and we are all safe and well."

MEMORIAL FROM THE MANCHESTER ATHENÆUM.—The following communication from the Admiralty has been received by Dr. Hudson, secretary of the Manchester Athenæum, in reply to a memorial forwarded from that members of that institution on the subject of the missing Arctic expedition:—"Admiralty, Sept. 23, 1851.—Sir,—Having laid before my Lords Commissioners of the Admiralty your memorial, with the accompanying memorial from the members of the Manchester Athenæum, relative to a further search for missing expedition under Captain Sir John Franklin, I am commanded by their Lordships to acquaint you that my Lords cannot but feel gratified at the anxiety of the memorialists in behalf of the missing expedition; but having communicated with Captain Penny, and such naval officers as are most conversant with Arctic navigation, their Lordships are satisfied, from the report made to them, that no good end is likely to be attained by the despatch of a vessel at this season with a view of reaching Wellington Strait. I am, sir, your most obedient servant, W. A. B. HAMILTON.—*J. W. Hudson, Esq., Athenæum, Manchester.*

THE LAW OF EVIDENCE.—In the new act to amend the law of evidence, which will come into force on the first day of next month, there is a provision, the importance of which is not generally known, but which will prevent the necessity of suits in equity to obtain an inspection of documents. It is enacted, that "whenever any action or other legal proceedings shall have set forth or pending in any of the superior courts of law at Westminster or Dublin, or in the Court of Common Pleas for the county palatine of Lancaster, or the Court of Pleas for the county of Durham, such court, and each of the judges thereof, may respectively, on application for such purpose made by either of the litigants, compel the opposite party to allow the party making the application to inspect all documents in the custody or under the control of such opposite party, relating to such action or other legal proceeding, and, if necessary, to take examined copies of the same, or to procure the same to be duly stamped, in all cases in which previous to the passing of this act a discovery might have been obtained by filing a bill or other proceeding in a court of equity, at the instance of the party so making application as aforesaid to the said court or judge." By virtue of the new law, the common law courts in the ensuing Michaelmas Term will present some interesting scenes. The act has a retrospective effect with regard to the examination of plaintiffs and defendants both are not only competent, but "compellable," to give evidence.

LANDING THE SUBMARINE TELEGRAPH ON THE FRENCH COAST—CAVE THROUGH WHICH THE WIRE IS CARRIED, UP A SHAFT IN THE ROCK.

THE SUBMARINE TELEGRAPH.

The expedition of the *Blazer*, with the telegraph cable on board, and her consorts, the steam-tugs, in its outward bound course across the Channel, last week, encountered some unexpected and formidable obstacles: the most important of all was the discovering that the cable was half a mile too short to reach the shore. The first *contretemps* that occurred when a short distance out at sea was occasioned by its being discovered that no communication could be effected between the *Blazer* and the South Foreland, whereupon a mes enger was despatched in shore, and the difficulty at length adjusted. The next difficulty that arose was occasioned by the violent friction of the cable in process of paying out upon the rollers, blocks, and chocks, and this, in conjunction with the great strain upon it at intervals, it is feared, may lay the foundation of some permanent injury to the cable. Frequent "hitches" also constantly occurred, owing to the roughness and inequalities of the rope coming into contact with the sharp edges of the blocks and rollers; and in consequence of this, great caution had to be observed, owing to the unexpected "pitching" of the vessel, and the increasing roll of the sea. Another very delicate and difficult operation was that of regulating the speed of the towing vessels uniformly with the paying out of the cable, so as to prevent excessive strain.

These difficulties and dangers, at a later stage in the progress of the expedition, were increased, owing to the impossibility experienced in maintaining a steady delivery motion in dealing out the cable; but, in spite of the jeopardy of the process, those in charge of the convoy continued to persevere to the end of their twelve hours' stirring and continuous hazardous toil. At one period the position of things was really perilous, for the towing rope of the vessel attached to the *Blazer* broke, and the latter, borne along irresistibly by tide and wind, began to drift out and about without compass. Before another rope and tug could be lashed on to her the *Blazer* had diverged, it is calculated, from the given track, upwards of a mile and a half, and in consequence of this catastrophe, between four and five o'clock on Thursday, it was discovered that, owing to this "cast of way," there would not be sufficient length of cable wherewith to reach the coast. At about six o'clock the *Blazer* was accordingly brought to anchor some three miles off, with about 2½ miles only of cable on board. The other vessels were disbanded, and made for Calais harbour. On Friday, at high tide, attempts were made to compass the remaining distance, but it was found impracticable, in consequence of the high sea. In the afternoon, however, of the same day the *Blazer* was towed a mile nearer the French coast, and the cable, having been thrown overboard, was secured to a buoy at that point, from which a coil of gutta percha, in lieu of "cable," had been extended to the French shore, and thus the communication between coast and coast has been completed. The gutta percha that now connects the cable at the buoy with the French coast, had fortunately been sent over in a coil of four miles for inland use before the expedition started, and so came in opportunely. The cable, in addition to the buoy already mentioned, is secured to a second buoy about a mile and a half off the coast.

Intelligence was received at the South Foreland, at 6 P.M. on Sunday, by the submarine telegraph itself, of its satisfactory completion to the French coast, nine miles, 31 chains in miles and fathoms, between the South Foreland and Sangate:—One mile out, 5, 7, 12, 16, 14 fathoms; two miles out, 14, 14; three miles, 16; four miles, 17. 23; five miles, 22, 28; six miles, 30; seven miles, 31; eight miles, 30; nine miles, 27; ten miles 26, 25; eleven miles, 24; twelve miles, 21, 20; thirteen miles, 20; fourteen miles, 21; fifteen miles, 21, 19; sixteen miles, 20, 18, 17; seventeen miles, 15, 16; eighteen miles, 18, 13; nineteen miles, 13, 14, 15, 16, 8; twenty miles, 9, 8½; twenty-one miles, shore at Sangate. From this table it will, at once, be seen how great were the inequalities to which the cable had, in sinking, to accommodate itself.

The crew, on their return, as they were towed up from Calais to Wear, with on board the *Blazer*, where she is now in dock, encountered a tremendous passage. The *Black Eagle*, Captain Hutchings in command, left Calais with the *Blazer* at six on Friday morning, and arrived through a driving sea in Margate roads at 2 A.M. The *Blazer* having no ballast, and being nothing but a mere shell upon the breakers, rolled to and fro like a porpoise. The crew in the midst of the squall, being incessantly sick, could neither stand on their legs nor lie down, while the crockery and everything in the old hulk came rattling about their heads. At Margate, the *Monkey*, Government steamer, took them in tow to Woolwich, and they are now recruiting themselves about the works at Wapping.

On Monday a series of experiments were tried with the most satisfactory results; and as the same results were attained on Tuesday, the great enterprise may now be regarded as actually finished and complete. On Monday morning congratulatory messages to the President of the French Republic were sent direct from England to Paris, also to the King of Prussia and the Emperor of Austria, at Berlin and Vienna, and messages were also transmitted to London from the principal cities in Europe, who were included in the Continental system of telegraphic communication. During the whole of Monday, the town of Calais presented the appearance of a *fête*, and numbers of the inhabitants crowded on the ramparts, watching with interest and wonder the various experiments which were tried with the submarine wires. In the evening an entertainment was given at the Hôtel de Ville, to those English gentlemen, promotors of the undertaking, who were on the spot, and had assisted in its completion. Those were Sir James Carmichael, Mr. Crampton, C.E., Mr. Wollaston, and Mr. Tatham, of the Gutta Percha Company. M. Mayer, the Mayor of Calais, presided; and, in addition to the English guests, there were present MM. Legros Devot, representative of the people; De Hamel, Councillor of State and member of the Academy of St. Petersburgh; Dupont, Vice-Consul of Russia; and M. Benham, British Consul; together with the principal inhabitants of Calais, and the officers of the garrison. During the whole of the proceedings the utmost harmony prevailed. A portion of the electric coil is to be placed in the Museum of Calais, in juxtaposition with the balloon of the celebrated aeronaut, Blanchard, who, in 1785, made his first *aspra*-marine voyage from Dover to Calais.

THE CATACOMBS AT ROME, AND ASSYRIAN ANTIQUITIES. FRENCH ENTERPRISE.

The *Revue des Deux Mondes* publishes a statement which should stimulate us in this country to a noble rivalry with our enlightened neighbours. The statement is in effect that the French Government has lately made a literary acquisition of no ordinary interest and value. A French gentleman of the name of Perret has been engaged for six years in exploring the catacombs under Rome, and copying, with the most minute and unscrupulous fidelity, the remains of ancient art which are hidden in those extraordinary chambers. Under the authority of the Papal Government, and assisted by M. Sauluisa Petit, an accomplished French artist, M. Perret has explored the whole of the sixty catacombs, together with the connecting galeries. Burying himself for five years in this subterranean city, he has thoroughly examined every part of it, in spite of difficulties and perils of the gravest character—for example, the refusal of his guides to accompany him; dangers resulting from the intricacy of the passages, from the necessity for clearing a way through galleries closed up with earth, of which fell in from above almost as fast as it was removed; hazards arising from the difficulty of damming up streams of water which broke in upon them, and from the foulness of air and consequent difficulty of breathing and preserving light in the lower chambers; all these and many other perils have been overcome by the honourable perseverance of M. Perret, and he has returned to France with a collection of drawings which extend to 360 sheets in large folio, of which 154 sheets contain representations of frescoes, 53 of monuments, 23 of paintings on glass (medallions inserted in the walls, and at the bottoms of vases) containing 86 subjects, 41 drawings of lamps, vases, rings, and instruments of martyrdom to the number of more than 100 subjects, and, finally, 90 contain copies of more than 300 sepulchral inscriptions. Of the 154 drawings of frescoes two-thirds are inedited, and a considerable number have only lately been discovered. Amongst the latter, are the paintings on the celebrated wells of Platonia, said to have been the place of interment, for a certain period, of St. Peter and St. Paul. This spot was ornamented with frescoes by order of Pope Damascus, about A.D. 365, and has ever since remained closed up. Upon opening the empty tomb, by permission of the Roman Government, M. Perret discovered fresco paintings representing the Saviour and the Apostles, and two coffins (*tombeaux*) of Parian marble.

On the return of M. Perret to France, the Minister of the Interior (M. Léon Faucher) entered into treaty with him for the acquisition of his collection for the nation. The purchase has been arranged, and the necessary amount, upwards of £7300 obtained by a special vote of the National Assembly. The drawings will be published by the French Government in a style commensurate with their high importance, both as works of art and as invaluable monuments of Christian antiquity.

M. Léon Faucher has also obtained grants from the Assembly for the resumption of excavations at Nineveh; the renewed excavations to be directed by M. Place, the successor of M. Botta as French Consul at Mossul: also for fitting out a scientific expedition to be despatched into Assyria to complete the discoveries recently made in that part of the world; and for clearing out a temple o Serapis discovered in the environs of Memphis by M. Mariette, and conveying to Paris the statues and works of art which it contains.

PECUNIARY PLETHORA OF DULWICH COLLEGE.—It is not generally known that the "College of God's Gift in Dulwich," founded by Edward Alleyn, in the reign of Queen Elizabeth, receives annually three poor boys from each of the parishes of St. Saviour, Southwark; St Giles, Camberwell; St. Botolph, Bishopsgate; and St. Luke, Old-street. The income of the charity at first not more than £80 per annum—now amounts to between £9000 and £6000; but no corresponding extension has been made in its benefits. The matter was brought before the parishioners of St. Saviour's, at their annual vestry, on Monday evening, when Mr. Embleton stated that the parishioners had appealed to the Archbishop of Canterbury, as the visitor of the college, for the remedy of the abuses of which they complained; but the judgment which his Grace had recently given left the matter pretty much where it was, with the exception of some alterations in the mode of electing the boys to the scholarships. He, therefore, moved the confirmation of a previous resolution, authorising an application to Parliament in the ensuing session for an act to increase the number of inmates, and to extend the benefits of the college. Mr. Thwaites asked if any estimates had been made of the probable expense of obtaining an act, in the event of their being opposed by the Church interest in the House of Lords? Mr. Embleton said he was not prepared with any estimate; indeed, it would be impossible to form one until they knew whether they were to be opposed; but he had no doubt of success. Mr. Horsley was convinced the greatest abuses existed in the management of Dulwich College. A man was paid something like £1600 a year for educating 120 boys. A few years ago he had got a boy admitted, who received into the house at nine years of age, and when near 13 he wrote a letter to his mother which was full of false orthography. The abuses existing in the institution were notorious to all; and he was certain that if they once went to Parliament, people saw the disgraceful state of the charity, that no one would dare to oppose them. Mr. Bailey observed that the recent decision of the Archbishop of Canterbury went to keep the selection of boys as close as it had been for the last 300 or 300 years. Mr. Embleton expressed a confident hope that the other parishes would assist in this benevolent object. Mr. Mayland (the chairman of the meeting) said that, looking at the flagrant nature of the abuses, he had no doubt the other parishes would co-operate. Under the present management £6000 a year was divided amongst 30 persons, a thing which the donor had never contemplated. The resolution was unanimously agreed to, and a committee was appointed to carry it out.

EPITOME OF NEWS.—FOREIGN AND DOMESTIC.

The Russians have discovered four important veins of silver ore in the Caucasus—one in the delta of Sedon, another in that of Ordona, a third in that of Kosar, and the fourth near Pallitka. The ores are rich in the yield of silver. The working of them has already been commenced by order of the Emperor.

Her Majesty the Queen has been graciously pleased to give a donation of £25 for the benefit of the funds of a school erected in connexion with the Aberdeen Ragged Kirk.

In consequence of the great influx of visitors to Northumberland House, a rule has been adopted of granting tickets of admission to those persons only who shall previously leave a printed card, and not a written one, as heretofore, with the name and address of the applicant.

On the 15th of September there arrived in New York no fewer than 3890 emigrants, of whom 2562 were from Liverpool.

Six missionaries of whom two are French, two Belgians, two Dutch, and the sixth an Englishman, have left Paris for Havre, where they will embark for Oregon. They are to precede Monsigner de Mars, Bishop of Vancouver, who is about to reach the Gospel in Oceania.

The Lord Warden at Dover presided by the South-Eastern Railway Company for the examination of baggage were in Tuesday taken possession of by a staff of officers of Customs, and from henceforth the luggage of passengers will be conveyed direct to the railway station, and a saving both of time and expense effected. The accommodation has been afforded by the railway authorities, with the sanction of the Board of Customs.

The *Hereford Times* says:—"The 'great fact,' for a fact it is, that the Bishop of Winchester, with an income of £15 000 a year, according to the most recorded evidence, educates but 70 boys, is startling enough; and it becomes more startling when it is known that his predecessors have for the last half century, acted at Wickham College as a pat to an expense of half a dozen men each."

On Tuesday evening, at seven o'clock, Mr Larkman, one of the chief clerks at the parcel office of the Waterloo Railway terminus, suddenly fell forward upon a desk, and was taken up dead.

A very curious halo is token or mark was lately found in the Mediterranean, off the Spanish coast. It is now in the possession of C. Rose Smith, Esq., the numismatist and antiquarian, whose researches in hour are so well known.

A letter from Constantinople, in the *Milan Gazette* of the 23d ult., announces the arrival there of several Austrian officers, who are on their way to Persia, where they are to organise military schools. They have received 200 sequins (about £200) each for their journey and their yearly salary is to be proportioned to 600 sequins, besides which they are to have a palace to themselves at Teheran, and two servants each to wait upon them.

On Friday, last week, at the Middlesex Divisional Registration Court, held at Westminster, the names of Sir John Romilly, Master of the Rolls, and Lord Cranworth were struck off the list of voters, the former for having changed his residence without giving notice to the overseers; and the latter for having sold the chambers in right of which he held his qualification.

The number of vessels which anchored in Kingstown harbour during the year 1850, steam-packets carrying the mails excepted, was 1740, tonnage 211,560. In 1849, 3100 ships, tonnage 237,979. The new packet quay on the one mile of the Treasury and Admiralty will be commenced as soon as the traders' wharf is completed.

The ships bound for Sydney, in New South Wales, the nearest port to the Ophir gold regions, are remarkably on the increase. The General Post-office advertised on saturday nearly 20 vessels by which letter-bags would be sent to Sydney.

Lord Campbell, Lord Abinger, and Colonel Vandeleur have arrived in Galway. Lord Campbell is visiting the estate which he bought for £30,000, though he lent £60.000 on it to the late Mr. Lynch.

Twelve Tuscan artisans, who have been appointed to visit the London Exhibition at the public expense, left Leghorn on the 17th ult., on board the *Infanta*, a French mail packet, and under the direction of the engineer Sig. Angelo Vegni.

As the day of struggle (the Presidental election) in France approaches—as the horizon darkens, we see (says the *Jersey Chronicle*) several rich French families arrive in Jersey, come hither to reside to escape the storm which is about to burst forth. Several handsome houses have already been hired and furnished by families of the class, and it is more than probable that before the decisive moment we shall have amongst us many others of the like description.

Early on Monday morning four fires occurred in various parts of the metropolis, but in no case was the damage of very serious character.

In consequence of the number of persons who are still desirous of visiting the British Museum, it is announced, that it will continue to remain open to the public until the 10th inst., (Saturday excepted), when it will finally close till the 20th inst. The hours of admission will be from ten to four, as heretofore.

On Monday, operations to drain the town of Watford, and to make further improvements, were commenced. In Watford, as well as in other towns, local boards of health have been formed within the last few days, under recent acts of Parliament passed on the late session

The powder-mills of Darbiana, situate close to the road between Eidsmur and Copenhagen, Denmark, blew up on the 20th ult., causing the death of 22 workmen.

An arrival has taken place of a parcel of ten bales of hops from Rotterdam, the growth of Holland, and consigned to an eminent brewer in the metropolis, which is, we believe, the first importation that has taken place of this article of merchandise of this year's growth from any part of the Continent. Formerly pieces of the Continental hops, or small importations of a foreign collection other of the Continental states, from which, to a greater or lesser extent, supplies of this nature have taken place, the present arrival from Holland, is unique, a re introduction of the article for an eminent house of trade, is interesting.

An accident occurred on Saturday evening, at the Crystal Palace. A lady, the wife of a clergyman in Suffolk, who had been visiting the World's Show during the afternoon, on her departure was about to step into a hackney cabriolet, when the horses started off at a rapid pace, and threw the lady with great violence to the ground. On being picked up, she was found to be insensible, and to have sustained a severe fracture of the leg. The poor woman was conveyed to St George's Hospital on a stretcher.

Arrangements have been made in the Post Office, that the mails from Scotland, Ireland, and the north of England shall reach London two hours earlier than heretofore. This benefit will be obtained, moreover without any change in the time of starts, except in the case of the Scotch mail, which will leave Aberdeen seven half an hour later.

We learn from Hanover, that, in the course of a revision of the archives at Celle, a box has been found containing a collection of important documents relating to the Thirty Years War, viz. part of the private correspondence of Duke George of Brunswick-Lunebourg, with dukes of his family, and original letters from Tilly, Pappenheim, Gustavus Adolphus, and Piccolomini.

Baron Dunsandale has been elected, by a majority of the votes of the Irish Peers, to sit in Parliament as one of the 28 Representative Peers of Ireland, in the room of the Earl of Charleville, deceased.

Prince Metternich arrived at Vienna on the 23d ult., and has taken up his quarters at the Hotel de Bonnaway. He came by the railway to Brunn, where a number of distinguished persons, Prince Paul Esterhazy, count Haugwitz, &c., Count Mun, &c. Bergmuller, and other distinguished individuals, met him at the landing place. Prince Metternich, it is said, will visit the Emperor Nicholas, in person during the return of the veteran statesman to the capital of Austria, at the same time, that Prince Metternich will visit the city of Berlin.

Prince Metternich will not take any share in public affairs

A great deal of steam-ploughing has for some time past engaged the attention of Mr. Murphy of Lewisham, and he lately has succeeded in bringing to a great degree of perfection a steam plough, with which some interesting experiments have just been made in East Kent.

On Tuesday evening last, when Mr Joel Slater, butcher, of Lower Belgrave-place, Pimlico, was returning home from Richmond in a light spring-cart, accompanied by his foreman, passing Kew Bridge, one of the horses became restive, and commenced kicking, when the driver, Mr Brentnall, jumped out of the cart before Mr Slater could put a stop to it, and was thrown down and run over. Various members of the family, Prince Paul Esterhazy, Count Haugwitz,

SOUTH WALES AND GLOUCESTER AND DEAN FOREST RAILWAY.

NEWNHAM.

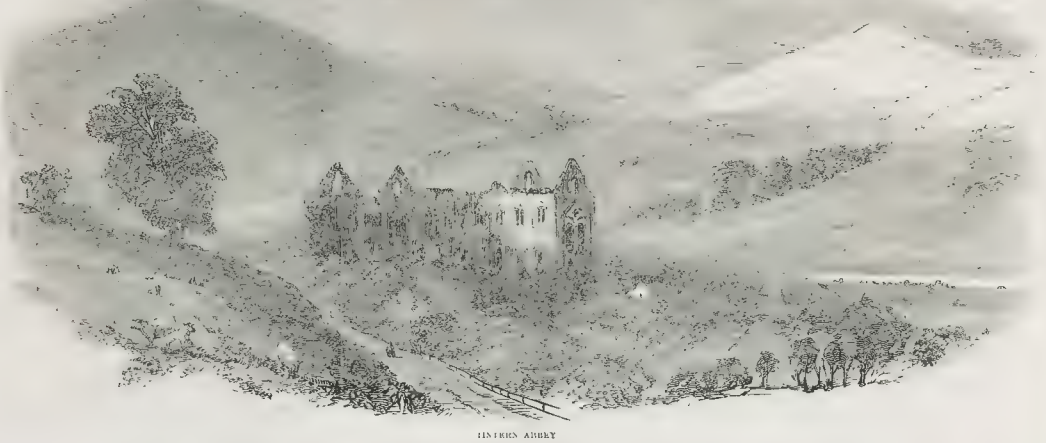
INE of railway, which promises abundant interest to tourists and lovers he picturesque, was opened on the 19th ult., on the west bank of the ern, between Gloucester and Chepstow. "It is likewise," says the *estershire Chronicle*, "an event of considerable importance to our l interests, but most especially as it supplies the connecting link een Gloucester and South Wales. We are now the central point of communication between the north and the south, the east and the west, of the kingdom; from Bristol and the neighbourhood below it, there is an uninterrupted run through our city into the farthest point of the north where the iron road has yet pierced its way; we shall now soon have the same unbroken thoroughfare across England, from Dover to Milford Haven; with the exception of the bridge which is to be thrown over the Wye, at Chepstow, the chain is complete to Swansea; and the works beyond Swansea to Carmarthen are rapidly progressing."

On the 15th ult. her Majesty's Inspector of Railways, Captain Laffan accompanied by Mr. Brunel, the engineer-in-chief, and several of the directors of the Gloucester and Dean Forest Railway Board, went over the line, and pronounced it ready for the opening on Friday. The bridge

CARDIFF.

the eastern, or Gloucester channel of the Severn, was completed on 18th ult., so as to permit of the passage of a railway carriage over it. altered time-tables were issued in the course of the week. It will en by these, that a saving of some two hours and a half, or three s, is effected by the opening on the 19th, and that the journey from ion to Swansea, by way of Gloucester, is now performed by the ex- trains in six hours and forty minutes, and by the ordinary trains in nine hours and a half. It should, however, be explained that the line is not yet completed throughout to the junction at Chepstow, but that there is a portion of it yet unfinished, arising from the difficulties which have presented themselves in the construction of the bridge over the Wye at that place. The hiatus thus occasioned is filled up by omnibuses, which meet every train and convey passengers to and from the Chepstow station.

The line was virtually opened by an ordinary passenger train, dispatched from Gloucester to Chepstow, on the morning of the 19th, at half-past nine; but the formal opening was by a special train, which left the temporary station at Gloucester some two hours later. This train consisted of about seven first-class carriages and two second-class, and was drawn by the Sampson, a powerful Great Western engine. Among those on the platform were—S. Baker, Esq., Chairman of the



TINTERN ABBEY

SOUTH WALES AND GLOUCESTER AND DEAN FOREST RAILWAY.

CHEPSTOW CASTLE.

Gloucester and Dean Forest Board of Directors; W. P. Price, Esq.; T. C. Avery, Esq.; D. M. Walker, Esq.; J. Barnett, Esq.; W. Cother, Esq., Rev. S. Lysons and Mrs. Lysons, and many county magistrates. There were 200 to 300 persons in the train, and on the engine were no less than seven gentlemen; viz. Mr. Brunel, chief engineer; Mr. Gooch, locomotive engineer; Mr. F. Clarke, superintendent of the line; Mr. W. G. Owen and Mr. Edwards, engineers; Lord Villiers, Chairman of the Vale of Neath Railway; and Mr. Matthews, Deputy Chairman of the South Wales Company.

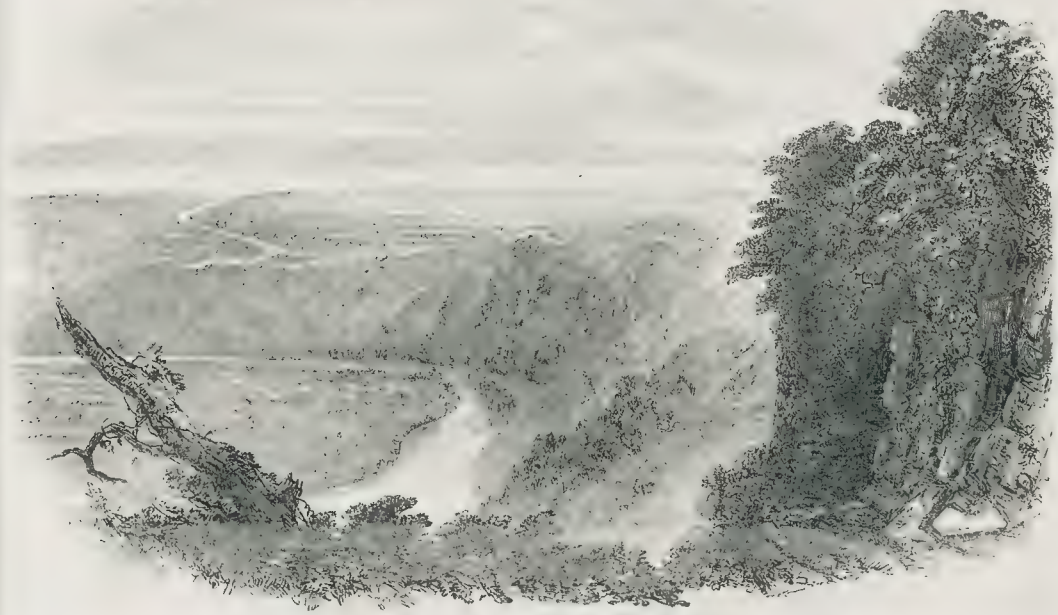
At 11.20 the train started. The long embankment and viaduct over the low meadows near the Severn were soon traversed; and the train speedily shot over the two bridges, where were assembled a considerable number of workmen, who gave a passing cheer. The beautiful spire of Highnam New Church was soon in view, and as quickly left behind; and the train sped its way amidst spreading pastures, and orchards laden with luscious fruit. The train, in about 10 minutes, stopped at the first station on the line, which is called "Oakle Street," a rural spot convenient for Churcham. The Forest Hills were soon after approached, and then a glimpse of the Severn, near Westbury, was obtained, and the train passing on through Broadoak stopped at Newnham station, which is situate in a cutting.

At Newnham the inhabitants of the place assembled to witness the arrival of the special train, and welcome the visitors. With a characteristic hospitality, the townspeople had provided for the visitors a luncheon, with fruit and wine *ad libitum*. As the trains ran into and left the station, the cheers were most hearty, and the scene altogether was a most enlivening one.

After a rest of a quarter of an hour, the train proceeded on its journey. Immediately after leaving Newnham station, a short tunnel passes underneath the East Dean road, and emerging thence, a fine reach of the Severn is presented to view. This is Bullo Pill, where the vessels in the harbour were gaily decked with colours, and a party of Foresters and workmen had assembled to cheer the train as it passed. Hagloe, Hock Crib, Purton Passage, Gatcombe Point, and Berkeley were successively seen as the train proceeded along the line close on the verge of the Severn. The line passes along the margin of the river here for several miles, and in some places the water is so near that at high t it approaches close to the railway. Wicksalme was the next o in view, and then Sharpness Point, and the junction of the Glouc and Berkeley Canal. Lydney station was reached at 12 Here inhabitants mustered on the side of the line to give their welcome to strangers, and the bells of Lydney Church sent forth merry peals Lydney the railway crosses the Severn and Wye tramway and the c passing between the wire-work and the river. Next were p Aylburton, Woollaston Grange, the residence of H. Higgins, Esq., Tidenham; and shortly afterwards the train made its last stop at Chepstow, where the passengers alighted and proceeded to the tow Chepstow in carriages, arriving there at one o'clock.

Parties of the excursionists were immediately made up to view Tin Abbey, the Wyndcliff, Chepstow Castle, and other attractions of neighbourhood, and the tourists returned to the Beaufort Arms Ho four o'clock, shortly after which hour a party of 1 ladies and ge men sat down to an elegant repast in the large room of the hotel.

The chair was taken by S. Baker, Esq., Chairman of the Glouc



THE WENDCLIFF

and Dean Forest Railway Company, who was supported on his right and left by Mr. Matthews, deputy-chairman of the South Wales Railway Company; Mr. Booker, M.P.; Sir R. Price, Bart.; Mr. Potter, director of the Great Western Company: Dr. Jenne, Rector of Pembroke and Canon of Gloucester, and Mrs. Jenne; Lord Villiers, M.P.; Mr. Brunel; Mr. Saunders, secretary; Mr. Gooch, locomotive engineer; Mr. S. Davies, M.P. for Carmarthen; J. L. Mortimer, Esq.; A. Paul, Esq.; and S. Lewis, Esq., directors of the South Wales Company;—Symonds, Esq.; Captain Bulkeley, and other directors of the Great Western Company; G. Jones, Esq., and other directors of the Gloucester and Dean Forest Company already mentioned, besides a large number of ladies.

A variety of toasts were drunk, and at the close of the entertainment the party proceeded to the East Chepstow station, and arrived at Gloucester at nine o'clock.

VIEWS ON THE LINE.

Our Artist has selected for Illustration five of the most attractive localities upon this new line of railway.

First is *Newnham*, where the excursionists were so hospitably received. Newnham stands about ten miles south-west of Gloucester, on an eminence rising from the western bank of the Severn, which is here nearly a mile broad at high water. In the Norman times, it appears to have been a fortified town, designed to repress the incursions of the Welsh. The houses are principally ranged in one long street; and the church stands on a cliff near the river.

Chepstow, 27½ miles distant by railway, is next shown; or rather it's most interesting object, the castle, sketched from the opposite bank of the Wye, with a framework of massive timber. Mr. Duffus, in his "Book of South Wales" (the best guide-book of the district), describes the Castle as a "noble and massive relic of feudalism; the boldness of its site, on a rock overhanging the river—the vastness of its proportions, render it a peculiarly impressive ruin." The entrances is a fine specimen of Norman military architecture: the chapel one of the most elegant structures ever built within a house of defence. It was originally founded almost immediately after the Conquest.

The Wyndcliff rises in the background of the view, from the road out of Chepstow to Monmouth. Having ascended the crag, "the eye," says Mr. Cliffe, "ranges over portions of nine counties, yet there seems to be no confusion in the prospect; the proportions of the landscape, which unfolds itself in regular yet not in monotonous succession, are perfect; there is nothing to offend the most exact critic in 'picturesque' scene y. The 'German Prince' who published a tour in England in 1826, and who has written the best description of the extraordinary view which Wyndcliff commands—a view superior to that from Ehrenbreitstein on the Rhine—well remarks that 'a vast group of views of distinct and opposite character here seem to blend and unite in one."

Tintern, the next scene, is thus well described by our Guide: "The fanciful Wye, filled up to its banks, and brimming over with the tide from the Severn sea, glides tranquilly past the orchards and fat glebe of 'holy Tintern.'" On every side stands an amphitheatre of rocks, nodding with hazle, and ash, and birch, and yew, and thrusting out from the tangled underwood high pointed crags, as it were for ages the silent witnesses of that ancient Abbaye and its fortunes; but removed at just such a distance as to leave a fair plain in the bend of the river, for one of the most rare and magnificent structures in the whole range of ecclesiastical architecture. As you descend the road from Chepstow, the lofty ornate creeping out of the bare, sightless windows: the wild flowers and mosses cluster upon the mullions and deipstones, as if they were seeking to fill up the unglazed void with nature's own colours. The door is opened—how beautiful the long and slender nave—what a sweep of graceful arches—how noble the proportions, the breadth, the length, and the height."

Cardiff is partly shown in the remaining scene with its celebrated Castle, which stands on the line of the Roman coast road through South Wales. The restoration of a portion of the Castle was commenced in 1847; the octagonal keep stands on an eminence within the old ramparts, which have been planted, and form an agreeable walk. On the west of the Castle is a modern castellated mansion, the residence of Lord James Stuart. The tower of St. John's Church, shown in the View, is the finest in Wales, except Wrexham, in Denbighshire, and reminds one of the Somersetsh're.

COUNTRY NEWS.

MUNIFICENT ACT.—An interesting addition to the numerous charitable establishments which form so creditable a feature of this country is about being made, through the munificence of a private gentleman, Mr. Charles Gilpin, of Stansted, Sussex, who has created a fund of £20,000, invested in the public stocks, for the purpose of establishing and endowing a college for six decayed merchants of the city of London, having no resources of their own, or an income not exceeding £30 a year, being widowers or bachelors of good character, and Protestants, about 60 years of age. A handsome edifice is now in course of erection at Rowland's Castle, Hampshire, to be called Stansted College, and is expected to be ready for habitation early in the ensuing spring. By the regulations laid down by the founder, the inmates are to receive each £40 yearly, with a month's allowance of £6 towards the expenses of a common table and cook. Provision has also been made for the remuneration of a chaplain, medical officer, and servants, and certain trustees, whose names the £20,000 has been invested, have been appointed to carry out the objects of the institution.

BRADFORD ELECTION.—Mr. H. W. Wickham (Conservative) has declined contesting the borough of Bradford at the approaching election. At present the contest (if contest there be) will lie between Mr. R. Milligan, a resident gentleman of the place, and Mr. W. Reynolds. The latter was the choice of a meeting of liberal electors, and a requisition bearing 800 signatures. The latter is the chosen of the "democrats." A large public meeting, held in the open air last Saturday, voted for Reynolds with only one single dissentient.

REPRESENTATION OF MACCLESFIELD.—Mr. John Williams has issued the following circular:—"In anticipation of a coming general election, some of my political supporters have unanimously circulated a report that I am in negotiation to represent a county in North Wales. I take this earliest opportunity of giving this report a distinct and implicit denial. I have not, nor ever entertained, the most remote intention of relinquishing the honour of the position which you have so honourably conferred upon me, and one which, while I enjoy your undiminished confidence, I shall consider it my highest honour to retain."

REQUISITION TO THE MEMBERS FOR YARMOUTH TO RESIGN.—The reply of Mr. Rumbold to a requisition from certain electors, calling upon him to resign his seat, has been published. The reason urged by the requisitionists for such resignation, "is the very determined support given by the members to the application of the Public Health Act to Great Yarmouth. In valency attendance of Mr. Whitty?—Judge: Do you want to know that the answer to this, Mr. Rumbold sent the following exceedingly spirited reply:—"Mr Rumbold has received from Mr. Harrison a requisition, signed by many of the electors in Great Yarmouth, calling upon him to resign his seat in Parliament for that borough. Mr. Rumbold feels that no observation on this proposal is required from him, and therefore simply declines complying with it." Mr. Sandars has sent no answer.

THE STORMS OF LAST WEEK.—There was a very heavy storm at sea all along the coast of Yorkshire, by Stockton, Middlesborough, Redcar, &c., last week, commencing in the after part of that day, and continuing throughout the night and the whole of Friday. There were several wrecks and some loss of life. At some points the "oldest inhabitants" had "not the wind blow with such horrid fierceness. St. George's Channel and the Lancashire coast furnish a list of casualties during the storm. As the *Iron Duke* steamer, with the Irish mails on board, was proceeding to Liverpool, the mizzen mast of a schooner were seen in the water off Bardsea Bank, with two poor fellows upon them. Notwithstanding the heavy sea which was running, the captain of the *Iron Duke* went as near the wreck as possible, and then launched a boat. One of the men was got off, who proved to be the master, and the vessel turned out to be the *Eliza*, of Preston. The other man died before the boat could reach him. They had been 17 hours on the mast, and the remainder of the crew had perished.

FORGED BANK NOTES.—On Saturday, information was circulated with the description of several persons who are travelling about the country uttering forged bank notes. At Dorking, in Surrey, on Saturday last, a man about thirty years of age, five feet nine inches high, of fair complexion, with brown hair, and an appearance of ill health, passed a forged £5 note to a tradesman, and the next morning left that place for Reigate. He was dressed in black, and carried a dark brown over-coat. At Portsmouth, a forged £5 note, No. 60 465, dated London, 14th July, 1851, payable to "Mr. Matthew Marshall," was uttered to Mr. Buchanan, by a man elder in appearance than the one above described, five feet six inches high, dressed in a dark brown over-coat, light brown trousers, and blue check waistcoat.

THE QUEEN'S COLLEGE, BIRMINGHAM.—We learn that the Queen has been graciously pleased to grant to the Institution a full-length portrait of her Majesty, to be placed in the New College Hall. A public meeting has been called for Monday next, to acknowledge, in suitable terms, this especial mark of Royal favour.

MIDNIGHT TRAINS TO THE EXHIBITION.—The Midland Company propose running midnight trains until the close of the Great Exhibition, giving short day trips, and fifteen hours in London.

WORCESTER AND HEREFORD RAILWAY.—At a meeting of the inhabitants of Great Malvern, just he d, it was resolved to support the line, provided all necessary accommodation was accorded to the inhabitants by the promoters.

The herring fishing having now ceased, the fishermen on the Scottish coast have begun to prosecute the white fishing. Since their commencement, the takes have been abundant, good prices having also been obtained for them. The salmon fishing still continues in that unproductive state which we noticed some time ago; indeed, the present has been decared to be the worst season ever experienced.

On Tuesday night, as the last train was proceeding from Chester to Shrewsbury, some scoundrel threw a stone at it with such violence that a first-class carriage was broken, and the passengers (particularly Mr Richards, the judge of the north-east Wales district county courts) placed in great danger. The extreme penalty attached to the offence is two years imprisonment and hard labour.

THE JUDGE OF THE LIVERPOOL COUNTY COURT AND THE PRESS.

A ferment of surprise and indignation has been created at Liverpool this week by proceedings in the County Court there. Mr. Ramshay, the Judge of that Court, whose conduct was a short time back the subject of an official inquiry by the Chancellor of the Duchy of Lancaster, the Earl of Carlisle, has shown by his actions and doings in his judicial capacity, and has, in particular, taken great offence at the editorial remarks of the *Liverpool Journal*, the proprietor and editor of which is Mr. Whitty, formerly chief of the Liverpool police. On Satu day morning last, a placard, announcing the publication of the *Journal*, and the nature of its contents, and containing a line in large characters in the vicinity of the Court-House, and on Mr. Ramshay's arrival at the Court, he immediately despa ched a bailiff to take into custody the editor of the *Journal*, by whose direction this placard, announcing the publication of the *Journal*, by whose direction this placard, announcing the publication of the *Journal*, by whose direction this placard, announcing the publication

MUSIC.

SACRED HARMONIC SOCIETY.

On the 30th of September, at Exeter Hall, with Mendelssohn's "Elijah," conducted by Costa, the choir vocalists being Madame Clara Novello, Misses Dolby, Williams, and Eliza Birch; Messrs. Sims Reeves and Whitehouse, and Herr Formes, was terminated the nineteenth season of the Sacred Harmonic Society, one of the most triumphant and most prosperous seasons since its formation. The magnificent performance of the sublime oratorio was received by an enormous assemblage with evident appreciation of its manifold beauties and of its masterly interpretation, and the enthusiastic cheers bestowed on the conductor at the close of the work proved the high estimation in which his exertions are regarded.

The campaign began on Friday, Nov. 29th: there have been 11 performances in all, of which eleven were subscription evenings; Handel's "Messiah" has been performed nine times, "Saul," once; "Samson," three times; and "Israel in Egypt," twice, Mendelssohn's "Paul" has been given once; the "Elijah" ten times; and Haydn's "Creation" six times.

The effect of the Great Exhibition on the receipts this year was proved by the weekly performances of oratorios since the opening, May 1, on which the exception of one Friday (August 8), there was no cessation up to September 26th. The season, in ordinary times, was generally over in May. This extraordinary activity of the Sacred Harmonists was celebrated by an interesting festival, at Brabazonville Gardens, on the 30th of July, in imitation of the Rhine Music Gatherings.

The principal vocalists who have sung this season are, Mdme. Clara Novello, Miss Catherine Hayes, Miss Louisa Pyne, Miss Birch, and Miss Eliza Pyne (Soprani); Miss Dolby, Miss M. Williams, and Mdme. Macfarren (Contralti); Messrs. Sims Reeves, Benson, Manvers, T. Williams, and Lockey (Tenors); Mr. Leigh Murray, Mr. Weiss, Mr. Whitehouse, Jr., Mr. Novello, Lawler, Herr Stockhausen, and Herr Formes (Bassos). Miss Catherine Hayes, who first appeared at these concerts in 1850, greatly advanced her fame as a singer in the sacred school. The return of Mdme. Clara Novello, after an absence of several years, was quite an event; and being in the full possession of her great powers, her singing in the majestic oratorios of Handel, Haydn, and Mendelssohn created a powerful sensation. Mr Louisa Pyne's first appearance at Exeter Hall was another interesting incident. The Misses Birch, and Misses Dolby and Williams, and the English tenors and basses, fully maintained their reputation. In noticing the marked improvement in the choir, the Musical Examiner says, that he has perceived in the acts, the light, and colouring committee to turn attention, as we have often suggested, to the production of revivals and novelties—a vast field being yet open for works of the former class; and if this inducement be not as tempting for the latter category, namely, the composition of composers to write original oratorios expressly for the Society, it is quite clear nothing can be expected from total inactivity. There are native and foreign masses of merit, which might be partly safely resorted to for cantatas, and then, perhaps, we may eventually obtain a new oratorio.

MISS CATHERINE HAYES.

The United States Mail-ship *Pacific*, Captain Nye, arrived at New York, on Sunday the 14th of Sept.; at 8 A.M., in ten days and 17½ hours from Liverpool, having had a succession of westerly winds during the passage. There were 192 passengers on board, including Miss Catherine Hayes, accompanied by her mother and sister, Miss Laura Hayes, the tragedian, Mr. Augustus Braham, Mr. Lavenu, Herr Meuris, Dr. Joy, &c.

The *New York Herald* describes the reception of Miss Hayes on her landing at New York, to have been of the most enthusiastic description. On the 18th, Miss Hayes was present at the opera; after which she was serenaded at her hotel, Astor House, by the members of the New York Musical Fund Society.

MR. W. GLOVER'S NEW ORATORIO. "EMMANUEL."—This work was performed at the Free-Trade Hall, Manchester, on the 20th ult. Amongst the audience were a large number of the resident clergy and gentry, and about 1,500 of the leading professors and amateurs, altogether amounting to 1500 persons, who warmly applauded the production of their clever fellow-citizen. The band was led by Mr. Seymour, and Mr. W. Barlow was the organist. The principals were all of the Manchester school. The chorus amounted to about fifty voices, and maintained their deserved fame, although the number was not in proportion to that of the band.

THE LONDON GLEE AND MADRIGAL UNION.—Mrs. Endersohn, Miss Williams, Messrs. Francis, Land, Lockey, and Phillips, gave concerts on Tuesday and Wednesday, at Brighton; on Thursday, at Hastings; and last night, at Tunbridge Wells.

THE THEATRES.

HER MAJESTY'S.

Madame Barbieri Nini made her final appearance this season on Wednesday night, in the character of *Lucrezia Borgia*. On the 14th this distinguished artiste will commence the campaign at the Théâtre des Italiens, in Paris. It was then announced that on the management here that she did not make her *début* in this country before the 5th of August, leaving so little time for the real operatic public to become acquainted with her magnificent style. Her rounds of parts included by the day of her final appearance, having been confined to eight performances of "Lucrezia" (the entire work), and to five nights in acts of that opera, once in "Anna Bolena," and, owing to the indisposition of Mademoiselle Cruvelli, in the first act of the scene eleven times three times in "Lucia," and thrice in portions thereof. Notwithstanding the disadvantageous circumstances under which Madame Barbieri-Nini has been thus presented, she has completely confirmed, in the fullest opinions we have formed, the high reputation she had acquired in Italy. Whether she came early or late in an evening's programme; whether the situation of the "reaction" in which she saw herself placed during the real opera could excite her hearers in the most intense degree. With a rare and figure almost painfully regulate, the vocal and histrionic attainments of this truly eminent artiste, I have regularly triumphed, because she is emphatically an *artiste*, a designation constantly applied, but the conditions of which are rarely fulfilled. Madame Barbieri-Nini's voice has undoubtedly passed its meridian, but her organ is still of surprising power, richness, and brilliancy; she has at her command the most extensive range of beautiful notes, over which she has a perfect command, so as to depict the varying shades of feeling, sentiment, and passion. Her method is for the highest order of refinement, precision, and delicacy; while she has the dramatic impulse and intensity to rouse her listeners to the highest pitch of enthusiasm.

Mdme. Barbieri-Nini's *Luer na Borgia*, as on all former occasions, quite took the house by storm, from her first delivery of the opening recitative, so full of meaning and intelligence, and her *aria d'entrata*, so replete with fire and brilliancy, to her concluding scene, in the "Madi, sh m'odi" in which she was as irresistible as ever, and her vocalisation in the cabaletta at the close electrified the amateurs by the wonderful division she executes with such consummate ease and finish. There was no end to the encores throughout the opera to this incomparable singer, whose return will be welcomed next season with the most sincere delight by the musical public.

"Norma" was given on Thursday night; "Il Barbiere" was announced for last night; and that "Somnambula" will be repeated this evening (Saturday). Next week will, or rather must, positively terminate this protracted season, as the engagement of the principal artistes, both male and female, for the opening of the Italian Opera-house in Paris, will call the company in London. Mdlle. Cruvelli and Mdme. Frezzolini are now the resounding *prime donne* up to the close of the Exhibition.

SADLER'S WELLS.

Morton's comedy of "Secrets Worth Knowing" was played on Friday week, very effectively, and told well, though the theme is *outré* to modern times. Mr. Hoskins, in *Redtress*, the country gentleman, and Mr. Phelps, in *Sir Harry Darrell*, the old actors; while Mr. Ray, as *Un derune*, proved that comic art is not yet lost to the stage; and Mrs Marston, in *Sally Dunwright*, that Mrs. Glover has on is worthy successor. It carries here to be noted, that the revival of "Timon of Athens" has met with remarkable success—and this, we believe, notwithstanding some opinions to the contrary, as much from the power of its poetry as the excellence of its scenery. We have witnessed the performance a second time, and with increased pleasure; the and once also appeared to take a decided and even strong interest in the beauties of the dialogue, the force of the situations, and the development of the character. The acting principal, as we have said, cannot be adequately represented by any living performer; but Mr. Phelps has thrown himself into it with considerable earnestness and sincerity. We think him occasionally too violent, but vigorous conceptions are evidenced in character-reading and the result of careful and patient study. Where these are present, we easily compound for the absence of qualities, the want of which, however, is noted rather from its difficulty of the part than any fault in the performer.

LYCEUM.

A new three act comedy, called the "Game of Speculation," was produced on Thursday, under the benefit of Mr. Charles Mathews. The piece is one rather of character than plot. *Mr. Affable Hawk* (Mr. Charles Mathews) is the speculator on 'Change; and the situations of the drama exhibit him in all the perplexities, hopes, and fears, that pertain to his peculiar calling. The next part of importance is that of *Sir Harry Lester* (Mr. Robert Roxby), who seeks to raise money on Irish bonds and an Irish railroad, *alias* the sea-shore, and nearly victimises the self-styled "Napoleon of Finance." *Hawk*, however, finds that he has a day to recover himself in, during which, as he says, "The world turns round," and, sure enough, good luck turns up for him, even conveying him from a debtor to a creditor—a position in which he enjoys a peculiar triumph. We understand that the business has been so prosperous lately at this house, that an extra week's salary was presented last Saturday to the company, by way of acknowledgment of the extra success experienced.

ADELPHI.

"Bloomerism; or, the Follies of a Day," is a new farce, produced here on Thursday. It is written by Mr J. H. Nightingale and Mr. Charles Millward, of Liverpool. The main theme of the piece is obvious; but the writers have taken an extended view of their subject, and included vegetarianism, phonography, and other nuisances of minor moment, in the scope of their satire. Miss Woolgar (Mrs Gregor as *Mrs. Green*, the advocate of the rights of woman, and exemplar to her friends of Bloomerism, acted with great spirit.

NATIONAL SPORTS.

The autumnal meetings will be more than usually numerous this year; and, as at present they stand, will extend the season unto the third week of November—too late, by at least a fortnight to be either attractive to the public or profitable to the speculator. The principal meeting this week will be—the Chester, two days; Wrexham and Brighton, on Thursday, each occupying two days. Chester promises to maintain its reputation for excellence, variety, and quantity. There will also be meetings at Hamilton, on Monday; at Hampton, on Tuesday; at York (the Union Hunt), on Thursday and Friday; and at Perth, on Friday.

Sailing, rowing, and cricketing have gone the length of their tether; and the coursing and steeple-chase calendars contain nothing before the middle of the month.

TATTERSALL'S.

MONDAY.—The scratching of Newminster; a decline in Mokanna, Trickatrees, and Condience, and an improvement in Grand Duke and Hippolytus, were the main features of the betting, this afternoon, on the Cesarewitch. The Cambridgeshire transactions were noticeable only for the elevation of Newminster to the premiership. Business generally was very dull.

CESAREWITCH.			
11 to 1 agst Mokanna (t)	100 to 6 agst Hippolytus (t)	40 to 1 agst Hesse Homburg	
11 to 1 ——— Grand Duke	25 to 1 ——— Darkin	50 to 1 ——— Hasimada (t)

SWEEPSTAKES. Bird-on-the-Wing walked over.

THE HAT STAKES were won by Jack Robinson, beating Dr. Blemish easy.

THE HUNTERS' STAKES were won by Gregson's horse.

REGATTA AT WOOLWICH.—On Monday a contest took place for a new boat, and other prizes, presented by Mrs. Alderman Salomons to the watermen there. The contest was for pair-oared rowing in five boats. The interesting proceedings were of a very animated character, the donor and friends being present to witness the sport, together with a vast assemblage of spectators on the river and shore. The final heat was won by John Pamplin (green).

GRASMERE, WESTMORELAND.—(*From a Correspondent.*)—The first snow of the season fell here on Thursday, the 25th ult., and the hill-tops retain red some of it on the 29th.

FEMALE CONVICTS.—The *Anna Maria*, female convict ship, in charge of Surgeon Superintendent M'Crea, at present lying off the Royal Arsenal, Woolwich, has late week taken on board about 200 female convicts, several of whom have their children with them, for conveyance to Robert Town.

BELGIAN HOPS.—An arrival of ten bales of hops took place on Monday, by the steamer *Panther*, from Ostend, consigned to order, the growth and produce of Belgium.

Cardinal Wiseman has just been elected a member of the Royal Historical Academy of Spain, a distinction seldom conferred on English *literati*. The late Earl of Munster and Mr. Southey, however, were members; but it is, perhaps, more curious in a literary point of view, that no Cardinal is one of the first members of the Academy, which numbers many members of our Royal Society of Literature, having been elected more than twenty years ago, on account of the talent displayed in his writings (not of a religious nature), and that he was proposed for that honour by the late most pious and orthodox Bishop Burgess, and St. David's, and thence of Salisbury.

ASSYRIAN DISCOVERIES.—We are glad to hear that the Lords of the Treasury have at length consented to advance to Colonel Rawlinson the sum of £3,500, to enable him to continue his explorations and exhumations in Assyria. We may doubt if this step would have been even this tardily taken, but that the value of the discoveries has been so recently exemplified by Colonel Rawlinson, in relation to the history of Hezekiah and Sennacherib. The grant, too, is small, compared with the sums and means devoted to a similar purpose, by the Government of the French Government; it is only very recently that in the same country, by the French Government; it is only very recently that a new expedition of several ships, with abundant appliances, set sail from one of the French ports. Colonel Rawlinson is to proceed immediately to Bagdad, where he is the resident of the East India Company, and from thence he can go to the ruined mounds of Nineveh, and there search for fresh treasures. Let us hope that the time for the opening by the late most pious and orthodox Bishop Burgess, and St. David's, and thence of Salisbury.

ASSYRIAN DISCOVERIES.—We are glad to hear that the Lords of the Treasury have at length consented to advance to Colonel Rawlinson the sum of £3,500, to enable him to continue his explorations and exhumations in Assyria. We may doubt if this step would have been even this tardily taken, but that the value of the discoveries has been so recently exemplified by Colonel Rawlinson, in relation to the history of Hezekiah and Sennacherib. Colonel Rawlinson is to proceed immediately to Bagdad, where he is the resident of the East India Company, and from thence he can go to the ruined mounds of Nineveh, and there search for fresh treasures. Let us hope that the time for the opening by the late most pious and orthodox Bishop Burgess, and St. David's, and thence of Salisbury.

MONETARY TRANSACTIONS FOR THE WEEK.

(From our City Correspondent.)

An improvement in prices generally marks the week's transactions. The Consol Market on Monday opened with the improved prices of Saturday; and, though the amount of business done was comparatively small, still the Market was well supported, the closing quotations being 96⅛ for Money, and 96⅛ for Account. The operations of the Government broker and improved prices in the Funds added to the strength of the Market on Tuesday, Consols having been dealt in for Money and Time at 96⅞ 97; but a reaction, arising from realising on the advance, reduced prices on Wednesday to 96⅝ for Money and the quiet market of Thursday just supported quotations. An improvement in the foreign exchanges, the plentiful harvest, and passive appearances of political affairs abroad are the ruling causes of this improved state of feeling. Exchequer Bills remain about last quotations. Railways are now nearly confined to Consols. The other Government Stocks are closed for the dividends. At the termination of the week's business prices were—for Consols, 96⅝; India Bonds, par to 2 2000, 80 p; South Sea Stock, 108; Consols for Account, 96⅝; Exchequer Bills, Small, 46 p.

Mexican has fluctuated during the week, it being now the favourite speculative stock. Monday was the selling, and the price reached to 2½ 27. Notwithstanding advices confirming the news of the disturbed state of the country, on Tuesday it again advanced to 27⅛ ⅜, but declined on Wednesday. Spanish, as the account progressed, also advances to 21⅛ for the Five per Cents. which was firmly held until Wednesday, when 21 to ⅛ became the quotation, it since having again receded a fraction. The hope expressed, that, if Spanish finances improved, a sense of honour would induce a more favorable arrangement, has been replied to by the following curt and discourteous note.

Finance Ministry, Madrid, Sept. 29

The law of the 1st of August last having decided every thing relating to the settlement of the debt, and the sum of each and every credit to be income to enter into farther discussion on the subject, when the only thing remaining for the Government is the punctual fulfilment of the above mentioned law.

I have already signified to you, and repeat it here, in answer to your communication of the 15th instant. May God preserve you many years

(Signed) JUAN BRAVO MURILLO.

Sardinian Scrip is about last week's discount. The Market at the close of the week was steady, with a slight depression of prices, quotations being, for—Mexican, 27⅛ per Cent., ex Jan Coupons, Account, 27; Portuguese, Four per Cent., 32½; Russian Bonds, 111⅜; Spanish, Five per Cent., 1840, 21; Ditto, Passive, 5⅞; Ditto, Three per Cent., Account, 37⅛; Belgian, Four-and-a-Half per Cent., 93½; Dutch, Two-and-a-Half per Cent., 64; Guilders, 69; Ditto, Four per Cent., Certificates, 99¾ x d.

Shares have been fair during the week, the settling on Monday proving a rather mixed affair. In Great Westerns and South-Westerns the speculators had oversold themselves: a rise of £3 on each was the result. The market was better generally when the Account had terminated; but it is, at the close of the week's business, a trifle duller. Prices are for—

ORDINARY SHARES AND STOCKS.—Bristol and Exeter, 79; Caledonian, 11¾; Chester and Holyhead, 17; Eastern Counties, 6¾; Eastern Union, 5 and C, 4; East Anglian, 1¼; Edinburgh, Perth, and Dundee, 48; Great Northern, 18½; Ditto, Halves, A, 5; Ditto, Halves, B, 12½; Great Southern and Western (Ireland), 93½; Great Western, 85½; Lancaster and Carlisle, Thirds, 7½; Lancashire and Yorkshire, 65½; Leeds, Northern, 12½; London and Blackwall, 7; London, Brighton, and South Coast, 94½; London and North-Western, 117½; Ditto, Quarters, 25½; London and South-Western, 84; Manchester, Sheffield, and Lincolnshire, 37½; Midland, 47; North British, 6; North Staffordshire, 9½; Oxford, Worcester, and Wolverhampton, 18½; Scottish Central, 15¾ x d.; Shrewsbury and Birmingham, 15; Shrewsbury and Chester, 13½; Ditto, Halves, 7½; Ditto, Oswestry, 10¾; Shrewsbury and Hereford, 3½ x d. South-Eastern, 19½ x d., South Yorkshire and River Dun, 12; York, Newcastle, and Berwick, 18½; York and North Midland, 19½.

LINES LEASED AT FIXED RENTALS.—Leeds and Bradford, 100; London and Greenwich, 11⅜.

PREFERENCE SHARES.—Eastern Counties, No. 2, per Cent; Northern, Five per Cent. Redeemable, 8½; Manchester, Sheffield, and Lincolnshire, Quarters, 3½; Ditto, Fifths, 3½; Shrewsbury and Chester, 15; South Devon, 15¾.

FOREIGN.—Boulogne and Amiens, 10½; Central of France, 17; East Indian, (£18 paid), 20½; Luxembourg (£3 paid), 4½; Northern of France, 14½; Paris and Rouen, 11; Rouen and Havre, 9½; West Flanders, 2.

THE MARKETS.

CORN EXCHANGE.—A fair average time-of-year supply of English wheat has been received per 70 coaches this week, sometime and by land carriage, in excellent condition. For most kinds the demand has ruled steady, at stationary prices. Fine foreign wheats have been held at full prices. Barley and the various kinds of beans and maidling peas have been almost nominal. Malting barley has moved off slowly, as previous rates: but grinding and distilling sorts must be considered 1s per quarter lower. No change in malt, but oats have barely supported last week's currency. The flours have given way 2s per quarter. Peas, Indian corn, and flour have ruled about stationary, the nominal quotations of the latter being, for—London, 22s to 23s; Suffolk, 20s to 22s; Essex and Kent, 21s to 23s; ditto, white, 23s to 25s; Norfolk and Suffolk, red, 21s to 23s; ditto, white, 23s to 25s; Northern, red, 21s to 23s; ditto, white, 23s to 25s; Scotch, 21s to 23s; ditto, white, 23s to 25s. Rye, 13s to 14s. Grinding barley, 15s to 16s; distilling ditto, 17s to 18s; malting ditto, 20s to 21s; Norfolk and Suffolk, brown ditto, 44s to 45s; Kingston and Ware, 50s to 54s; Chevalier, 50s to 56s; Lincolnshire and Yorkshire, 44s to 46s; Scotch, 42s to 45s; peas, white, 38s to 40s; Kingston and Ware, 42s to 44s; ditto, white, 42s to 44s; boilers, 40s to 42s per quarter. Town-made flour, 40s to 42s per sack. Stockton and Yorkshire, 32s to 34s per 280 lbs. Oats, 20s to 22s; ditto, 24s to 26s; barley, —s to —s; ditto, —s to —s; Foreign Danzig red wheat, —s to —s; ditto, —s to —s; white, —s to —s; ditto, —s to —s; peas, —s to —s per quarter. Flour, American, 18s to 22s per barrel, Canada, 6s to 6s per barrel, French, 21s to 23s per sack.

Liverpool Market.—Raw cotton is coming heavily to hand, yet the demand is steady, at full prices. Tares dull, and the turn lower. Linseed and rapeseed are quite as cheap as last week.

Linseed, English, sowing, 60s to 65s; Baltic, crushing, 44s to 47s; Mediterranean and Odessa, 42s to 44s; Bombay, 40s to 42s per quarter. Coriander, 9s to 10s per cwt. Brown mustard-seed, 7s to 8s, white ditto, 6s to 7s, and tares, 3s 6d to 4s 6d per bushel. English rapeseed, —s to —s. Foreign, —s to —s; extra, —s; white, —s to —s, extra, —s per cwt.

Bristol.—The prices of wheat on the bread in the metropolis are from 6d to 6½d; of household ditto, 4½d to 5½d per 4 lb loaf.

Bury.—Wheat, 36s to 40s per qr.—Wheat, 36s 7d, barley, 22s 11d, oats, 19s 9d, rye, 25s 4d; beans, 24s 9d; peas, 27s 6d

Hay and Straw.—Wheat, 38s 5d, barley, 22s 11d, oats, 19s 9d, rye, 25s 4d; beans, 24s 9d; peas, 28s 6d.

Dukes.—Wheat, 1s; barley, 1s; oats, 1s; rye, 1s, beans, 1s; peas, 1s.

York.—The market is still heavily supplied with all kinds, for which the demand is in a sluggish state, at last week's prices. Common sound oats may be had at 9d per 7 lb.

Skipton.—Large quantities brought to the hammer this week have been comparatively small, nevertheless, the amount of business doing is small, and in some instances a concession was given to buy lower. Good fine yellow Barley seldom has changed hands under 30s to 40s; middling, 25s to 28s; fair yellow, 20s 6d to 23s 6d; good middling and good Maidulus, 24s 6d to 26s 6d; and whole and thin, 22s to 24s per cwt. Rather a short supply of oats, and a large one a dull sale, at 2s per cwt for brown lumps.

Chester.—All present kinds move off slowly, at barely last week's prices. Good ordinary Barley, 30s per quarter.

Ludlow.—Our market is inactive, and the turn lower. New P Y C, on the spot, is selling at 40s to 42s 3d, and old, 38s 6d per cwt. Town tallow, 36s to 38s 1d per cwt, net cash; rough fat 2s 2d per 8 lb. There are now 14,000 casks on passage from the Mediterranean, and 2,000 from the Black Sea ports, which is very dull to sell, at from 21 to 24 to 24 to 25 per cwt. Cod is selling at £37; pale seal, £35; sperm, £82 to £84; southern, £31 to £33 per ton.

Newcastle.—Coal trade remains in dull in sale, at the late decline; viz. 9s 6d to 10s 3d per gallon best. Lewards, is 4d to 1s per chaldron. Jamaica is the turn lower. Brandy is to good demand, with a firm market. British spirits, 2s 6d to 2s 9d per gallon. Gin, 2s 7d to 2s 9d per gallon.

Hay and Straw.—Meadow hay, £3 10s to £5 17s; clover ditto, £3 3s to £4 14s; straw, £1 1s to £1 6s per load. A dull trade.

Hops.—Large supplies of new hops are coming forward.

Wool.—The next public sale of Colonial wool, at which about 40,000 bales will be offered, will commence on the 23rd inst. The Spanish wools are quite as dear; but other kinds on a slow sale.

Pontefract.—Very large supplies are still on sale. For most qualities the demand is inactive, at late rates; viz. 25s to 30s per ton.

Norwich.—Very large supplies of fat stock have been on offer this week, whilst the general trade is dull and heavy, at almost a stationary price.

Beef, from 2s 2d to 3s 6d; mutton, 2s 8d to 4s; veal, 3s 6d to 4s 6d; pork, 3s 6d to 4s 6d per 8 lbs.

Wakefield.—Beef, from 2s 2d to 3s 6d; mutton, 2s 8d to 4s; veal, 3s 6d to 4s 6d; pork, 3s 6d to 4s 6d per 8 lbs.

Leeds.—Beef, from 2s 2d to 3s 6d; mutton, 2s 8d to 4s; veal, 3s 6d to 4s 6d; pork, 3s 6d to 4s 6d per 8 lbs, by the carcase.

London: JOHN CHURCHILL, Princes-street, Soho.

Now ready,
THE CRYSTAL PALACE and its CONTENTS an Illustrated Cyclopædia of the Great Exhibition No 1 in 5 Quarto Pages, price ONE PENNY, on SATURDAY, OCTOBER 4 The Great Industrial Exhibition of 1851, now on the eve of closing is an event whose beneficial effects of which are not for our own day alone, but "for all time" That concourse of the highest practical and speculative intelligence of the various nations of the world, that vast assemblage of materials for upgrading and of manufactured goods from all quarters of the globe, must have led to a new procession of individual experience, an interchange of thought, which must add largely to the general store of knowledge, and an acknowledgment of relative commercial interests which must promote the common welfare of the whole human community. In this great mart of intelligence and wealth the pursuit of our fellows has been quickened, perhaps more largely, in proportion, than the richest in the land, for it is by the stimulus thus given to the energy and enterprise of the world that we must hope to improve our condition and rise in the scale of society. And have not the millions who have flocked to the interior and to the far land in this great industrial gathering shown that they rightly appreciated its general importance? and have not their ever-rising inquiries in various departments, such according to his calling or views, proved that they were determined to make the most of the opportunity afforded them? Yet the advantages intended to be derived through this great undertaking will mainly depend upon the record which is kept of important facts eliminated, and the valuable examples presented to observation Such a record does not exist at present, and it is with a view to supply a desideratum which no ordinary pressure of business by itself, and to perpetuate to the use of the intelligent and industrious millions all the more important facts and illustrations of the Great Exhibition under the land as well as social bearings, that THE CRYSTAL PALACE, an Illustrated Cyclopædia of the Great Exhibition is presented; and which will contain well-digested accounts of all matters of real and permanent importance in that great display, copiously illustrated with Engravings and published at a price which will place it within the reach of all readers. In order to render the work a complete record of this important event, and soon the gathering and the various sketch will be given, taking a complete review of all the
great national undertaking, from the first sketches to its
and Prince Albert's website perpetuation in 1849 down to the final closing of the doors and the adjudication of prizes in October, 1851
The whole work will be published in parts as far as practicable, which will be so arranged that they several clerks heads from time to time
[illegible]
ber On the completion of the work an index will be given, which will render it available as a complete encyclopædia of science and
Weekly, price One Penny.

GOLDEN DREAMS and WAKING REALITIES; being the Adventures of a Gold Seeker in California and the Pacific Islands By WILLIAM SHAW
"This book is most excellent: the author has a good story to tell, and he tells it in a plain vigorous manner. His 316 pages of truth have vexed no dull hours. Short enough for the hundred pages of a three volume novel."—Examiner
"Mr Shaw's perils and saw suffering such as in fiction would seem unnatural His career was one continued series of hardship, privation, and labour, with frequent danger and risk of life."—Spectator.
London: SMITH, ELDER, and CO., 65, Cornhill

WRIGHT, Pall-Mall: Leader and Cock, Hivington, Halchard, &c; and all Book and Musicsellers.

HAMILTON'S MODERN INSTRUCTIONS for the PIANOFORTE Revised by CHARLES CZERNY. 32nd edition, large music folio, 4s
"This is the twenty-second edition, and a cheaper or more useful work was never published. Valuable as it has hitherto been to preceptors and students, the present issue is an improvement even upon the former ones, and is to the utmost of its extent a Modern Instructor." Herald, now reaches the large number of five hundred copies monthly. It is complete in every point, and as it has been well arranged, that a child might become proficient by attending to its directions. The theoretical sentences with standard melodies, and gradually go on increasing in brilliancy until the most sparkling music of modern composers is accompanied without difficulty. We can say at all surprised that the work should have become so popular, considering its merits and cheapness." Vide North Wales Chronicle, April 12
London: D. COCK and Co., New Burlington-street, publishers to her Most Gracious Majesty the Queen.

THE BLOOMER POLKA.—The last new Polka, by J. J. BLOCKLEY, price 2s, with a splendid illustration of the Bloomer Costume. Also, the Bloomer Quadrille, and Bloomer Polkas of the season. NEW SONG, "I MET HER in the CRYSTAL HALL." Price 2s. Sung by Mr. Sims Reeves
"This beautiful and expressive ballad will come home to every frequenter of the Crystal Palace, and will be sung by every lover of sentiment. The words are by J. S. Carpenter one of our finest lyrical bards; and the music, by Stephen Glover, is equal to anything from his pen produced of late years. He will from the same generating a pleasing and tactic power that pens which will ensure effect.
DUFF and HODGSON, 65, Oxford-street.

Invisible and all kind of portable instruments for relief of extreme deafness. Microscopes and SOLOMONS, Opticians 29, Albemarle-street Piccadilly

MR. BROSTER, F.A.S.E., sole Discoverer of the System of RESTORING the ORGAN of SPEECH—In the year 1824 when Mr Broster was called to Scotland under the auspices of a lady of high rank (the Countess of Morton) and distinction, to whom Dr Abernethy had recommended him in cases of asthma, and numerous pupils applied to him for his assistance The cures which were then effected caused the Lancet and other medical journals to proclaim to the public the benevolent and important object of Mr Broster's labours; and as they have kept them in remembrance ever since, a few words by Mr Broster, published a notice on the subject in Blackwood's Magazine for January, 1850. Under these circumstances Mr Broster was anxious to explain the principle of his system of treatment, which he expresses his opinion of its value and advantages. Mr Broster continues his occupation at his new residence, Chester Lodge, Sandown Esplanade, Isle of Wight

DECAYED TEETH.—A NEW DISCO-VERY Patronised by her Majesty and his Royal Highness Prince Albert. MR. ASH'S WHITE ENAMEL SUCCEDANEUM for stopping Decayed Teeth, however large the cavity. IRELAND IN THE EXHIBITION.

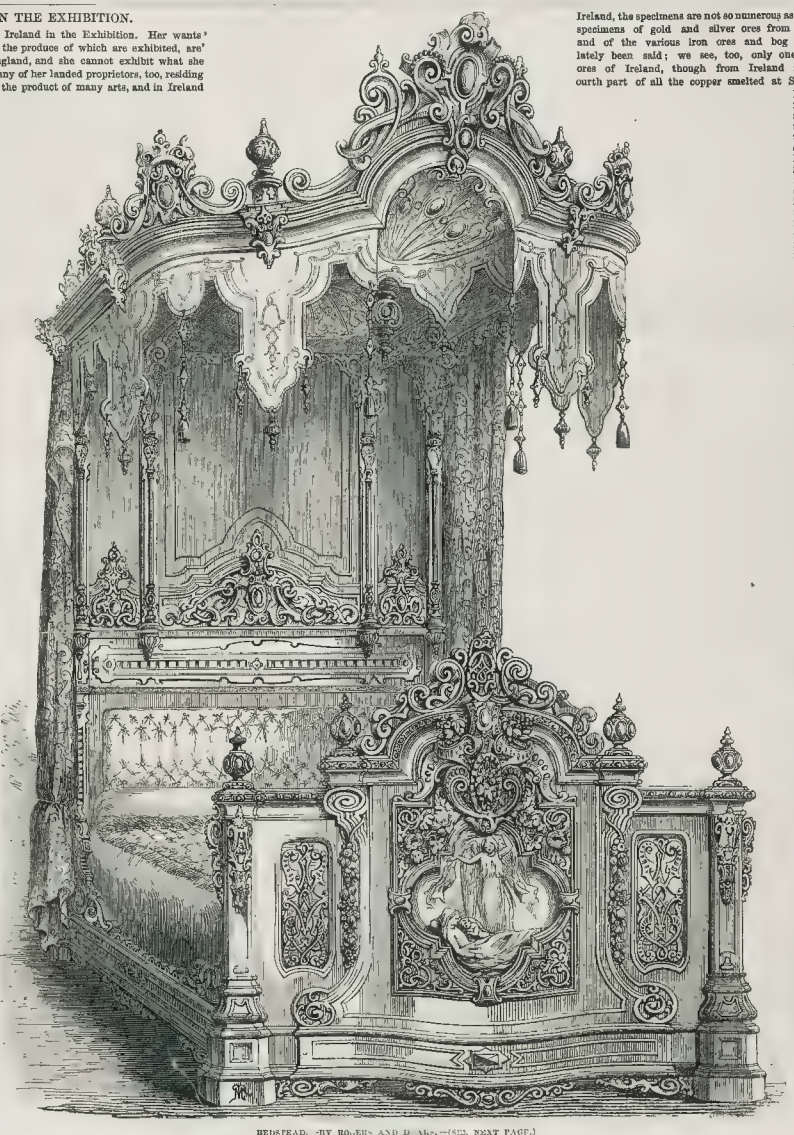
We do not expect much from Ireland in the Exhibition. Her wants so far as the arts are involved the produce of which are exhibited, are in the main, supplied from England, and she cannot exhibit what she does not produce. From so many of her landed proprietors, too, residing abroad, there is no market for the product of many arts, and in Ireland they are not called into existence. For all the talents that should be engaged in them, England is the market; and the arts in England are accordingly enriched by the genius and skill of the Irish. They must be judged by their works in England, rather than by their works at home. The natural offspring of civilisation, the growth of that luxury to which they minister, most of the arts require wealth to foster them; and where the wealth of the community is, there, and there alone, can they flourish. It is not the poor and thinly peopled parts of France, not the heathy districts of Hanover, that have contributed the most to the Exhibition, but the opulent and densely populated cities of Paris and Hamburgh. The Exhibition, in fact, consists almost exclusively of the products of city arts; a few specimens of wool, cotton, grain, timber, stone, slate, &c., are the exceptions, rather than the rule, and the grand show is emphatically the work of the town population. Ireland, unfortunately—and it is one of the many marks of the backward civilisation of her people—has a very small proportion of such population. Only four towns, Belfast, Limerick, Cork, and Dublin, contain more that 50,000 people, each, and only one, the latter, contains above 100,000. Dublin has 254,850. The whole town population of Ireland scarcely exceeds in number the inhabitants of Liverpool and Glasgow, and many of them live in what may be called rural towns of less than 10,000 inhabitants. There are, accordingly, not many objects in the Exhibition sent from Ireland which attract or deserve much attention.

The only manufactures for which she is much celebrated, the poplins of Dublin, and the linens and damasks of Belfast, belong to the textile fabrics, and have already been noticed under that head. In these she holds a high place. The next class in which she shows comparatively well illustrates her general position; it is the class of mining and mineral products, and in this she is more conspicuous for the latter than the former. The various sands and earths from the river Shannon, with some illustrations of their uses, have been industriously collected and exhibited. There are many specimens, too, of building stones, of Irish marbles, of granite, of alabaster, of porcelain clay, of common clay, and draining pipes, of turf, of anthracite coal, of slate in slabs and for roofing, of manganese and lead ores, and of lead-pipe, &c.; but, in proportion to the rich mineral treasures of Ireland, the specimens are not so numerous as we might expect. We miss specimens of gold and silver ores from the Wicklow mountains, and of the various iron ores and bog ore of which much has lately been said; we see, too, only one specimen of the copper ores of Ireland, though from Ireland is obtained more than a fourth part of all the copper smelted at Swansea. The treasures of Ireland are not yet brought fully into use; they are not all of them daily and extensively wrought, and therefore specimens of them cannot be profusely exhibited. Enough, however, is shewn to prove that neither materials for the ordinary purposes of building, nor for the finer arts—neither the ores from which man wins the most useful or the most seductive metals, nor the fuel nor the flux he must have for reducing them, neither gems nor paving stones, are wanting in Ireland. We will not borrow the poet's words, and say, that "all save the spirit of man is divine;" but we will say, that the raw materials from Ireland, as displayed in the class of mineral products, confirm the often made assertion, that nothing is required there but an enlightened and active spirit to turn her many natural endowments to the advantage of her people.

The marbles of Ireland, placed both in Class 1, Mineral Products, and in Class 27, Manufactures of Mineral Substances, make rather a good show. Amongst them is found statuary marble of a superior quality, more like that used by the Greek sculptors than any other now known. It has the peculiar tint of that marble, and resembles it in texture Lord Montcagle exhibits a bust of Grattan, worked in marble from the Dunlavey Quarries, Donegal, valuable both as a good representation of the great original, and a specimen of Ireland's natural products. We remark in it a resemblance to Sir Walter Scott. The green Connemara marbles exhibited, too, in both departments—in the form of a mere polished slab, from the D'Arcy estates in one; and in the other, as tables—in conjunction with the black marbles of Galway, and serpentine tables from Ballynahinch may fairly rival the marbles from Cornwall or Derbyshire, and, were they brought together, as we think they ought to be, would do more credit to Ireland. As a member of the empire, in fact, her products are lost amidst the more multifarious and valuable products of the whole. Had they been placed apart, like the products of Canada, they would have been thought more of, and, probably, the Irish, from a patriotic or national feeling, might have exerted themselves more to get up an Irish compartment, than merely to be lost in the general splendour.

There are several specimens, in both the classes mentioned, of slate as obtained from the quarries, and as applied to use. It is procured in Wicklow, Limerick, and the island of Valentia, Kerry. In general



BEDSTEAD, BY ROGERS AND DENBY.—(SEE NEXT PAGE.)

it is of a good quality, and is so tough that it is sawn while other slate is split. This is one of the many natural productions of Ireland which offer an abundance of resources to her people, whenever they have acquired knowledge enough to use them, and wisdom enough to live in peace, respecting each others rights in the land of their fathers. The many uses to which slate can be put are only, in fact, beginning to be known. So, gutta percha was introduced into this country as a curiosity more than a century ago, but its possible uses were only partially found out in 1843, and since then the knowledge of them has been most rapidly extended. The history of caoutchouc is similar. As India-rubber, it has been known to us for more than a century, but it is only within the last fifteen years that any conception has been conceived of the numerous uses to which it may be applied. Slate, on which boys have done their sums from time immemorial, and which has for as long a period been used in places to roof houses, is now applied to a great variety of purposes. Of it, as the most even and empty of materials, hitherto tables and hog-troughs are made. It is admirable for pickling tubs and water filters. It can be painted, and the colours burnt in like porcelain; in fact, it is potter's *biscuit* ready for the design and the kiln, so that even the commonest utensils for the commonest purposes may be cheaply made out of slate to resemble the costliest marble. A wonderful improvement has been effected in various kinds of ornaments by the use of gutta percha and India rubber, and a similar improvement, but in a different direction and for different purposes, is growing up from the use of slate.

Our shop fronts, for example, are not to be surpassed for grandeur, if they be sometimes deficient in taste, but there is yet much to be desired, on the score of cleanliness and decency, in the shops of our butchers, fishmongers, greengrocers, and others. The Exhibition has probably made many persons notice the two or three butchers' shops on the left hand side, at Knightsbridge, near Albert-gate, one kept by Mr. Cowell, another by Mr. Jeffery, and a third by Mr. Betts, which are lined throughout with white glazed tiles, have marble slabs, and a cool, cleanly, wholesome appearance, similar to the butchers' shops in Belgium and Holland. In the arrangements of such shops, which are found in every street, elegance and cleanliness of this kind are yet much to be desired, and the many applications now made of slate, of glass, and of earthenware offer the means of obtaining both cleanliness and elegance, for the shops of the masses at a cheap rate.

It is not sufficient to provide somewhat better dwellings for the humbler classes, to withdraw alone the sea of our misery from them—it is confined, they must have an example set them by those immediately above them of elegance and refinement. Something may be done to promote cleanliness amongst them at home if they see it abroad; and to make the shops where they buy their provisions of all kinds elegant and clean, will induce them to introduce similar qualities into their houses. Were they to become even fastidiously nice, we are not sure that it would not improve their morals. Handsome clothing, which people are afraid to injure, is a check on filthiness and intemperance. The enjoyment of a splendid public-house, even, makes people dislike meanness and squalor at home. It may be inferred, therefore, that in proportion as all the common shops become cleanly and elegant, the homes of the lower classes will be improved. The Exhibition will not fully answer its purpose if it do not extend such improvements as we notice in the butchers' shops at Knightsbridge to other shops, and promote much refinement in our domestic arrangements, diffusing it through every establishment of the metropolis and the empire. The probability that slate will come much into use for such purposes will encourage a new working of the quarries of Ireland, and help to enrich it and improve its industry. Its other minerals, porcelain clays, &c., may become mines of wealth to an industrious people

Men are not now to learn, though gutta percha, caoutchouc, and slate have lately impressed the truth on our attention, that the qualities of matter require to be developed by man, if it may not be said that they lie more in the human mind than in the material themselves. Knowledge and skill, as in making bodies electrical or magnetical, or more than find out qualities—they impart or create them. Man, however, knows not yet what are his own powers, nor the powers that are around him. He knows that there are more potent spirits to be evoked from the material world than ever witchcraft dreamed of in its fabled: and he knows that, with diligence—a spell more commanding than Solomon's ring—he can summon them to his aid, and they come: but to what extent they will serve him, he has yet to learn. In sentient, but not always dumb animals, as well as in *inscentient* matter, powers are continually manifested that man had not previously discovered, and which contribute to his greatness, as "the head and tongue of all." The whole universe, which ignorance calls inanimate, is instinct with living power, and man seems capable of comprehending and using this branch of knowledge, however, phatically somewhat slowly. It may be only to imitate generally the most industrious and skilful amongst themselves, to be a great industrial nation. We shall have occasion to notice other examples of their attainments, but, in this department, a Mr. Deering, of Middleton, county of Cork, exhibits cotton from Rostellan, and articles manufactured from them, including glass and earthenware, which may help to teach the Irish what they must learn, and what they must do, to hold their place on the earth. They have been unfortunate in preserving amongst them still a late period, as is common indeed wherever servitude predominates and freedom is limited, a fashion of thought of providing industry, which smites it with palsy, and impedes the acquisition of dominion over the potent spirits of the world. Their country teems with minerals, and the little show they make under this head is one evidence of how much their many natural advantages are neglected.

The Irish, in the class of chemical and pharmaceutical products, show kelp and potass, sulphate of soda, iodine, and other products of seaweeds. Mr. Bullock's contribution, from Galway, and Mr. Wood's, from Ramelton, are creditable. Mr. Gibson's bleaching-powder and carbonates of magnesia from Dublin; and Sir John Murray, Physician to the Lord-Lieutenant, exhibits some fluid camphor and magnesia: but Ireland, erewhile celebrated for her Kirwans, her Chenevixes, and other chemical philosophers, seems in the chemical arts to have yet to learn, or have kept up to her neighbours. We should have been inclined to include glue and starch rather amongst the products of chemical arts, than amongst "substances used as food," where such articles from Belfast are placed. They do not, however, add much to the number, and would, if their place were changed, only lessen her contributions to this latter class, which are confined to samples of wheat, oats, and barley grown in Kilkenny; to black barley grown at Ballymore, Roscommon, from African seed; to some "preserved pig," to some linseed, and rape, oils and cakes, and other trifles. It would have been well had specimens of the crops of Ireland been exhibited, that all the world might have learned what are "lumpers," and been taught to avoid the exclusive use of a root that has half destroyed a nation.

In Class 4, Vegetable and Animal Substances used in Manufactures, the Irish make something like a national appearance. The Royal Belfast Flax Improvement Society has brought together the various kinds of flax grown in Ireland, and shows the article in all its stages, from the growing plant till it reaches the hand of the spinner. The collection illustrates in a very striking manner the importance of care in the operations of the agriculturist, and of the manufacturer of flax in its earlier stages. The specimens vary in value from £38 per ton as grown and prepared in Monaghan, to £100 per ton as grown and prepared in Antrim. Here is the same raw material three times as valuable in one case as in another, all the difference being the consequence of labour and skill. Besides flax, the Irish exhibit specimens of long wool from Meath and Kilkenny, and short wool from Wicklow, and samples of starch and wood and vegetable gums. The Scotch, or at least a Scotch firm, the Messrs Lawson and Son, have an excellent collection admirably arranged, exhibiting together an immense quantity of the natural products of Scotland: but Ireland has only the collection of flax made by the Royal Belfast Flax Improvement Society, to preserve her nationality in the Exhibition.

In Classes 5, 6, 7, 8, 9, all relating to mechanical contrivances, to ships, steam-engines, agricultural implements, philosophical instruments, &c., which includes most of the things of which the arts in general are proud, the Irish make a poor show. In the machine department we find catalogued a registered boat-propeller and water-wheel; but amongst the mass of such articles with a confused arrangement, the articles not being regularly placed or numbered, nor classified, nor even not always technically arranged, we sought for it in vain, and concluded, therefore, that it is of little importance. An improved pump, by a Mr. Daly, of Limerick; a railway break, which we judge to be not very useful; several jaunting and other cars; one or two improved carriages, such as a clarence and a brougham, are all that is exhibited in Class 5 from Ireland. In Class 6, including the most important of our contrivances, an improved Jacquard loom for weaving damask or other figured fabrics, a flax-seed machine for clearing the flax of the seed-vessels and collecting the seed, and a machine for ruling paper, are nearly all the contributions from Ireland. Considering the wonderful importance at present of machinery to mankind, we should say, were it not that Irish talents are employed in England, that the poverty of Ireland in this branch is a sad, but decisive proof of the backwardness of the Irish, and of the impossibility of their standing their ground in these days of keen and unavoidable competition. In Class 7 (civil engineering, &c.) we find some models by Mr. Turner, of Dublin, constructed on a scale for a building for the Exhibition for a winter garden at Berlin, which bespeak considerable talent. There are, too, some improved combustion grates by Mr. Birmingham, of Dublin and sundry models of improved sashes and windows. Other contributions from Ireland to this important branch of human art we have been unable to detect.

The Irish have never been conspicuous for their naval skill, though some of their currachs on the west coast and some of their Youghall luggers are amazingly well adapted to the human purposes of the Atlantic, and accordingly their contributions to the naval part of the Exhibition (Class 8) are confined to a solitary boat pump of little importance, and to a machine constructed of brass, with springs, of the shape of a ship, on which vessels of all kinds may be modelled. Each piece of the mechanism corresponding to the principal floors, timbers, transomes, &c., of a vessel, is provided with a spring, and capable of being adjusted in any desirable position, so as to form the skeleton of a vessel of any shape approximating to the usual form of vessel. We are afraid, however, that compasses and lines, and moulds will still be found indispensable: and such a great revolution is now threatened in the shape of vessels, that the machine is not likely to be of much use. As the main contribution of Ireland to the Naval part of the Exhibition, it is worth mentioning. It can scarcely be called the only one, for Lord Monteagle exhibits the model of a curragh now in use on the west coast. In arms, placed in the same class (8), the Dublin manufacturers are more successful; and two exhibitors, Messrs. E. Tranter, and Messrs. Williams and John Rigby, may fairly compete with the best manufacturers of London or Birmingham as to revolvers, double rifles and hair-triggers, and as to fitting out a sportsman either for our own stubbles and moors, or for the more arduous pursuits of a Murray in America, or a Gordon Cumming in Africa.

In proportion as the Irish are neither great on the sea nor in manufacturing, they must be great in agriculture. They are emphatically an agricultural people, coming up to the *beau ideal* of our modern Arcadians, who believe that towns are hotbeds of vices and crimes, and who have actually given utterance to the assertion that mankind would be the better if the plough passed over our manufacturing cities and rooted out all the (we had almost said divine) skill which grows up in them. We looked naturally, therefore, for a display of Irish ingenuity in the class of agricultural implements. We have found it after a somewhat minute search amongst nearly 300 contributors to this class, models of a cart, a carriage, a pulverizing grubber, a scuffler, a turnip-dibbler, an apparatus for making butter without handling, by one exhibitor, the Rev. Mr. La Touche; a manchine for watering plants, and some improved safety kettles, and steaming apparatus for preparing food for cattle, by two other exhibitors. None of these implements are of much importance, or likely to make the fortune and confer lasting honour on the inventors, like the American reaping machine. In fact, the contributions of Ireland to the vast body of machines and implements which do honour to the classes connected with agriculture in England are nearly as insignificant as its contributions to our naval gallery. The explanation of the fact lies on the surface, but it is instructive. Agriculture is carried on in Ireland by peasants or small farmers. It is conducted almost entirely by manual labour. Even animal labour is comparatively little employed. The Irish, consequently, have no agricultural implements of importance, and could not use them if they had them. Their small holdings compel them to perform nearly all their work by hand. They can only live by manual labour. Such small holdings, therefore, are incompatible with the use of machinery in agriculture. This relation exists now, it has always existed, probably, always will exist. At present, however, and the case is likely to be more so year after, implements and machinery are means for compelling the potent spirits of the air and the earth, of water and fire, of electricity and magnetism, to do much drudging for man. The agriculturist can only keep pace with other classes, can only find their labour equal in value to the labour of other men in the common market, in proportion as they obtain the aid of implements and machinery. To maintain and preserve, by laws of any kind, a cultivation of the soil by proprietor or peasantry, like the French or the Belgian cultivators, is to doom the agriculturist to work in a great measure without the aid of implements and machinery, and is to keep them for ever in a low and degraded position. It makes their labour—independent as are its productions—less valuable in exact proportion as the implements and machinery of other men. Laws for changing this state of things, which is incompatible with the invention and use of new and improved machinery.

Class 10, philosophical, musical, horological, and surgical instruments, numbers some 740 exhibitors, and amongst them we do not find above a dozen that come from Ireland. There are gold and silver watches of Dublin manufacture, a surgical instrument used in lithotrity, a barometer, a theodolite, and some other mathematical instruments; an hydrometer, a pump for medical and other purposes, a pneumatic battery for igniting gunpowder in blasting operations, a double-actioned harp (a powerful and highly embellished instrument), a lever for keeping open a horse's mouth when administering medicine, a double stethescope made of gutta percha, a useful hydraulic safety-lamp (the employment of water guarding against ignitions, and a syphon adapted to garden waterings. None of these can be characterised as great inventions or improvements, but they make up the sum of the exhibition from Ireland in this important class.

How the people of Ireland are clothed, we can scarcely learn from the Exhibition. Specimens of poplin, of linen, and damasks, of some mixed fabrics, there are, which have already been noticed. Here is one specimen of home-made frieze, and a few specimens of frieze and woollen cloth, but they are as nothing compared to the cloth exhibited from France, France, and Holland Only a short time ago, under the guidance of the present Lord Lieutenant, the Irish were to use only their own manufactures which, as we may infer from the Exhibition, was one of Mr. O'Connell's many dreams. There are few or no specimens of those native manufactures extant; and we must still believe, as we are afraid, with Fodge, the bulk of the Irish are clothed with the cast-off rags of the beggars of England. In cotton, there is one exhibitor who shows some "free-labour" cotton goods, his object apparently being rather to discountenance slavery than promote ingenuity and skill. Cotton manufactures have been planted in Ireland, and we hope they are growing into importance, but no specimens are exhibited. The Irish show, in Leather and Harness, snake's-head bits, improved saddles, including a hunting saddle with an elastic seat, portmanteaus and camp furniture, boots in process of manufacture, the leather tanned in sumach, various kinds of boots and shoes made from leather chiefly the produce and manufacture of Ireland; they show, too, in the same class, some ornaments for the person, such as wigs and ladies' head-dresses; but, on the whole of the division of clothing, except of linen, is nearly as scanty as their exhibition of other articles. Amongst the articles of "papers," &c., they have something unique; "original poems by H. Ellis, the exhibitor." We have not read these specimens of Ireland's Muse, and cannot say whether they surpass the music of Moore and the pathos of Kennedy.

The Irish display in lace and embroidery both taste and industry. Specimens are exhibited by Messrs. Lambert and Bury, of Limerick, and Messrs. Forrest and Sons, of Limerick and Dublin. The "Irish Work Society" exhibit specimens of crochet, and of Leghorn plait, of embroidery and plain work from convents and individuals, which do credit to the society. There are specimens, too, of knitting, of various kinds of fancy work, of floor-cloth, 16 yard, by 6, woven in one piece; of mats by Bell, of Limerick lace shawls and handkerchiefs, made under the patronage of another Ladies' Industrial Society; of trimming lace, and embroidered muslin—the last executed by charity children of Cangort Park, King's-county; of lace flounces, worked by the poor girls of Kilmanile, the work having been begun, very much to their credit, in the year of the great famine to save themselves from starving; of needlework in imitation of line engraving, which does credit to Mrs. Ward of Coleraine, though not quite equal to painting. These, with various other light matters, show that the Irish females want not the skill of the Swiss and the Belgian lace-makers, though they produce nothing to compare with the exquisite work from these two countries. Mrs. Letitia Veevers deserves particular mention as having produced pocket handkerchiefs and lace, shawls and scarfs, a parasol and a veil, with a variety of other articles, from the fibres of the common nettle, from the hemp nettle, and from the *Lavatera*, the marsh-mallow, &c. Though not so valuable in this respect as flax, and not therefore, at all likely to supersede it, such productions serve to inform us, or to remind us if we have known it before, that numerous plants can be used as substitutes for flax, and that even the nettle can, by industry, be turned into bread and gold. Female talent has much the same opportunities in Ireland as in other countries and, in contrast with male talent, shows to greater advantage, being in all countries rather hand-labour than labour by complicated machinery and, accordingly, the productions of the females are, in proportion amongst the most respectable from Ireland. Among articles for immediate use, there is a winter and a summer overcoat combined in one made of frieze and tabinet, and capable, as if it were intended for a cheap disguise, of many transformations; twilled stockings, buckskin breeches, straw plait made from "crested dog's tail," and Balbriggan stockings. This class is not a large one, and the Irish have in it a fair share.

In articles of cutlery we find only one exhibitor from Ireland whose productions are anything superior. In general hardware, though the number of exhibitors is on the whole great, there are few from Ireland One manufacturer, from Belfast, who also hails from Huddersfield, exhibits a fire-box, with hollow fire-bars, for locomotives, which seems an improvement. Another, from Limerick, has a model of a stove for heating conservatories and public buildings; but he does not promise, at present, to supersede Dr. Reid. Some silver-mounted clarence carriage lamps, some bells, for an altar, one mounted on a frame of bog-oak, some patent composition pipes for the conveyance of gas, a wrought-iron double-cased safe with secret lock, which cannot be opened unless the secret be known, though it is not said that Mr. Hobbs would not discover it, nearly make up the sum of the Irish contributions to this great branch of national industry. Bonnet, we must add, has exerted himself successfully to provide improved signal-lights for railways, and his fixed signals, and his signals for guards and others to carry in the hand, the former adopted on the Great Southern and Western Railway, Ireland, saving nearly one-half of the expense of the ordinary fixed signal-posts, are valuable, and may help to warn engineers of danger and to save lives

In jewellery the Irish exhibit articles embellished with Irish pearls, a case of which is placed, unfortunately, amongst the minerals. These jewels are obtained in the river Roule, county Tyrone, from a species of fresh-water mussel, and, though only found now and then, are sometimes of considerable size and beauty, fetching forty or even fifty pounds. United with other gems in designs copied from antique Irish ornaments, they make in the jewellery of Messrs. West and Son a handsome display. Their collection of brooches, bracelets, necklaces, and various other ornaments of oxidised silver, and of gold and oxidised silver mixed, is numerous and creditable to their skill. Mr. Connell, of Nassau-street, Dublin, has a very considerable collection of ornaments, and of useful articles made of bog-oak, found in the lakes of Killarney, mounted in gold from Wicklow, and set with rich diamonds. Many of them are in good taste, and many are elaborately carved. There is a cup ornamented with designs from scenes at Donnybrook Fair, and we must always regard with favour those artists who prefer illustrating the manners of their own countrymen, to adopting scenes from classical antiquity. Donnybrook Fair in passing events, and we shall soon have no other memorial of it than the writings of poets and designs of artists. Another article, an inkstand, is adorned with representations of Irish strolling musicians, and Mr. Connell's collection is natural as well as tasteful. He exhibits, too, a number of small articles of bog-oak from the arbutus wood, grown in the neighbourhood of the lakes of Killarney, of which the carving and ornaments are neat. A carved oak casket by Mr. Julius Mosley, of white and red bog yew, with figures in alto relievo, does not please us as well, because the subjects represented are allegorical or scriptural, about which the artist cannot know so much as he may learn and transmit of the manners of his own countrymen. Yet is Mr. Mosley one of the exhibitors whose skill reflects honour on Ireland. Mr. Waterhouse has a large collection of brooches made from the mineral products of Ireland, including the precious metals. They rather astonished us by their size, till we learned that they were intended for cloaks and shawls, and are strong fastenings, like buckles. Generally they are appropriate in their designs, and have none of those incongruities of style, such as bleeding hearts and bunches of grapes to make ornamental fastenings.

The plate manufactured from silver obtained from the mines of Ireland, and exhibited by Mr. Bennet, of George-street, Dublin, is generally handsome, though we do not like the covenant in it silver; and the finished articles, of considerable value, shew how much may be made of the natural products of Ireland, when intelligence guides the hand to industry. The show of jewellery, though small in comparison with the immense collection from this branch, speaks well for the workmanship and taste of the Irish manufacturers.

The manufacture of glass has of late made great progress, in which Ireland has participated to a small degree. The ornamental centre-piece, from the Waterford Glass Works, and the cut-glass decanters, vases, and covers, are the results of the progress. Besides these, the watch-glasses, in all stages of manufacture, the Irish exhibit nothing in glass. In porcelain, that most elegant of wares, to which every kind of knowledge, of design, of colour, and of taste can be given, to improve which many arts combine, and which, in turn, lends itself to assist other arts in which the French, the Prussians, the Saxons, the Austrians, and the English vie with each other, and each boasts of excellence, the Irish do not exhibit a single piece. Yet Ireland is not without porcelain clay, and may yet be enriched by an art which for ages has contributed to embellish the dwellings of man, to supply his wants, and promote health and cleanliness.

We are inclined to regard the decorative furniture, made by Mr. Jones, of Stephen's-green, Dublin, after the Belfast linens and damasks and Dublin poplins, as amongst the most striking objects in the Exhibition that come from Ireland. We speak of it nearly last; if we had placed the object of our remarks in the order of excellence, we should have spoken of it first. It is all made of bog oak, and is Irish throughout. The designs are all emblematical of Ireland; they are borrowed from her history, which they illustrate, and are well carried out. Her peculiar animals, her peculiar vegetable productions, her antiquities, all find a place in the various portions of this elaborate ornaments and all fresh. The series display throughout one conception and one mind, and the conception is carried out cleverly. Some of the pieces sin against the canons of criticism; but the eye forgets them, and praises Mr. Jones. In all there are 18 pieces—a side table, washing-stand, tea-pot, an ommum, an arm-chair, a horse-shoe wine table, a sarcophagus wine-cooler, music temple, &c., a surprising some of more, others of less beauty, but they compose as complete a series of historical or emblematical illustrations in carved furniture as we have ever seen with. Both in design and execution, as well as in the material selected, a product of the Irish bogs, this series of furniture is intensely Irish, and does honour to the patriotism and skill of Mr. Jones. It is undoubtedly one of the gems of Irish art. The other furniture from Ireland stands far behind this; yet are the cabinet of oak, by Mr. Mitchell, the carved devotional chair of Mr. Bell, made of bog oak; and the arm-chair made of similar materials and carved with fruit and foliage from nature and grotesque figures—the work of three men at Lisburn, county of Antrim, during eight months, prepared expressly for the Exhibition—not unworthy of mention. They all supply evidence, that in the Irish there is much latent skill, which only requires opportunity to manifest itself by appropriate products.

Classed with mosaics and enamels, is a table which we had almost overlooked. In the Catalogue it is described as a glass-metal table. The pillar represents a fighting gladiator on one knee, with the short Roman sword in his right hand, and on his left arm a shield, which constitutes the table. If it should be in use, the unhappy persons who were sitting round it might be wounded in the vermilion of the furious fighter, while they could have little confidence in the stability of a table the representation of an instrument in perpetual motion to defend the combatant. The carved figure supporting the table has neither grace nor anatomical cleverness to relieve the incongruity of the design; and we can by no means applaud Mr. Thatcher's gladiatorial table.

Some unimportant things we must necessarily pass over, such as a table, painted to represent stone; a dressing-case made of bog yew, with silver fittings from the mines of Wicklow; specimens of excentric ivory turning, which are well executed; specimens of chromo-lithography printed at Belfast; collections of soap for all uses, manufactured at Dublin and Clonmel; a basket of fruit and flowers, carved in sycamore; a model of the ancient Irish harp, of Brian Boroihme, which has been very properly restored, that it may be adopted instead of any other harp in all emblematical devices of Ireland: but, we believe, we have referred to the chief articles in the Exhibition coming from Ireland. On the whole, the sister Island, though her contributions are very small, has come up to our expectation. They were insignificant, and they are realised. We regret to say that of the seven millions of persons which inhabit Ireland, equalling in numbers the inhabitants of Holland and Belgium; but we were pretty well acquainted with their productions,

nd we knew that a people in their condition cannot show much worthy of the admiration of civilised man. In matters of mere taste, n which some savage nations have made themselves conspicuous, they nay not be behind other people. Indeed, we are disposed to say, from a nasty comparison between the furniture we have alluded to, and the generally cumbrous, unmeaning ornaments of much of our own furniture, that in point of taste they are equal to their neighbours. But, in ll the more solid and necessary works, which grow rather from general nlightenment, than from individual genius, the Irish are deficient. The Exhibition illustrates their condition, and will not be without use to them, should it add to the conviction that it is now equally dis reditable to them and their immediate guides and rulers and to the general government of the empire.

PRINTED FABRICS.

BRITISH.

N no department of the Great Exhibition would it be possible for the critic to feel himself less at home than in this important branch of human industry, since the excellences which are so manifold, the processes so ingenious and scientific, the artistic results, though too often perverted, so great, that no adequate description can be given of the various points o which it is desirable to draw attention, as illustrative of the progress of a trade which has been so rapidly and wonderfully developed during the last half-century. The results of the highest chemical knowledge in combination with some of the greatest triumphs of mechanical skill are o be found in the various branches of the print trade as displayed on his occasion; and, taking Manchester as an example, however much we may have been disposed to express our disappointment at the paucity of the Exposition in other departments of its trade, we are certainly inclined to give credit to the manufacturers of that locality for a very fair average display of their capabilities to do great things in the printing of all those fabrics for the production of which Manchester is the great centre.

Much more might have been done, we are quite sure; but what has been done is so satisfactory as regards the present position of this branch of industry, that every one must feel pleased that, in this respect, at least, an effort had been made to give something like a distinct representation of products which, in a commercial point of view too much importance cannot be attached. For when it is considered how many hundreds of thousands are dependent upon its successful development or employment and permanent prosperity, the amount of capital embarked therein, and the talent, skill, and ingenuity constantly exercised and being educed by its operations, its non-representation on an occasion like this would have partaken of the character of a national calamity, since most erroneous impressions would have been the result.

It would be quite out of the question to give any detailed account of the recent improvements and discoveries in the chemistry of colour, or inventions in mechanics as applied to calico printing, since the progress of this, probably the most scientific and ingenious of all the mechanical arts, is a constant succession of changes, improvements, discoveries, and inventions, from the time when the founder of the Peel family commenced his operations in the neighbourhood of Blackburn, to the present day. Many persons may be disposed to doubt, after all, whether any great benefit has resulted to the arts of design by the enormous facilities now afforded for the perfect imitation of any artistic effect, or the introduction of almost any number of colours into the printing of a pattern. This, however, is rather a question of rightly applying the facilities afforded, than in restraining the printer to those obsolete methods; and, absolutely, the power to do has led from step to step in the direction of the purely imitative, and the choice, rather than taste of the people, has been so led on from one point of excellence in mechanical and chemical means to another, that the first principles on which the trade ought to be based has been forgotten, and the result is, that, with great power to do, the thing done is that which ought rather to be avoided than attempted. The severely critical on this point, however, must not fail to remember, that, however perfect the principle in its abstract may be, a judicious deviation, according to the wants and requirements of an age and a people, is rather a merit than otherwise; so that, whilst utterly repudiating the frequent exaggerations to be found in the use of mechanical means and appliances, we do greatly admire, and would willingly defend, that perfect and complete use of the means within our power, which, whilst seeking to improve, yet at the same time keeps steadily in view the purpose, the nature, and the limits of the fabric to be originated, and, above all things, takes care that it shall appear to be what it really is.

The three localities which appear as the great exponents of the British print trade are London, Manchester, and Glasgow. The former, the neighbourhood in which was at one time so famous, has become more or less identified in its reputation with the other two; for though print-works still exist within a comparatively short distance of London, and many of the best, in some departments the very best, examples are produced at establishments which arose in the palmy days of the London print trade, still the great mass of the specimens of the various kinds of printing are rather the productions of Manchester and Glasgow than of London. The contributions, however, are classified under the three heads, and each has its special allotment, within which arrangements are made for the complete display of the goods exhibited; and there are certainly few departments into which even the uninitiated can walk, where more pleasurable sensations will be engendered, than in running the eye over the clear-looking and prettily arranged dress pieces in all the various hues of madder or steam colours—from the sober chocolate or bright pink of the former, to the gay yellow and green introductions of the latter. All the leading houses are well represented, and no pains appears to have been spared to do full justice to the excellences of each, so far as fittings and the arrangement of the various contributions are concerned.

LONDON.

The Metropolitan Exposition consists partly of those exhibitors who print for themselves as well as for others, and of the contributions of those who possess the exclusive right to certain patterns or styles, and therefore, though not printers themselves, appear in the character of proprietors; and there cannot be any doubt, that many of the calico printers of the north were largely influenced against the Exhibition, almost to opposition, by their London customers, who secure to themselves the exclusive privilege of the sale of certain classes of goods, and who fancied that the display of these productions by the veritable producers might have some serious effect upon their business; as if anybody believed that a tithe of the calicos sold as "London prints" were executed in or near London, or, indeed, that any person in the metropolis had anything to do with them except to buy and sell again. There are, of course, exceptions in this respect, and, occasionally, warehousemen and shopkeepers do give hints as to style and patterns; and, as their practical acquaintance with the prevailing opinions, or bias in a given direction, miscalled public taste, is often of great value to the manufacturer, who must of necessity cater to these whims, he regards the buyer from him and seller to the public as somewhat of an oracle; but, like most oracles, he is not always so lucky in his guess as he might be; and the consequence is, that some oddity, whose only recommendation is its novelty, will not sell, in spite of pushing and bepraising, whilst a less ostentatious-looking article is, perhaps, quietly taking a steady run without trouble to manufacturers or salesmen: and it is a fact worth recording, that simple and quiet-looking prints, by Liddlards or Hoyles, have been sold in thousands of pieces, whilst some flashy attempt at something "very new" has scarcely attracted a customer. This is one of the great peculiarities of the print trade. Fortunes have been realised out of "one style," almost out of one pattern, and almost lost again by unsuccessful productions that people would not buy at any price.

Proceeding to our detailed consideration of the contributions of the various exhibitors, we first notice the very superior examples of printed table-covers displayed by Messrs. David Evans and Co. (1). These are remarkable specimens of the perfection to which fabric-printing has attained in this country. The effects are broadly and artistically produced; the examples are, therefore, more characteristic of the warehouse than the shop, and of the perfection attained by single manufacturers, than in illustration of the excellence of several, and all different in their kind.

F. Steiner and Co., Church, near Accrington (37), exhibit Turkey red velvets of good character, printed by machines. The damask effects produced by printing a black figure upon the brilliant dye is very excellent. The chintzes effects are excessively crude in colour, the yellows being most offensive in contrast with the green and red.

An excellent exposition of useful prints is made by Messrs. Salis Schwabe, and Co. (41). This is one of our largest printing-houses, and the specimens sustain the reputation of the house. The patterns are generally well selected, and are adapted to the middle and lower-class markets. They are chiefly madder colours. The muslins are bold and effective, but lack the elegance of some of the calicoes.

Mr. J. N. Sale's collection of shirtings and cottons is a very admirable one. They are exceedingly good examples of this class of goods—clear, neat, and remarkably well chosen in pattern, so far at least as these articles generally go. Of course, the usual amount of unmeaning subject for the "fast man" is to be found, but there is nothing obtrusive, and still less offensive, in the generality of the patterns.

Messrs. W. Benecke and Co. (44) present a varied display of dress goods, furnitures, and velvets. In these latter there are some admirable effects of chintz printing, the colours being rich and harmonious, and the treatment of subject broad and artistic, but, as usual, too imitative. Some of the muslin patterns are elegant and well selected, but in others the drawing is vulgar and the forms objectionable, from their clumsiness and inelegance.

"Hoyle's prints" are famous everywhere, or at least wherever printed cottons are worn, and the contribution of Messrs Thomas Hoyle and Sons fully sustains the well-established reputation of the house, though it is formed of nothing more than examples of their usual supply to their customers. Perhaps, however, we should except the very beautiful specimen of muslin, printed from a cylinder, engraved by the anaglyphic process, or, as it is usually termed, by an adaptation of Lockett's eccentrics to the copying of a species of *bas relief*. The effect of this example is rich and silk-like, and perfectly novel in its results on so large a scale. The pattern is admirably designed and adapted to the purpose, having an elegantly damasked appearance. The smaller patterns in madder colours by this firm are always the most noticeable features in their productions, and in the display now made of coarse take the lead. For wear, they are at once elegant and economical.

Messrs. Simpson and Young (47) exhibit balzarines, barèges, mousselines de laine, cambrics, and cotton velvets. The specimens of the latter are very excellent, their clearness and colour being unexceptionable. There are many admirable features in the other fabrics, but the taste displayed is generally below the average. One or two of the smaller patterns are pretty and effective; but the mousselines de laine in the shawl style are rather heavy. In one, a readaptation of the "pine" conventionality has been adopted; but it comes back to the same point as all its predecessors, and is a "pine" at last

Mr. J. Mercer, of Accrington (48), exhibits the results of an interesting discovery of the result of the action of caustic soda in preparing cloth for the purposes of calico printing. In noticing the examples of cotton manufacture, the importance of this invention was alluded to and its purpose explained; but, though so valuable in the improvement of the texture of cotton cloth, yet it is not less so in the greater brilliancy it gives to the colours used in printing; and the specimens shown by Mr. Mercer, in which an example of printing by the usual process, or without his preparation, and one in the same colours in which it is used, being stitched together, fully demonstrate its value by the superior brilliancy of dye which is produced thereby. In short, this discovery is one of the most important to which the Great Exhibition has given publicity.

Messrs. Bayley and Craven (34) make a very superior display of fast lilacs, madder colours, &c. The styles are generally well selected, and the greater number of the patterns are eminently textile. The designs, too, are mostly of the medium size, without running into the extremes of neatness or of blotch in effect. Altogether, this is a tasteful and satisfactory exposition of a useful class of prints; and the same may be said of those exhibited by Messrs. Swanwick and Johnson (35). These make up an assortment of those things most in demand. Extravagances of all kinds are carefully avoided, and the dresses are such as a lady can wear—clear, light, and ornamental. Stripes prevail, and are unobjectionable in treatment. In some prints, perhaps, a little more "spot" would have been an improvement

Messrs. Thomson Brothers and Sons (24) exhibit silk chints and mousselines de laine. The colour and force thrown into the latter, causes the examples of the former to look indefinite in design: they are, on the contrary, however, characterised by great clearness and distinctness. This house has long held a high position. The taste displayed in its productions is generally good, and the brilliancy of dyes in de laines and cashmeres always a noticeable feature. The calicoes exhibited are clear, tasteful, and effective.

Messrs. H. Bannerman and Son make a display of fabrics printed with silver, suitable for theatrical dresses, gay bindings of books, and many purposes where the magnificence was only intended to be of a temporary character, since the splendour may be "done" at a very small comparative cost. For furniture purposes—such as hangings, &c., these productions would be "shams," which no sensible person would tolerate for a moment.

Messrs. Edmund Potter and Co. (30) contribute largely in the class of goods they usually supply to the home market, and make an elegant and tasteful exposition of the prevailing character of dress goods. Without any particular pretension in design, there is a large amount of artistic discrimination shown in the selection of the patterns. The printing is unexceptionable, and the dyes clear and brilliant, the colours being pinks, purples, chocolates, and also "half mournings," or black and white. The small patterns are very superior, and being adapted to children's dresses, are always largely in demand, and form an important item in the staple productions of Manchester.

The Strines Printing Company, and Messrs. Nelson, Knowles, and Co., exhibit examples of their similar styles. The cotton velvets of the former house are good, while the examples of machine printed chintzes by the latter, intended for the Brazilian and Mexican markets, are worthy of notice for their peculiarity. The specimens of six coloured barège printing, too, are very excellent. The "fourteen" coloured operation in furniture printing by machine is more curious than the result is beautiful, and we are disposed to question the value of this wholesale introduction of numerous colours to produce one effect. It may be very wonderful, but it is never worth the trouble.

Messrs. R. Dalglish, Falconer, and Co. (37), show a very important series of prints, in a commercial point of view. The patterns are generally good—some of them very elegant; and the textile character is well sustained. The muslins are broad and effective in drawing and general treatment, and the machine chintzes very superior. The examples, too, of Messrs. J. Burd and Sons (26) are well selected. Some two or three are very superior, being in excellent taste as textile patterns. The small patterns are generally very good, but the furnitures are very heavy. The covering of the front and sides of the contents with a patchwork assortment of the most vulgar-looking furnitures we have lately seen, detracts very much from the real excellence of the dress goods displayed.

GLASGOW.

We question very much if Glasgow can be really said to be fairly represented in the Great Exhibition, so far as the print trade is concerned. It is quite true that there are specimens of all kinds, from the most outrageous of furnitures or pocket-handkerchiefs to the prettiest and most effective of cambrics and muslins. Still, we cannot but think that there are many points which are left unillustrated. As it is, however, whilst there is much to astonish by its ultra-ugliness, there is also much to admire for its intrinsic merit and beauty; and the displays of Messrs. James Black and Co., and Messrs. W. Gourlie and Son, are quite sufficient to redeem the character of the commercial metropolis of Scotland.

Messrs. James Black and Co. (51) exhibit an admirable and extensive collection of muslins, cambrics, mousselines de laine, and barèges, the variety of pattern of which is very great. The chintz effects are excellent, and the colours well selected, being at once brilliant without too great a contrast—a feature of no little moment in producing a satisfactory result. The small patterns are also, in general, very pleasing; in short, the whole display is one of great merit. This house also illustrates, in an ingenious and satisfactory manner, the processes of calico printing, by examples, mounted in two large glazed frames, with succinct and intelligible descriptions of the modes of preparation, printing, and dyeing. A careful examination of these shows the character of the manufacture in a very striking manner.

The exposition of Messrs. W. Gourlie and Son (52) is also a highly creditable one. The muslins and cambrics are well selected in pattern and general character, and the work is very superior. Messrs. John Monteith and Co. (53) exhibit a very first-rate series of examples of the various classes of printed goods, muslins, jaconets, and mixed fabrics. The machine work, as shown here, is of a very superior character. The patterns are generally well selected, though occasionally too much is aimed at.

The Turkey red dyeing and printing of Messrs. Stirlings and Sons (54) are excellent in their style, which is in the extreme of the shawl patterns of India. There is a clearness and distinctness about the details of the "pines" which we should scarcely have thought practicable in such work. The machine furnitures of Messrs. Orr, Ewing, and Co. are worthy of attention, as good examples of their class. But the display of Messrs. H. Monteith and Co. is the most extraordinary one, so far as taste is concerned—handkerchiefs and

Messrs. Baker, Tucker, and Co., Gresham-street, make a very pleasing exposition of printed British and India silk handkerchiefs. Those in the Indian shawl pattern—that everlasting "pine," prevail, and are characterised by great beauty in colour, and excellence in workmanship; the printing and dyeing being of great merit. The engraving of some of the "stippled" examples is very fine, the drawing being also very good. We object, in principle, to the extent to which this is carried, the result not being sufficiently textile. In a trade like this, however, with the wants of so many classes of persons to cater for, great diversity of subject is required; and the flashy-looking bandanna claims patronage from one class, because it is very gay, whilst the quiet-looking, cambric-like pattern takes the fancy of another, from its very opposite quality. On the whole, Messrs. Baker, Tucker, and Co.'s display is a highly satisfactory one.

Messrs. Liddiard and Co., Friday-street (3), and Messrs. Hargreaves and Co., Manchester (38), may be noticed at the same time, as also the contributions of Messrs. Swan and Edgar (9), as these are all executed by the former for the exclusive use of the latter. Nothing could possibly illustrate the perfection of the art of calico-printing better than these examples. The chintz effects are wonderfully artistic; and, if perfect imitation were a true standard in textile ornamentation, then some of these specimens would be perfect. We look upon them, however, rather as proofs of what can be done, than what ought to be done. The designs generally are very elegant. A barège, with a flounce border running into a trail, based in adaptation of the pink, and in perfect textile taste, is very admirable. The butterfly patterns, too, are very ingenious, and the most elaborate is a splendid specimen of colour. The largest lilac pattern is very broad and effective, being boldly blotched in. The smaller and less ambitious-looking examples are, however, most to our taste, for their neatness and beauty. The cambrics are, in this respect, most elegant.

Messrs. Inglis and Wakefield (4) exhibit printed mousselines-de-laine on a cotton warp, printed cashmeres, balzarines, cottons, and jaconets. The designs are broad and effective, and the colours exceedingly well chosen, the India shawl patterns being good in style and well printed. Some of the dresses have a satin stripe introduced, which adds very materially to the effect, and improves the general appearance of the dress by a variation of surface and texture. Messrs Alexander and Co., late, Friday-street (5), make a very neat and tasteful exposition of mixed fabrics, shown over a printed pattern, placed beneath, as in the case of a slip under a muslin skirt. The result is very pleasing, and suggestive of a style of printing in the present fashion for enriching woven fabrics in printed grounds, might be valuable. One printed muslin shown here is especially beautiful, for its simplicity and effect.

Messrs. W. and T. Devas, Minchener, and Routledge (6), show a very superior selection of fabrics, chiefly for the use of the middle class of purchasers. These are of the usual purple, pink, or light blue tints, clear and effective; presenting rather an effect of texture than pattern. It would be difficult to select any in particular as examples of the peculiar excellence here displayed; but for sterling qualities of design, in its best, because least obtrusive application to these fabrics, it would be impossible to find their superior.

Messrs Welsh, Margetson, and Co. (7), show well-selected examples; and, as specimens of printing in their class (bandannas, cambrics, &c.), they are excellent. Of course, being pocket-handkerchiefs, we have the range of stock subjects, from bull-dogs to Indian pines. The corresponding display to this, however, shows that eccentricity of subject is certainly not essential to beauty or effect, for, in the display of Mr. W. Wilkinson, Watling-street (8), are examples which, in point of elegance and taste, could scarcely be surpassed. The handkerchiefs here exhibited, whilst admirably drawn and arranged for general effect, are also bold and accurate in detail; and there is a fitness of appropriateness about them which is quite refreshing when contrasted with some of the extraordinary subjects with which handkerchief printing appears to be degraded. In these examples the full effect, as also the purpose, has been considered; and with a due reference to nature as a foundation, the imitative is avoided beyond the point requisite to give identity and adapt the means to the end. In contrast to these, we have the ferocious-looking examples exhibited by Mr. Keymer (12), in imitation of the "needlework style" How any thing, having any regard for his eyesight could purchase a pocket-handkerchief as some of these are in the matter of design, is a problem to be solved only by those who buy them.

Messrs. Foster, Porter, and Co., Wood-street, Cheapside (16), make a very elegant display of neatly printed bandannas, in which all violent contrasts are carefully avoided. In the extensive contribution of Mr. R. Walford (19), the very reverse of this is found, and the designs are characterised by more boldness than elegance. Two or three in geometric arrangement are suggestive of something better. In printing, however, these patterns are nearly all eminently textile, and in this respect are good examples of style. Messrs. J. Mair, Sons, and Co. also show some very excellent specimens of a variety of printed fabrics, including bandannas, shirtings, and flannels. An example of printed wool de laine stained is of high merit, and unique. The design is the production of a veteran designer, Mr. Carter, sen., now upwards of eighty years of age, and for half a century or more connected with the print-works of Mr. Swainland, at Crayford, Kent. It was expressly executed by him for the Great Exhibition, as his last effort, and consists of a bed of parrots and macaws, drawn with great spirit, and perched in a variety of positions on the branches of a tree divested of foliage. The brilliant colour of the plumage of the birds tells with remarkable effect, in contrast with the subdued character of the background; and, as a specimen of the art of printing, its producer, Mr. Swainland, may congratulate himself. Should space permit us to notice the printed shawls, we shall call attention to the magnificent examples displayed by this veteran printer, now the father of high class textile printing in England, probably in Europe, inasmuch as they deserve the highest consideration.

In furniture prints, the very artistic exposition of Messrs. Swainson and Dennys, takes the lead. Some of the patterns are a little heavy in style; but one, here, has the merit of boldness, and is the most striking of its kind we have seen for a long time—pure, original, and effective. We doubt the taste of printing imitations of drapery, even for walls; and to be used for drapery it is certainly out of the legitimate purpose of decorative art. There is a want of discrimination about the whole of Messrs. M'Alpin, Stead, and Co.'s patterns, and the best are two evidently copied from, or very close imitations of, the French, as we have seen the originals any time these three years. It is really "too bad" to bring them here on an occasion like this.

Messrs. C. Hindley and Sons exhibit specimens of furnitures, the taste of which is by no means unexceptionable; indeed, there is great pretence, and very small result. In short, they are upholsterer's chintze in true upholsterer's taste (7). Messrs. J. and A. Crocker display furniture prints, the tone of which the arrangement and design of is a very superior character; but there is a certain degree of hardness in the outline and shadows which detracts much from the general effect.

Mr. Thomas Welsh, Newton Abbey, exhibits some good examples of embossed and printed cloth table-covers. The greater portion, however, of his display is arranged on the wall of the cotton machinery department, and some of the specimens are much more tasteful than these articles usually are. The colours and execution are unexceptionable.

Messrs. Yates and Taylor also exhibit specimens of embossed tablecovers, the method of producing which is very effective; but the examples shown do not adequately represent its full advantages, for the want of more artistic design. The printed table-cover displayed by Messrs. Underwood and Co., of Vere-street, Oxford-street, is an admirable specimen of printing, the design being heraldic, and intended to commemorate the Great Exhibition. It is described as being produced expressly for the Exhibition, and stated to have taken 223 blocks and copperplates in the printing. The border and centre, which are both admirably arranged, are formed of the emblazonments of the nations which exhibit, the arms of England forming the centre. The colouring in some of the examples is rich and harmonious, and the effect highly decorative.

MANCHESTER.

The great mass of the examples of printing exhibited from Manchester are very similar in general character, because, being contributed by the producers rather than by those who buy for the retail market, they show more distinctly the features common to all of their class, than as selected from the productions of various departments. The Manchester examples are, therefore, more characteristic of the warehouse than the shop, and of the perfection attained by single manufacturers, than in illustration of the excellence of several, and all different in their kind.

F. Steiner and Co., Church, near Accrington (37), exhibit Turkey red velvets of good character, printed by machines. The damask effects produced by printing a black figure upon the brilliant dye is very excellent. The chintzes effects are excessively crude in colour, the yellows being most offensive in contrast with the green and red.

An excellent exposition of useful prints is made by Messrs. Salis Schwabe, and Co. (41). This is one of our largest printing-houses, and the specimens sustain the reputation of the house. The patterns are generally well selected, and are adapted to the middle and lower-class markets. They are chiefly madder colours. The muslins are bold and effective, but lack the elegance of some of the calicoes.

Mr. J. N. Sale's collection of shirtings and cottons is a very admirable one. They are exceedingly good examples of this class of goods—clear, neat, and remarkably well chosen in pattern, so far at least as these articles generally go. Of course, the usual amount of unmeaning subject for the "fast man" is to be found, but there is nothing obtrusive, and still less offensive, in the generality of the patterns.

Messrs. W. Benecke and Co. (44) present a varied display of dress goods, furnitures, and velvets. In these latter there are some admirable effects of chintz printing, the colours being rich and harmonious, and the treatment of subject broad and artistic, but, as usual, too imitative. Some of the muslin patterns are elegant and well selected, but in others the drawing is vulgar and the forms objectionable, from their clumsiness and inelegance.

"Hoyle's prints" are famous everywhere, or at least wherever printed cottons are worn, and the contribution of Messrs Thomas Hoyle and Sons fully sustains the well-established reputation of the house, though it is formed of nothing more than examples of their usual supply to their customers. Perhaps, however, we should except the very beautiful specimen of muslin, printed from a cylinder, engraved by the anaglyphic process, or, as it is usually termed, by an adaptation of Lockett's eccentrics to the copying of a species of *bas relief*. The effect of this example is rich and silk-like, and perfectly novel in its results on so large a scale. The pattern is admirably designed and adapted to the purpose, having an elegantly damasked appearance. The smaller patterns in madder colours by this firm are always the most noticeable features in their productions, and in the display now made of coarse take the lead. For wear, they are at once elegant and economical.

Messrs. Simpson and Young (47) exhibit balzarines, barèges, mousselines de laine, cambrics, and cotton velvets. The specimens of the latter are very excellent, their clearness and colour being unexceptionable. There are many admirable features in the other fabrics, but the taste displayed is generally below the average. One or two of the smaller patterns are pretty and effective; but the mousselines de laine in the shawl style are rather heavy. In one, a readaptation of the "pine" conventionality has been adopted; but it comes back to the same point as all its predecessors, and is a "pine" at last

Mr. J. Mercer, of Accrington (48), exhibits the results of an interesting discovery of the result of the action of caustic soda in preparing cloth for the purposes of calico printing. In noticing the examples of cotton manufacture, the importance of this invention was alluded to and its purpose explained; but, though so valuable in the improvement of the texture of cotton cloth, yet it is not less so in the greater brilliancy it gives to the colours used in printing; and the specimens shown by Mr. Mercer, in which an example of printing by the usual process, or without his preparation, and one in the same colours in which it is used, being stitched together, fully demonstrate its value by the superior brilliancy of dye which is produced thereby. In short, this discovery is one of the most important to which the Great Exhibition has given publicity.

Messrs. Bayley and Craven (34) make a very superior display of fast lilacs, madder colours, &c. The styles are generally well selected, and the greater number of the patterns are eminently textile. The designs, too, are mostly of the medium size, without running into the extremes of neatness or of blotch in effect. Altogether, this is a tasteful and satisfactory exposition of a useful class of prints; and the same may be said of those exhibited by Messrs. Swanwick and Johnson (35). These make up an assortment of those things most in demand. Extravagances of all kinds are carefully avoided, and the dresses are such as a lady can wear—clear, light, and ornamental. Stripes prevail, and are unobjectionable in treatment. In some prints, perhaps, a little more "spot" would have been an improvement

Messrs. Thomson Brothers and Sons (24) exhibit silk chints and mousselines de laine. The colour and force thrown into the latter, causes the examples of the former to look indefinite in design: they are, on the contrary, however, characterised by great clearness and distinctness. This house has long held a high position. The taste displayed in its productions is generally good, and the brilliancy of dyes in de laines and cashmeres always a noticeable feature. The calicoes exhibited are clear, tasteful, and effective.

Messrs. H. Bannerman and Son make a display of fabrics printed with silver, suitable for theatrical dresses, gay bindings of books, and many purposes where the magnificence was only intended to be of a temporary character, since the splendour may be "done" at a very small comparative cost. For furniture purposes—such as hangings, &c., these productions would be "shams," which no sensible person would tolerate for a moment.

Messrs. Edmund Potter and Co. (30) contribute largely in the class of goods they usually supply to the home market, and make an elegant and tasteful exposition of the prevailing character of dress goods. Without any particular pretension in design, there is a large amount of artistic discrimination shown in the selection of the patterns. The printing is unexceptionable, and the dyes clear and brilliant, the colours being pinks, purples, chocolates, and also "half mournings," or black and white. The small patterns are very superior, and being adapted to children's dresses, are always largely in demand, and form an important item in the staple productions of Manchester.

The Strines Printing Company, and Messrs. Nelson, Knowles, and Co., exhibit examples of their similar styles. The cotton velvets of the former house are good, while the examples of machine printed chintzes by the latter, intended for the Brazilian and Mexican markets, are worthy of notice for their peculiarity. The specimens of six coloured barège printing, too, are very excellent. The "fourteen" coloured operation in furniture printing by machine is more curious than the result is beautiful, and we are disposed to question the value of this wholesale introduction of numerous colours to produce one effect. It may be very wonderful, but it is never worth the trouble.

Messrs. R. Dalglish, Falconer, and Co. (37), show a very important series of prints, in a commercial point of view. The patterns are generally good—some of them very elegant; and the textile character is well sustained. The muslins are broad and effective in drawing and general treatment, and the machine chintzes very superior. The examples, too, of Messrs. J. Burd and Sons (26) are well selected. Some two or three are very superior, being in excellent taste as textile patterns. The small patterns are generally very good, but the furnitures are very heavy. The covering of the front and sides of the contents with a patchwork assortment of the most vulgar-looking furnitures we have lately seen, detracts very much from the real excellence of the dress goods displayed.

GLASGOW.

We question very much if Glasgow can be really said to be fairly represented in the Great Exhibition, so far as the print trade is concerned. It is quite true that there are specimens of all kinds, from the most outrageous of furnitures or pocket-handkerchiefs to the prettiest and most effective of cambrics and muslins. Still, we cannot but think that there are many points which are left unillustrated. As it is, however, whilst there is much to astonish by its ultra-ugliness, there is also much to admire for its intrinsic merit and beauty; and the displays of Messrs. James Black and Co., and Messrs. W. Gourlie and Son, are quite sufficient to redeem the character of the commercial metropolis of Scotland.

Messrs. James Black and Co. (51) exhibit an admirable and extensive collection of muslins, cambrics, mousselines de laine, and barèges, the variety of pattern of which is very great. The chintz effects are excellent, and the colours well selected, being at once brilliant without too great a contrast—a feature of no little moment in producing a satisfactory result. The small patterns are also, in general, very pleasing; in short, the whole display is one of great merit. This house also illustrates, in an ingenious and satisfactory manner, the processes of calico printing, by examples, mounted in two large glazed frames, with succinct and intelligible descriptions of the modes of preparation, printing, and dyeing. A careful examination of these shows the character of the manufacture in a very striking manner.

The exposition of Messrs. W. Gourlie and Son (52) is also a highly creditable one. The muslins and cambrics are well selected in pattern and general character, and the work is very superior. Messrs. John Monteith and Co. (53) exhibit a very first-rate series of examples of the various classes of printed goods, muslins, jaconets, and mixed fabrics. The machine work, as shown here, is of a very superior character. The patterns are generally well selected, though occasionally too much is aimed at.

The Turkey red dyeing and printing of Messrs. Stirlings and Sons (54) are excellent in their style, which is in the extreme of the shawl patterns of India. There is a clearness and distinctness about the details of the "pines" which we should scarcely have thought practicable in such work. The machine furnitures of Messrs. Orr, Ewing, and Co. are worthy of attention, as good examples of their class. But the display of Messrs. H. Monteith and Co. is the most extraordinary one, so far as taste is concerned—handkerchiefs and

SCULPTURED PEDESTAL.—BY J. DRAHE.

SCULPTURED PEDESTAL.—BY J. DRAHE.

furnitures with large and killing effects, occasionally so utterly ugly as to render it a matter of speculation who could be the purchasers of such articles; but being intended for peculiar markets, this is in a measure explained. The mechanical power exhibited in these specimens is very great, and nothing could tend to prove with more effect how much might be achieved by better artistic direction.

The specimens of woodcut printing on silk, exhibited by Messrs. Bradbury, Greatorex, and Beale, in the form of a pocket-handkerchief, do not come within the purpose of our notice; and the ingenious panorama of the progress of the calico print trade, constructed and exhibited by Mr M'Callum, of the Manchester School of Design, was duly noticed in some of our early sketches of the general contents of the department over which we have now gone in detail.

BEDSTEAD. BY ROGERS AND DEAR.

This Bedstead is in the *Renaissance* style, of walnut-tree wood, richly carved, with stuffed panels, covered with quilted satin, and English tapestry hangings. The footboard has a device of the guardian angel watching over a mother and child. All the carving is ably executed, but, according to our notion, there is rather too much of it. The tapestry hangings, also, have too much mixture of colours, the tawdry effect of which is increased by the strong contrast presented by the satin quilting and coverlid. If there be any one article of furniture in which *repose* should be studied, it is surely a bedstead.

SCULPTURED PEDESTAL. BY F. DRAHE, OF BERLIN.

The four Engravings on this page give a representation of the bas-relief on the circular pedestal, by F. Drahe, being a plaster model of that which supports the monument erected by the inhabitants of Berlin to the late King, Frederick William III. It is a pleasing composition, composed of passages of gardens and rural pleasures—as a mother listening to the rippling of a brook; a young man and woman near a well; a boy trying to catch a squirrel which is running up a tree; girls with flowers; others feeding a swan, children at a bird's nest; and, throwing a hallowing sentiment over all, a patriarch resting on his crutch, and smiling benignly at the happy groups which surround him.

MEXICAN FIGURES AND DOLLS. BY MONTANARI.

The beautiful groups of Mexican figures exhibited by Montanari, in the Fine Art Court, daily attract a throng of admiring gazers. They are indeed very interesting, as illustrating town and savage life in Mexico in all their phases. Amongst them the most remarkable are a grotesque figure of an "Aguador" (water-carrier); a "Remendor," or street cobbler, in his ragged attire; "A Confessional," group of three figures; a group of two Indian women dancing a fandango on the green, while the *lepero* is playing on the guitar; scene in the court-yard of a farm, with the wealthy farmer and his lady preparing to ride—the former is in the act of inviting his lady to mount his horse, as is the custom in Mexico; the *Tlachiquero* Indian tasting the *pulque* from the *maguey*, a plant peculiar to the country, which abundantly produces a white liquor, used by the Mexicans as a wholesome beverage, but which, when not diluted, is very intoxicating; a Mexican bull-fight, in six groups; a group of two figures, representing an Indian chief in the act of scalping a white traveller—the savage triumph of the Indian chief singularly contrasts with the horrified despair pourtrayed in the countenance of the traveller; Statuette of Osceola of Florida—this celebrated Chief of the Seminole tribe was the son of a Frenchman; he was remarkable for having carried on a protracted war with the United States, on account of the latter having invaded his territory, but was at last made a prisoner by the Americans, which he did not long survive, having died at Fort Moultrie, Charlestown, South Carolina, of a broken heart. A beautiful group of "Mexican Fruits" (50 in number, natural size) has been recently added to the Mexican collection, forming an interesting feature.

DOLLS.—BY MADAME MONTANARI.

In the North Transept Gallery, Class 29, Case 122, we find a rich display of model wax and rag-dolls, by Madame Montanari. These playthings are indeed very beautifully modelled; the hair inserted into the head, eyelashes, and eyebrows. They represent the different stages of childhood, up to womanhood, and are arranged in the case so as to form interesting family groups. They include portraits of several of the Royal Children. The interior of the case represents a model drawing-room, the model furniture being carved and gilt, and elaborately finished. The model rag-dolls, in an adjoining small glass-case, is a newly-invented article, by Madame Montanari, peculiarly adapted for the nursery, for their softness and durability, and are largely patronized by those who are connoisseurs in doll's-flesh.

GROUP OF SILVER PLATE. BY REID AND SONS.

(*Engraved on page 432.*)

The articles of silver plate exhibited by Reid and Sons, Newcastle-upon-Tyne, are very tasteful in design and beautifully executed. We observe a Coffee-pot and Tea-service, raised in medallions, and richly engraved in bouquet of flowers, in new shaded grounds, a Bread-basket, engraved and pierced, the border composed of three domestic and three wild animals' heads; a Basket, richly chased, for bread or fruit (the handle being moveable), with medallions representing the four seasons; a Claret-jug, richly chased, with medallions of the four quarters of the globe; an oblong or pincushion Dish, with richly ornamented and pierced border, and dome cover, with chased leaves and panels, and handle to suit; an oval Dish, with richly ornamented flower border and panelled dome cover, and melon and vine button; a miniature model of a Coal-waggon, &c.

PORTABLE INDIA-RUBBER SHOWER-BATH &c. BY J. L. HANCOCK.

The bath on page 432, which may be used as a shower or sponging bath, is so constructed that it may be entirely taken asunder; and when folded and packed up, occupies a very small space and weighs but a few pounds. It is, therefore, particularly adapted for use when travelling—a time when of all others a bath is a luxury. This exhibitor also displays an "inflated india-rubber air-proof bed chair," available either as an ordinary air cushion or as a reclining bed or sofa chair, and may be set to any angle; and a "hose reel," for facilitating the binding up and conveying away the patent vulcanized india-rubber garden-hose, when out of use. A somewhat similar contrivance to this is used in many parts of America, in cases of fire, for conveying the hose to the fixed jet pipes established for the purpose in the streets. It occasions far less labour, and is done with much greater speed than attends the conveyance of a heavy fire-engine.

WEDDING-CAKE. BY GUNTER.

(*Engraved on page 432.*)

Mr. Gunter has made a *specialité* of wedding-cakes; no "Marriage in high life" could possibly go off without one. The taste and style displayed in their decoration are well appreciated by those who have been happy enough to partake of them. That in the Great Exhibition is an article of *luxe* which deserves attention almost as a work of art; and in that light we present a Sketch of it.

SCULPTURED PEDESTAL.—BY J. DRAHE.

SCULPTURED PEDESTAL.—BY J. DRAHE.

CUTLERY.—BY MESSRS. MAPPIN, SHEFFIELD.

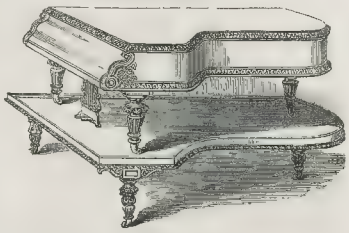
GROUP OF CUTLERY. BY MESSRS. MAPPIN, SHEFFIELD.

Messrs. Mappin make a very interesting display of cutlery of various kinds, evidencing a high degree of excellence in that important branch of national manufactures. We engrave a group of these articles, of which the principal may be described as follows:—Fish Carvers, in silver or electro-plate; a new design, the blade being in the form of a Turkish scimitar, and the handle in the shape of a dolphin. "Lancet-Edge Razors" (registered). These razors are manufactured by a particular process, differing from that previously in use, by which a more perfect and keen edge is produced. Upwards of 100,000, we understand, have been manufactured in three years. Table Knives, in silver or electroplated handles, of the "Grecian pattern"—a novelty of design. Plated or Silver Fruit Dessert Knife, with ivory handles of the "quill pattern" a very neat and chaste design.

GRAND VASE. BY ODIOT.

The vase for the centre of a table, exhibited by Odiot, of which we give an Engraving, is a stately production, in silver, partly bright, partly frosted. The devices on the frieze, vase, and cover are composed of attributes to the God of the Ocean—probably out of compliment to the Ocean Queen, in whose bosom the Great Exposition is held: at any rate, it would be very appropriate as a yacht or race cup, and one of the handsomest things that could be adopted for the purpose.

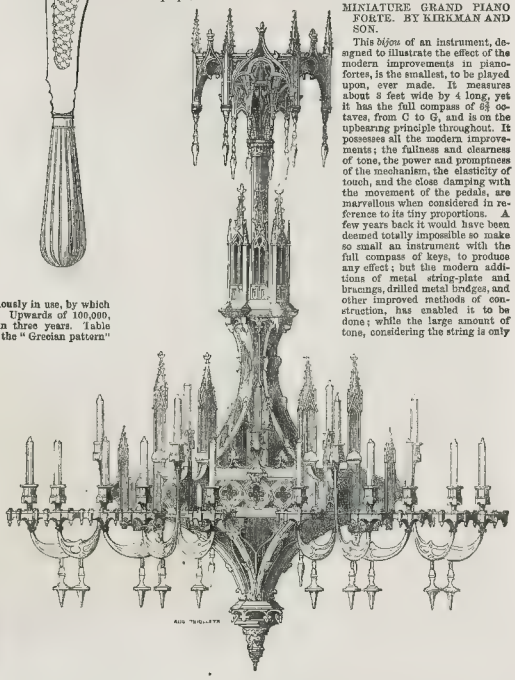
GRAND VASE.—BY ODIOT



MINIATURE GRAND PIANOFORTE.—BY KIRKMAN.

MINIATURE GRAND PIANO FORTE. BY KIRKMAN AND SON.

This *bijou* of an instrument, designed to illustrate the effect of the modern improvements in pianofortes, is the smallest, to be played upon, ever made. It measures about 3 feet wide by 4 long, yet it has the full compass of 6½ octaves, from C to G, and is on the upbearing principle throughout. It possesses all the modern improvements; the fullness and clearness of tone, the power and promptness of the mechanism, the elasticity of touch, and the close damping with the movement of the pedals, are marvellous when considered in reference to its tiny proportions. A few years back it would have been deemed totally impossible so make so small an instrument with the full compass of keys, to produce any effect; but the modern additions of metal string-plate and bracings, drilled metal bridges, and other improved methods of construction, has enabled it to be done; while the large amount of tone, considering the string is only twenty-four inches long, procured in the lower notes, is produced by a treble-spun string, composed of steel, soft iron, and copper wire, made by the aid of a machine recently invented.



CHANDELIER.—FROM FRANCE.

GROUP OF WIGS. BY BROWNE

Our graphic illustrations of the Industry and Wisdom of all Nations would not be complete without a group of Wigs; and we have selected that of Browne, of Fenchurch-street, as one of the most attractive. To those bereaved of Nature's *crowning* blessing, the description of Browne's productions, which we quote from a very learned morning contemporary, cannot but bring comfort: "This exhibitor," the writer states, "displays a splendid collection of specimens of manufactures in human hair, consisting of a dark head-dress for a lady, made entirely transparent throughout, and so constructed that a lady having a thin head of hair can wear it with much comfort; a light head-dress for a lady, the parting made in a very superior manner, to imitate the hair growing from the head, the other transparent; an auburn crop head-dress, representing the hair parted in four divisions, which is said to claim particular attention from the great novelty of its construction, the hair being secured by looping, and also being curled at both ends, shows no roots; a peruke, made on the best principle of ventilation, imparting great comfort to the wearer, with crown and parting, having the hair drawn through goldbeater's skin; a lady's crop head-dress, with crop skin parting, made on the ventilating principle, and with one hair in each mesh of the net; a youth's first-rate peruke, of superior workmanship, made in a machine of improved principle for making stockings, and which bears the name of the 'zephyr wig;' a grey peruke for an elderly person, made peculiarly light and perfectly transparent, having all the roots of the hair taken away."

WIGS—BY BROWNE, FENCHURCH-STREET.

TELEGRAPHS.

The Electric Telegraph is at present in its infancy, and so long as it continues in the hands of one company, as far as England is concerned, so long will the beneficial and civilizing influences which this great boon to mankind is intended eventually to extend be kept in abeyance; although numerically there are now three authorised telegraph companies in this kingdom, yet virtually the public derive their dearly-bought advantages from one only. The Cooke and Wheatstone Telegraph is, in fact, the pet of railway directors; and yet the British Electric Company, and the Magneto-Electric Company, do not seem to take advantage of the underground plan so long since recommended by Mr. Whishaw to be carried out, without touching the railways at all, by means of gutta percha covered wires laid under the old settled turnpike roads. We have written thus much, because we believe that there would have been many more improvements in telegraphs exhibited at the World's Fair, but for the injurious influence of the great telegraph monopoly.

Before noticing the telegraphic contributions, which are arranged in the Middle Gallery North of the Great Palace of Industry, we desire, as we have in some of our communications to the ILLUSTRATED LONDON NEWS on other subjects, to afford our readers as much information as our necessarily circumscribed limits will allow, as to the origin and progress of the electric telegraph.

Du Fay, in France, appears, so early as the year 1733, to have made experiments with regard to the distance to which he could transmit currents of electricity; and this philosopher was followed by Winkler, of Leipsic, who in 1746, produced the first electric telegraph. In Winkler's experiments a Leyden jar was discharged through a single wire, a portion of the river Pleiss being included in the circuit. In the following year, Le Monnier, of Paris, was engaged in similar experiments, and succeeded in passing currents of electricity through a metallic circuit upwards of two miles and a half in extent. Le Monnier's experiments were tested in the same year by Dr. Watson, who suspended two miles of wire along a line of wooden posts at Shooter's-hill, near Blackheath; and it is curious and highly interesting to find that this distinguished man used, in order to complete the circuit, what has by some been supposed to be quite a modern discovery—the earth instead of a return wire; and, notwithstanding this important discovery, the first telegraphers of modern times only resorted to this economical system after laying down the original practical electric telegraph with the circuit entirely of metal. In 1798, a wire was extended, by Betancourt, between Madrid and Aranjuez—a distance of twenty-six miles—for the transmission of shocks from a Leyden jar. Afterwards, the pith ball electrometer was made use of by Lomard

In the present century we find Sömmering the first on the list of telegraph inventors; for, in 1809, he produced an electric telegraph having twenty-five wires for the letters of the alphabet, and ten for the numerals. This mode of sending signals by electricity depended on the decomposition of water under the influence of the voltaic battery. The cost, however, of such an apparatus, was quite sufficient to prevent its coming into practical use.

Francis Ronalds, several years after Sömmering's proposition, patented a more feasible plan of transmitting signals by electricity, and making them available for intelligence; and although quite correct in principle, was too slow in its action. This gentleman, who has since been most usefully engaged in connexion with astronomical observations, used a clock at each of his stations, the dial-plate of which was made to rotate with the seconds arbor: the rotating dial was hid by a metallic plate in front, having an opening at a given point, answering to an index; so that when a given letter came opposite to the opening, it was seen by the operator, who gave a signal by means of the repulsion of pith balls at the other station; and thus the correspondent read off the letter which appeared through the opening on the plate in front of his own instrument. It will be perceived, therefore, that the two dial plates must rotate very accurately in the same times; and, secondly, that only one signal could be given for each rotation of the dial. A great improvement was effected on this description of telegraph by Francis Whishaw, who, in 1845, published his "Electricity applied to Clock and Telegraph." A pair of these instruments was shown for some time in operation at the Society of Arts; they have since been brought forward at one of the Royal Society *soirées*, and on other occasions; and one of them may be seen at the Great Exhibition in the west end of the Clock department, in the Middle Gallery South. In Mr. Wh shaw's instruments, instead of the dial moving, an annular plate surrounding the dial is made to move round by a wheel-and-pinion movement, when required to bring one of the clocks at different stations to uniform time—for on this depends the accuracy in the transmission of signals. On the annular plate are engraved and painted four different alphabets, besides a variety of conventional signals, and which are more rapidly transmitted than by Ronalds' instruments, as the dial plates is turning on the same arbor rotating together. Instead of the pith balls used by Mr Ronalds to indicate the particular signal to be read off, Mr. Whishaw uses what he calls an electrophone, consisting of two bells of dissimilar sound, acted upon by electrical agency. In addition to letters, numerals, and words, whole sentences are transmitted from one station to another with as great facility and as rapidly as a single letter. This important and distinctive part of the invention consists in the application of perforated sheets of cardboard, which are easily fixed up in front of the dials, and as easily removed at pleasure. The perforation, which is circular, allows the hands to be seen in their circular course; and on the electrophonic sounds being transmitted, corresponding sentences, radially placed on each cardboard, are pointed to simultaneously by one or other of the four hands, according to the particular sound or sounds given.

In 1837, a year remarkable for the number of different telegraphs which were brought before the public, we find Alexander, of Edinburgh; Davy, of Fleet-street; Cooke, of Hastings; and Wheatstone, of King's College, all, as it were, electrifying the public with their several beautiful inventions; while, at the same time, Whishaw's hydraulic telegraph created considerable interest in the scientific world, being practically shown in operation at the Adelaide Gallery, and also at the annual conversat of the present Polytechnic Institution. Alexander's instrument, which may be seen in the Telegraph department of the World's Fair, in the Middle Gallery South, was also exhibited at the Adelaide Gallery; while Davy attracted the scientific world to a room in Russell-street, Covent-garden, a warehouse at the St. Katharine's Docks; and Wheatstone to his lecture-room at King's College. This array of telegraphs created naturally a great sensation at the time; the *Times*, in particular, failed not to point the advantage which this country had taken the first in the field, and also its more rapid competitors, which so soon after burst forth on the astonished and delighted visitors to the different points of attraction.

Alexander's invention, though ingenious, possesses the same disadvantage as that of Sömmering, in requiring an individual wire for every letter of the alphabet; it was not likely, therefore, that it would stand any better chance of success than its forerunner; but it is an interesting contribution to this highly important department of the Great Exhibition, as a link in the chain of telegraphic inventions.

Davy's telegraph, instead of only one key, as in the case of Alexander, required eight keys, similar in appearance to those of a pianoforte; the signals were given by moving a needle, to which was attached a screen placed in front of the letters of the alphabet, so that any particular letter might be indicated; the whole was placed in a box, which was artificially lighted, and, as far as we remember, it was necessary to look through a peep-hole in the top of the box. Davy had also a chemical telegraph, which, with his other inventions connected with the subject in later years, found its way into the stores of the "Electric Telegraph Company," who purchased all the patent rights of Messrs. Cooke and Wheatstone; and, although mentioned separately as above, these two inventors in the same field of practical science were fortunately brought together by the advice of their friends; and on the 27th April, 1841, Mr. Brunel and Professor Daniel pointed out, in a document which was freely circulated at the time, the particular relation in which Cooke and Wheatstone stood with regard to the invention of the practical electric telegraph, thus:—

Whilst Mr. Cooke is entitled to stand alone as the gentleman to whom this country is indebted for having practically introduced and carried out the electric telegraph as a useful undertaking promising to be a work of national importance; and Professor Wheatstone is acknowledged as the scientific man whose profound and successful researches had already prepared the public to receive it as a project capable of practical application: it is to the united labours of two gentlemen so well qualified for mutual assistance that we must attribute the rapid progress which this important invention has made during the five years since they have been associated. (Signed) M. I. BRUNEL. J. F. DANIEL.

Although Mr. Cooke certainly brought out the practical needle telegraph, yet it must be acknowledged that the world is indebted to M. Ampère for the suggestion of applying deflected needles by means of voltaic currents with a view to telegraphic communication, so long back as 1820; whereas Mr. Cooke's first patent was not sealed until June, 1837. Mr. Cooke, however, following out Professor Oersted's discovery (1819) of the influence of electric currents in deflecting needles, improved on M. Ampère's application of such discovery; for, instead of using as many needles as there were distinct letters or signals to be given, Mr. Cooke reduced the number of needles to five, requiring, however, as many wires between distant stations, and the same number of return wires, to complete the circuit. In this first plan of Mr. Cooke, the five needles were suspended in front of a lozenge-shaped dial plate, the letters of the alphabet being arranged at the intersection of a number of lines running across the dial at an angle of about 60 degrees. The needles were acted on by the movement of handles, two at a time, which caused the electric current to deflect any two needles on the dial as required, the particular letter intended to be indicated being pointed to simultaneously by the two needles answering the two handles moved. This was evidently a most costly form of telegraph, and it was soon found out by Mr. Cooke, that with two needles he could give the same number of signals as he had in the first instance been able to transmit with five.

Mr. Cooke's first great practical experiment was on the Great Western Railway, between Paddington and West Drayton; and from a paper on the subject, by Francis Whishaw, read before the Society of Arts on the 17th May, 1843, we find that Mr. Cooke at first laid down his wires on the Great Western Railway, six in number, and which were of copper, in 4-inch tubes, varnished within and without; the tubes were covered over by wooden rails, fixed on dwarf posts, driven along the side of the railway. The cost of this system amounted to £287 9s. per mile. The same plan, as regards the wires and tubes, was also adopted by him on the Blackwall line. It was not likely that so expensive a plan of telegraphs would come into general use. It was, therefore, an important step in the invention to reduce the cost per mile to nearly one-half, which Mr. Cooke succeeded in doing, by adopting, after extensive experiments at his own residence, near Blackheath, not a mile from the locale of Dr. Watson's experiments, already alluded to, the above-ground system, which is still persevered in, although its defects are unfortunately too well known; it was quite fair, however, on Mr. Cooke's part, to give it a trial, which took place at the Great Western Railway, between Paddington and Slough. The posts, of timber, were from 16 to 18 feet in length, about 8 inches at bottom, and tapering off to about 6 inches by 7 at top. These posts were fixed at intervals a ong the line of from 500 to 600 yards: at the head of each post was fixed a winding apparatus, for the purpose of drawing up the wires to a proper state of tension; between the winding posts intermediate wooden standards were set up, from 60 to 70 yards apart. The iron wires were of the size known as No. 8, Birmingham wire gauge, and in carrying them by each post they were passed through pieces of quill, well varnished, as the best means of insulation for short lines; but for long lines Mr. Cooke recommended insulators of earthenware or glass—the former of which are now extensively used, not only in Great Britain, but also on some of the European lines of telegraph where the same exposed system is still practised. We have thus shown the two distinct methods of carrying the conducting wires between distant stations, as adopted by Mr. Cooke.

On the dial of the instruments used by Mr. Cooke on the Great Western Railway, having two needles to indicate the letters or numerals to be transmitted, the letter A was placed by itself at top, the convergence of the two needles upwards indicating that letter; then, in a line just below, were the vowels E, I, O, and U, painted as large as the letter A; and at the bottom of the dial were the two letters W and Y. Thus Y was indicated by the movement of the left needle towards that letter, and, by the movement of the same needle to the right; and so on. In like manner, the consonants B, C, &c., were indicated by the movement of the respective needles two or three; and the letters W and Y, and other letters painted in smaller characters, were indicated by the simultaneous movement of the two needles, either once or oftener, according to the particular letter. This arrangement of letters, however, has been altered for some time, although the same principle is adopted of giving signals by Cooke's modern instruments, a more economical method of placing the letters being now universally observed in all the Electric Telegraph Company's instruments. Persons interested in this important subject should apply for permission to inspect the series of working telegraphs at the Company, which is to be found at their temporary office, at the principal entrance of the Crystal Palace.

Messrs. Cooke and Wheatstone took out numerous patents for different kinds of telegraph instruments, and for various modes of protecting the wires, and carrying them from one station to another; and in order to assist our readers who desire to be more minutely acquainted with all the particulars of the several telegraphic inventions of the above firm, we will here give the dates of their respective patents. The first patent was specified on the 12th December, 1837, and was taken out in the name of William Fothergill Cooke, of Hastings, the title being, "For improvements in giving signals and sounding alarms at distant places by means of electricity, and in apparatus for the same." To this circuse Mr. F. Whishaw, who had already entered a caveat for his hydraulic telegraph, received due notice of Mr. Cooke's intention of applying for a patent; nevertheless, he continued for some time to draw the attention of different branches of the Government, as the first railway and assurance companies respectively, and also of the metropolitan police commissioners, to the value of such means of sending communications between the different departments of their respective establishments.

The second patent Messrs. Cooke and Wheatstone was taken out in October, 1838, for improvements in electric telegraphs. In January, 1840, the third patent was taken out for Wheatstone's electro-magnetic telegraph, which was specified on the 21st July of the same year, the apparatus so patented consisting of clock-work acted on by electro-magnets, producing a step by step motion similar to that of the seconds hand of a clock. In this invention we find a signal disc very similar to that of Ronalds, the only difference being that the letters are made to exchange places with the numerals.

This telegraph was, we believe, used on the line of railway at Aix-la-Chapelle, to communicate between the top and bottom of the inclined plane, worked by fixed engines; but in Great Britain we do not find it in practical use. It is worth mentioning, that the wires of this telegraph were carried at the heights about between slender posts, which we have more than once noticed as being in a very tottering condition, the wires having been put up in a very slovenly manner.

In January, 1842, Mr. Wheatstone's electro-magnetic printing telegraph was specified, the specification having been lodged on the 7th of January; and on the 11th of September of the same year Cooke and Wheatstone took out their fifth patent, one of their claims being for the use of the earth to complete the circuit, although we have already mentioned that Dr. Watson had taken this highly important step in the progress of the electric telegraph in 1747, while conducting his experiments at Shooter's-hill. This patent was specified on the 11th of March, 1843.

While Cooke and Wheatstone were busily engaged in improving their different forms of telegraph, and in making experiments with regard to the best mode of laying down and securing the conducting-wires, in England, Dr. O'Shaughnessy, Deputy Assayer to the Hon. East India Company at Calcutta, was carrying on a most extensive series of experiments with a view to ascertain the most suitable form of electric telegraph for India. Perhaps few persons have paid more attention to the highly curious and interesting subject than Dr. O'Shaughnessy; and to him is due the practical carrying out of Dr. Watson's method, now so generally adopted in Great Britain and America, of suspending the conducting-wires in the air from post to post; for, in his experiments made at the Botanic Gardens, Calcutta, in 1839, in order to obtain a sufficient length of conductor to enable him to arrive at "practically valuable results," he had granted to him the use of a plot of ground 450 feet in length by 240 feet in width, on which were set up forty-two lines of bamboo, driven firmly into the ground. In each line there were three bamboos, at nearly equal distances, in height about 8 inches as we now find the telegraph-posts along the lines of railway in our own country, and first adopted by Mr. Cooke on the South-Western Railway some few years after. The lines of wire in the Calcutta experiments were placed in parallel lines, 12 inches apart; in each line of bamboos there was a continuous length of wire of half a mile, first carried in one direction and then in the other—so that the doctor obtained altogether, when the different sections were joined together, 22 miles. Instead of the ordinary earthenware insulators, which are used to prevent contact between the wires and the posts in this country, tar varnish was found to answer the purpose. The only wires which could be readily obtained were of annealed iron of 1-12th inch diameter, which Dr. O'Shaughnessy, however, considered upon the whole the best for the purpose, as being so very inferior to copper; and that if he succeeded with iron wire, he was certain of the superior results from the use of copper. A tent was pitched in front of the whole extent of wire in which the instruments and batteries were placed, and the wires were so arranged that a circuit of from 1 to 22 miles might be obtained for the various experiments entered upon, and tried with different kinds of electro-magnets and a galvanometer.

The results of Dr. O'Shaugnessy's experiments in 1839, with exposed wires, convinced him that whenever the East Indian Government should determine on having the electric telegraph practically introduced to the vast territory of British India, a safer and better mode of conducting the wires from station to station must be adopted than that of exposing them to moisture, even in the driest season, which is "sufficient to stop signals for hours together," whether the moisture be in the form of rain, fog, dew, or even an extreme state of saturation of the air by invisible moisture. Besides the damp, the experimental wires at Calcutta were much injured by the north-west winds; and we have many instances on record in our own country of long lengths of wire being displaced by storms of wind and snow; and the doctor is quite aware that "even in temperate latitudes the effects of atmospheric electrity on the telegraph wires are commonly perplexing, and often most formidable and terrific. In 1848, the same gentleman reported to the Bengal Government as to the introduction of telegraphs into India, and again at the latter end of 1849.

Dr. O'Shaugnessy, in reply to Mr. Whishaw's letter to the late chairman, Sir Archibald Galloway, on an economical plan of laying down telegraphs in India, says, *inter alia*, "The post telegraph is exactly a gigantic apparatus for collecting atmospheric electricity, just such as was employed in Mr. Crosse's famous experiments with lightning in 1838, when he brought the lightning into his study from serene as well as troubled skies; experimented with it and guided it at his pleasure, terrifying the neighbourhood by the constant explosions in his house."

The injury to exposed wires in India, especially from monkeys and large birds, and from the enemy in time of war, is another formidable argument against the adoption of the above-ground system of conducting wires in India. Even in our own country, frequent cases of mischief have been discovered, committed either by malicious persons or for their amusement. In case of sudden disturbances, the whole telegraphic communication of the kingdom would be cut off in less than an hour, and such a catastrophe it would be impossible to prevent, except at the enormous cost of watchmen stationed along the different lines.

(To be Continued.)

THE GREAT GATHERING OF THE INDUSTRIOUS BEES, 1851.

(SECOND NOTICE.)

The inhabitants of Mr. Milton's "mansion of industry," which, with his "Royal Alfred hive," and the "unicomb hive," occupy a large space close to the "wall" of the North Transept Gallery, the whole being enclosed in a large glass case, forming, in fact, a very fine apiary, consist of four swarms of bees, the first of which was hived on the 20th July, 1850; the second and third on the 23d of the same month, and the fourth on the 31st. As hiving the bees after swarming is one of the operations which requires the greatest care and attention on the part of the bee-keeper, it may be as well to mention the mode adopted by Mr. Milton of successfully hiving the four swarms of bees within a few days of each other, and uniting the whole together "without any trouble or fighting about queens;" while this immense population, amounting, according to Mr. Milton's calculation, to 200,000 strong, may be daily seen working harmoniously together, after a residence of nearly four months in their apparently close quarters. The first of these swarms came out about three o'clock on the 20th July, as above, and was immediately secured or hived in a wooden box, which was left in a shady place until eight o'clock in the evening, when it was removed to its intended position. The two swarms which came out on the 23rd July were each hived in a common straw hive, and at 8 o'clock at night a cloth was spread on the ground near to the box-hive, a brick being placed on the cloth, on which to rest one of the sides of the box, for the purpose of admitting the bees into the box. After being tumbled altogether into the cloth by a smart rap on the brick with the edge of the hive, the other swarm was treated precisely in a similar manner; both swarms were speedily underneath the box, which was left undisturbed till the following morning, when it was put back again to its proper position in the apiary. On the 31st of the same month the same operation was performed with the fourth swarm.

The wooden front of the "mansion of industry" is hung on hinges, with representations of windows therein, and with folding doors, by opening which the bees may be seen through the glass partition, leaving the glass sides of the hives at other times free to the quest of honey, or arriving with fresh stores, although at this time (August) they are obliged to have recourse in a great measure, for food, to the honey already collected in their storehouse, as there are but few flowers left in bloom, the Horticultural Gardens continue to draw their supplies. It is much to be regretted, that, owing to some obstacle which Mr. Milton met with in placing his bees, they are pitched at so low a level, that we never pass by this interesting part of the Great Exhibition without feeling anxious for the sake of observing the operations of the industrious bees, which might have been altogether avoided without doing injury to anybody. Those visitors who, from time to time have watched the state of the various working hives in the North Transept Gallery, will have observed that of late there has been a considerable diminution of honey in the above cases.

Contiguous to Milton's mansion of industry, we find his "Royal Alfred hive," named after his Royal Highness Prince Alfred, on whose birthday, the 6th of August, 1845, the first experiment of placing bees within this newly-formed hive was successfully made. The principal novelty in this hive appears to be the inclined floors, by which the bees can easily ascend to any part of the hive, and the dead bees and other refuse, instead of remaining, as on level floors, necessarily fall to the bottom, and are thereby removed. There are, on the two upper sloping compartments, covered over with flaps hung with hinges, three bell glasses in each, which will hold altogether about 18lb. of honey. By means of windows, the whole of the interior can be inspected from time to time, without any fear of disturbing the bees may be fed either at top or in front. In favourable seasons the glasses will be filled in three weeks; and also a second set; and even more than this has been accomplished in one season since the first introduction of the Royal Alfred Hive, in which three sets were working, according to Mr. Milton's calculation, 35,000 bees. The third working hive exhibited by the above-named apiarian is termed the Unicomb Hive, on account of its containing only one comb. It has been used by the celebrated naturalist, Huber, and is constructed in two distinct parts, the lower one being a box of hexagonal shape, with windows and shutters: there are metallic slides on two sides, perforated for the sake of ventilation; on the flat top is a round hole in the centre. Upon this level floor the second or upper part of the hive is cruciform within, so that the bees are compelled to build one uniform comb in each of the divisions of the cross. This upper story is made to revolve, so that any one of the four divisions may readily be brought immediately opposite to the apiarian who desires to examine its contents. Bell shaped glasses are placed above the cross, with proper perforations in the top of the cruciform story. In this hive all the operations of the bees may be watched, owing to its peculiar form, and the queen herself is not free from observation; indeed, her majesty may be taken and removed at any time. This hive may be, in fact, called an experimental hive, as different modes of treatment may be more readily tried than with hives of other shapes; and, according to Mr. Milton, who is no mean authority on this subject, they may be forced to make wax from honey only, and to make honey from sugar.

Having stated the important advantages of this hive, it is fair only to acquaint our readers with its disadvantage, which is the impossibility of the bees clustering together for warmth in the winter season, which they do in other hives, the queen bee continuing within the hive is most desirable, and therefore, in order to render the unicomb hive perfect, the ingenuity of apiarians has yet to be exercised in accomplishing this desideratum. We observed a thermometer within one of the windows standing at 78 deg.

The exhibitor of the hives already described calculates that this unicomb hive also contains 35,000 industrious little labourers; therefore, within the glass apiary at night, belonging to Mr. Milton alone, there are about 200,000 bees! All Mr. Milton's contributions have but one number, 291, Class 9, which include, in addition to those already described—Nunn's patent bar and frame hive, Huber's leaf-hive, Milton's revolving-top hive, and Milton's cottage hive. Nunn's hive is a square box of mahogany, with a sloping cover; the bottom consists of two inclined planes meeting in the middle; the object, no doubt, being the same as that of the "Royal Alfred."

The leaf-hive of Huber, who has been called the father of apiarian science, consists of eight vertical parallel frames, about 10 inches high, 9 inches wide, and 1½ inch thick. These are placed close together,

h being hung with a pair of hinges: there is a glass window at each ; also openings on top for the purpose of drawing off humidity from e interior. Bell glasses may be worked with the Huber hive by acing them above the openings above mentioned; the interior of the re may be readily inspected by the facility of opening the various

Milton's revolving top hive, for which he received the Society of Arts' wer Ceres medal in 1846, already alluded to in the first part of this rtice, consists of a cylindrical case of straw, covered with two boards aving two holes in each, by turning the upper one of which e openings can be closed at pleasure. Bell-shaped glasses are placed the top above the openings, which, when filled, are readily removed, id fresh glasses substituted. Bees are easily hived by this arrangement, ing the glasses to hive from which they are to be removed on the revolving oard, taking care to leave only one opening, and the bees will severally scend into their new habitation without any trouble, the lower hive ng prepared for their reception by washing its interior walls with a xture of sugar and beer, or other suitable sweet liquor.

Milton's cottage hive improved consists of a cylindrical box of straw, sting on a circular board, having a sunk and inclined way from the ojecting landing-place in front, so that the bees may enter or leave the ve at pleasure. On the top of the lower compartment is a circular oard, with an opening in the middle: this board serves for a floor to ceive a small hive or cap above, which is also of straw. This form of ive is especially calculated for the use of the poorer classes of apiarians, n account of its simplicity, and the comparatively small cost at which may be obtained.

Besides the beautiful apiarian exposition which we have already described, we find, tastefully arranged under a large bell glass, six specimens of honey in smaller glasses, including a solid piece of spring honey, a solid piece of summer honey, from lime trees, a piece of cottager's oney, and specimens taken from a cottage hive at Great Marlow.

Finally, Mr. Milton exhibits a most curious production, in the shape f an embalmed swarm of bees suspended from a twisted branch, inside bell glass. A label informs the visitors that the bee-keeper has "embalmed the mother of industry, together with a population 10,000 rong;" and each individual subject has passed through his hands six ms.

The next apiarian exhibitor is Mr. Neighbour, whose apiary is very ear to that of Mr. Milton. It consists of a large glass case, with parts f the sides covered with perforated zinc, for the sake of ventilation. his apiary also contains three hives: first, Neighbour's ventilating box-ive, from Mr. Appleyard's apiary, Harrow Weald, containing from 5,000 to 20,000 bees, which were hived on the 30th April of the present ar, the day before that of the opening of the Great Exhibition; eighbour's observatory glass hive, containing about the same number s the box-hive; and a two-storied square box-hive, with sloping roof. From this latter, however, the bees decamped within a week after they had been hived, owing to some disturbance, or perhaps to the dislike taken by the bees to their new habitation. The ventilating box-hives, in hape, square, having windows and shutters, the shutters being hung at bottom. The entrance is at the back, enabling the bees, as in the case of Mr. Milton's working-hives, to go to Kensington-gardens, or other esort, when they please. In front, at bottom, is a long door hung with inges, so that all dead bees and refuse may be easily cleared away. By means of a perforated metal slide in the floor, ventilation, which some apiarians loudly contend for, is effected. Above the wooden box is placed a bell glass, into which the bees ascend to work by means of a circular opening in the top of the square box. On the top of the bell glass is an aperture through which is inserted a tubular trunk of perforated zinc to take off the moisture from within. The observatory hive is of glass, with a superior crystal compartment, an opening being formed between the two; the bees, but few in number, are at present forming comb in the upper glass, which affords a very interesting sight, as, generally speaking, the bees are in such a cluster when at work that one can scarcely view their mathematically formed cells. A straw cover is suspended over the upper compartment by a rope over a pulley, which cover is raised up by the attendant at pleasure. The larger or bottom compartment rests on a wooden floor, which has a circular sinking therein to receive the bell glass. A landing-place projecting, as usual, with sunken way, to enable the bees to pass in and out of their habitation, completes this contrivance.

In addition to Mr. Neighbour's crystal apiary, he also exhibits a cottager's straw hive, a model of Mr. Appleyard's apiary at Harrow Weald, Taylor's amateur bee hive, a glass hive, Nutt's patent collateral hive, the ladies' observatory hive, a model of Mr. Ley's improved cottage hive, and Payne's cottage hive.

The cottager's hive is simply that of the form we find in use in most parts of the country, where the industrious cottagers or their wives, by a little attention to their interesting little labourers, are enabled to add considerably to their usually scanty earnings. This kind of hive is usually made of straw resting on a circular wooden board, with part of the board or floor projecting in front as a landing-place for the bees, which enter under the edge of the straw by means of a sinking in the floor.

Mr. Appleyard's apiary next attracts our attention. It consists of a wooden lean-to building, with the eaves at the back, the front and sides being of close boarding, and the floor standing on four square wooden legs. In front, just above the floor, for the whole length is left an opening by which the bees can approach or leave the different hives, which are ranged along the floor. At the back of the apiary are sliding doors, to enable the bee-keeper to examine any particular hive without disturbing the rest, which he would do if the doors were in front. From what we have already said of Mr. Espinasse's apiary in the first part of this paper, it will be seen that the construction is precisely similar to that which, after eighteen years experience, Mr. Espinasse found to answer so well.

Taylor's amateur's bee-hive consists of three small square boxes, one above another, with a roof over the top story; the ventilation being effected by perforations under the eaves: each side, of every story has a window and shutter. The landing-place is in front of the bottom story, and the entrance to the hive, is a long slit about $\frac{1}{2}$ inch high.

The hive is similar to that in which the bees are at work in Mr. Neighbour's apiary already mentioned; but, on account of the large number of bees at work therein, and the extent of comb already effected, the interior perches cannot be seen. These wooden perches are arranged the interior perches cannot be seen. These wooden perches are arranged in a square, leaving a space next the glass all round, the whole being framed together with a bar at right angles, and resting on an upright support in the middle.

Nutt's patent collateral hive consists of three square compartments, placed side by side, with an elevated octagonal second story in the middle. Between the lower compartments are introduced, for the sake of ventilation, perforated slides of zinc. At each end of the lower tier of compartments is a window with outside shutter hung round hinges: tubular perforated zinc ventilators are introduced through the top of each of the side compartments; these tubes are furnished with conical ends of the same material. The elevated dome may be examined as well as the lower boxes, as it is furnished with four small windows and outside shutters, to close up the whole, in order not to disturb the bees more than necessary.

Ladies' observatory hive. This is merely a straw hive, with opening in the top, having sliding metallic ventilator: by removing the top the interior may be inspected.

Mr. Appleyard's box hive is square, with windows and outside shutters: in the top are perforations covered with zinc slides, when not required to be left open for bell glasses. In order to clean out the refuse from the hive there is a long door at bottom, and for the sake of ventilation a few bottom of perforated zinc just above the level of the top of the cleaning-out door is introduced.

The improved cottage hive of the same exhibitor consists of a straw circular lower compartment, having windows and outside shutters. A perforated zinc plate is placed just inside one of the windows. The base plate or floor is of wood, with a landing-place and sunken way, as already mentioned in some of the other hives. In the top, which is also of wood, are three circular perforations, each of about two inches diameter, above which are placed as many bell glasses. There is a small hole in the top of each of the glasses, through which a perforated tubular trunk is inserted, for the sake of taking off the moisture from the interior of the hive. Within the glass is a feeding-trough of zinc, circular in shape, with a floating cork, on which the bees alight, and in the winter season regale themselves with the honey which is found in the various perforations, as it floats up to the level of the honey contained in the small filling-trough, through which the honey, or beer and sugar, is poured into the trough. The glasses are covered with a straw cap, removable at pleasure.

Payne's cottage hive consists of two straw hives, one above the other, the lower one being considerably larger than that above. The two are separated by two mahogany boards, with circular openings therein. The upper compartment is furnished with a window and zinc perforated sliding door; the whole standing on a wooden board of circular shape, with projecting landing-place and sunken way in front.

Messrs. Neighbour's contributions are completed with tin perforated fumigators, by the use of which the bees are stupified for awhile, when required to be moved from one hive to another; and specimens of honey and honeycomb of the season 1850. The number attached to the deposits of Neighbour and Son is 260, Class 1.

We must now quit the North Transept gallery, in order to examine the rest of the hives contributed by British apiarian exhibitors, and which are scattered about in the Agricultural Implement department, Class 9. The names of these exhibitors are Golding, Phillips, Wood, Pettit, Istance, Briggs, J. Sholl, Pondre, Keene, Hayes, Nunn, Marriott, Rowbottom, and Jones. We shall take them in the numerical order in which they are named in the official Catalogue. Beginning, therefore, with No. 45, R. Golding, of Hunton, near Maidstone, who contributes a "Leadclive," on Huber's construction, "as constructed to get the comb of wedge shape," as each comb depends from the top of one of the leaves, and thus room is left between the different combs for the bees to work in, and pass from one part of their work to another. The novelty in this hive consists in the shifting brass butt hinges, so that each leaf deposit seems to be the shifting brass butt hinges, so that each leaf deposit seems to be the shifting brass butt hinges, so that each leaf deposit seems to be the shifting brass butt hinges, so that each leaf deposit seems to be the facilities afforded by the hive last described.

72A. G. Phillips, of Harrow-on-the-hill, which, by the way, appears to be a famous locality for bees, contributes his improved collateral hive, which is very similar to that of Nutt, already described as exhibited by Neighbour; and, if we mistake not, we saw a counterpart of this contrivance at the Society of Arts Apiarian Exposition, already mentioned.

90. G. Wood, of Alnwick, Northumberland, exhibits what he calls his improved cottage-hive; but the features of it are so very similar to those of others already described, that we are at a loss to know why inventions so very similar should have been permitted to occupy valuable space in the Exhibition, many persons having useful and valuable inventions which were refused admission. The lower part of Wood's hive is of straw, and circular, with a dividing-board, having an opening as usual; the upper compartment being of wood, and in shape square, fitted with windows and outside shutters.

92. W. J. Pettit, of Sudbury, Suffolk, contributes temple and collateral hives; but at present we have not found their whereabouts.

1 to 8. Istance, of Carmarthen, South Wales, contributes a ventilator for bee-hives. We have already mentioned many ventilators, for which see Neighbour and Son's contributions are famous.

10. T. Briggs, of Danby Pottery, Derbyshire, has sent the model of an ornamental Gothic cottage, with roof covered with zinc, intended as the casing for a straw hive within, which can be removed by lifting off the roof. The entrance is under the step of the door, and a landing-place projects in front thereof. The whole is placed on a stand, to keep the hive sufficiently above the ground.

A feeding trough, of wood, somewhat similar to those exhibited by Mr. Neighbour, is also exhibited by Mr. T. Briggs.

136. J. Sholl, whose father's bee-castle was located in the balcony of the house of the Society of Arts, for several weeks of the season of 1843, contributes a castle hive, an observatory hive, and fine specimens of honey taken from the latter. The exhibitor calls the first-mentioned "Prince Albert's Hive," in honour of that illustrious person, who ordered one or more of Sholl's bee-castles for the Royal farm at Windsor, in 1843—having, after the distribution of the rewards of the Society of Arts in June of that year, examined minutely that placed in the Adelphi balcony, as already mentioned.

The castle hive, designed and manufactured by the Sholls, consists of a castellated octagonal box, in three storeys, with floors perforated to admit the bees into bell glasses, removable at pleasure, as in the case of other hives already described. In the lower part of one side of the hive is a perforated zinc ventilator; and the entrance is covered over with a curved plate of zinc, formed with indents or openings, each sufficiently large to admit one bee at a time. The whole is fixed on a four-legged stand.

The Observatory Hive is circular in plan, and constructed of zinc, in two stories, with a thin interior lining of wood. The upper compartment, which is of smaller diameter than the lower one, contains the bell glasses, which are placed on the perforated floor, having a square of glass let into it, for the purpose of inspection of the internal operations of the inhabitants. The entrance in the lower compartment has a penthouse over it, with an inclined landing-place. The whole is completed by a shallow drawer at bottom, by which the refuse of the hive is easily removed.

The same exhibitor has imported bees from his apiary at Burlington, New Jersey, U.S., and placed them in boxes at the east end of the Building, in the United States territory, with openings to and from the hives to enable the bees to collect what honey they may find in Kensington Gardens and elsewhere. Having, however, applied to the United States authorities for information on the subject of these American bees, but without success, for the secretary declared he knew nothing about them, and, moreover, that he had not visited the hives inside the Building, we are unable to report progress with regard to the work performed by the transatlantic little visitors attracted to the great gathering of their species in the Crystal Palace. It is to be hoped, that, if Paxton's winter garden is carried out, our agricultural friend will not be forgotten in the general arrangement. We may as well mention here, that J. Sholl is the only contributor of bees, hives, or honey in the United States department; but we must return to the other British hives in the Agricultural Implement department.

146. W. R. Pondre, of Goldhanger, near Malden, Essex, exhibits his bee-house or apiary, of wood, having eight windows, with outside shutters, the whole divided into three compartments, with three small semicircular entrances and landing-places. By means of a false bottom and zinc slides, the refuse of the apiary is easily removed.

193. W. Keene, of Cornhill, has sent a box-hive in three compartments, one over the other, with inclined landings all round.

208A. Mr. Hayes, of Enfield Highway, contributes a wooden bee-box, standing on four legs: the lower compartment is about six inches high and has a covered entry with inclined landing in front. In the floor above the lower story, are openings with slides which can be moved in and out at pleasure from without. Bell glasses are placed over the several openings. In the middle of the upper compartment is a straw square hive with a feeding apparatus in the top, of wood, instead of zinc as ordinarily constructed. The top is of zinc, and ornamented; and being hung with hinges, is easily raised, so that the interior of the house may be examined.

219. Messrs. Nunn, of Stratford-place, exhibit rather a novelty in apiarian matters, in the shape of what may be called a bee net; consisting of a cylindrical straw box, open at bottom and having flat cover perforated in middle: this net is suspended between two prongs of a large fork, having a long handle. The object of this contrivance is to secure a swarm of bees by placing the net over them, without approaching too near to their temporary settlement; although we hear from an experienced bee-keeper that at such times the bees are so glad to be hived that you may safely take a handful at a time and put them into their new home. The weight of this contrivance appears to be very much against it coming into use, even if required at all.

243. J. Marriott, of Gracechurch-street, contributes his "new bee-hive," which consists of straw on a wooden hoop foundation. It is fitted with windows for inspection of the interior, having outside shutters: a second hive is placed at top, fitting closely to the lower one, surmounted with a cupola. In the upper compartment are three bell glasses, standing over as many apertures in the floor which divides the upper from the lower compartment. A thermometer is placed in the lower apartment. Mr. Marriott is evidently an enthusiastic bee-keeper, as may be gathered from various labels appended to his hives, such as the following:—"The working bees serve their queen in everything; they clean her, and cluster about her to keep her warm; when their food is almost spent, they will starve and die to keep her alive."

The same exhibitor shows another hive, on the same principle, but constructed chiefly of wood, the top, which can be taken off as pleasure, is of flat segmental shape; underneath the projection of the roof, all round, are small openings for ventilation; the floor between the upper and lower compartments is also of metal, and projects considerably beyond the sides; within the top compartment is a large glass, with opening at top for ventilation.

Another collateral hive is shown also by Mr. Marriott, who also has in his collection a portion of prepared fungus, with which to fumigate the hive when necessary; a hexagon feeding-trough, on the same principle as that of Neighbour; a tubular perforated zinc ventilator; several fine specimens of honey, granulated, clarified, and virgin; also, finished and unfinished honeycomb. Finally, the collection of Mr. Marriott is completed by specimens of two queen-bees, three drones, and eight working bees; as also of royal or queen-bees' cells, which are so much larger than the ordinary cells. We recommend all admirers of the apiarian race to *find out* Mr. Marriott's collection.

263 B. J. Rowbotham, of Halifax, has produced an exceedingly neat, and, indeed, ornamental-looking hive, the regular straw being bound with whalebone. This hive is surmounted by a second hive, with an opening between the two. There is a landing-place and sunk and inclined way to entrance. The frame of this hive is handsomely carved and gilt, and is, indeed, fit for a Royal apiary.

283. The Rev. C. E. Jones contributes "the cottagers' double bee-hive, with regulating doorway in the floor board;" also, "a rim for enlarging the hive." In summer two hives are placed apart from each other; but at other times placed together, and a communication formed between the two. The rim is merely to increase the size of the hive at bottom in case of emergency.

We now ascend to the South Gallery; and in Class 3, among "Substances used for food," we find five exhibitors of honey, whose numbers are respectively 1, 2, 4, 5, and 7.

No. 1. J. Leighton, of Frampton, near Boston, Lincolnshire, has sent a glass of virgin honey in comb, weighing 19 lb., which he says has been produced under a new system," but leaves us in the dark as to what that system is.

No. 2. H. Doubleday, of Coggeshall, Essex, also sends a fine specimen of honey-comb.

No. 4. J. E. Bentley, of Stamford, contributes specimens of honey in the comb, free from pollen and brood cells, collected under Nutt's system, which we have already mentioned

No. 5. W. C. Kitchener, of Newmarket, shows two specimens of honey, as also "apparatus for obtaining honey without impurity," which is merely the bell glass, which we find in every modern hive, and which in the course of these notices we have so often alluded to.

No. 55. Fortnum, Mason, and Co., of Piccadilly, contribute several specimens of honey from different parts of the world; thus we find the "Highland heather" honey, from Scotland; a fine specimen of English honey; "rosemary," from Spain; honey from Chamouny, Switzerland; Minorca, Narbonne, France, and Malta.

Thus we have completed an account of the apiarian contributions in the first and principal half of the Exhibition, and need not dwell at length on the foreign contributions and those from our colonial possessions, as they consist chiefly of specimens of honey, without any information as to the food from which the various samples have been produced.

From India we have "bill honey," from Calcutta, marked R 409, included in the collection transmitted from the East India Company's dispensary at Calcutta; also, another sample, in stone jar, from Coorg; and a third, without name, numbered 243 (in the Indian collection).

From the Cape of Good Hope, J. G. Joubert, (No. 52, official Catalogue) contributes six bottles of honey of delicate colour.

From Canada, H. Lynam (No. 131) exhibits four bottles of honey; and J. Parissault, of St. Martin (No. 129) samples of bee's-wax.

From British Guiana, J. F. Bee (No. 120) contributes samples of honey from Plantation Woodlands, river Mahaica.

From Van Diemen's Land, W. Rout (No. 231 and No. 293) has sent to the Exhibition specimens of Tasmanian honey and bee's-wax. And, as we at last find some information on the subject of bees in the Official Catalogue," we will make the most of it, and copy it verbatim:—"In no country in the world do bees thrive better than in Van Diemen's Land, or prove so productive with a trifling amount of attention—circumstances clear, no doubt, to the mildness of the winter season, and the fact of many Tasmanian plants blooming throughout the winter months. The bee has now become naturalized in the forests, and many of the hollow trees are filled with the produce of their labour."

From the Carniolian Agricultural Society of Laibach, Austria (No. 70), we find honey collected by the bees from the blossoms of buck-wheat. Honey of this kind is known to possess a very peculiar flavour. Owing to the imperfect manner in which it has been sent, the honey is escaping from the box in which it is contained.

M. M. Debeurvois, who is a physician at Selches, in the department of Maine et Loire, France, has for many years paid great attention to apiarian pursuits, and after many experiments has introduced two different forms of hives, which are entirely of a novel character: models of these are exhibited in the French department in the passage leading to the Exhibitors' Refreshment Rooms, and we strongly recommend English bee-keepers to examine these hives for themselves. The first consists of a bee box, with sloping top on either side, from which rises a double hollow, with a vertical box in the middle, and four sloping lateral boxes, the whole standing on three bars being towards the sides of the frame: thus all refuse falls down the inclines to the bottom. The combs are formed between the two sashes, and each suspended to one of the bars. The second is a very complex observatory hive, by the aid of the whole of the operations of the workers and the queen may at any time be inspected; and by opening one side of the glazed enclosure, the comb may be readily removed when required.

We cannot help quoting the following from the exhibitor's prospectus, which is printed in French, English, and German:—"The principal advantages consist in being by these means enabled to remove the honey and the wax from the hive without driving away or destroying the bees, and to conserve also their eggs, preventing at the same time the entire destruction of the honorable personnel, and, lastly, to protect the bees against hybrid vermin, fabricated by, which are their most dangerous enemies."

The second form of hive which M. Debeurvois has found to answer is made up of a series of leaves, according to Huber's notion, but which are included, as the bars of the model already described: any leaf may be removed at the top without disturbing the rest. The cost of either of the hives which we have attempted to describe must be inconsiderable, as, in the former case, the materials are but plain deal and glass, and in the latter case, deal only. Of course, they could both be made more ornamental, if desired.

In addition to the above, we found a straw hive, standing on a deal board or floor, the top being furnished with deal bars across it like a grating, on which one transverse piece to secure the whole together. We have already described an English hive on this construction. (Golding, No. 45, Class 1).

153. Damainville, of Pondron, near Cressy (Oise), contributes artificial honeycombs, for feeding bees: the cells, made of wax, to imitate nature as near as possible, are arranged in a circle of about 6 or 7 inches diameter, and not very deep. It might be worth while for our apiarians to glance at this invention, as it may, perhaps, answer better than the feeding-troughs we have already described.

156. Messrs. Chaillou-Lepage, and Pochon, breeders of bees at Poiseaux (Loiret), contribute a small cask of very palatable honey. By the way, it would not be a bad plan for the contributors of such nice productions to bring them forward on the 15th October next, in order to obtain a mass of evidence as to the qualities of the different articles. No doubt, Jacob Perkins would produce some of his monster loaves by his steam oven in the American department on that occasion. It would also afford a rare opportunity of testing the cutlery, both British and foreign; and also of showing forth the best specimens of china plates and dishes.

1640. Laugier, of Ongle (Basses Alpes), contributes honey, and also wax.

From Greece we have, first, "a jar of honey, from Mount Hymettus," contributed by A. Tsitsimbakos, of Athens (No. 13); and, from the same, a sample of honey in the comb; and the Bishop of Eubœa, of Carysto, Eubœa, as producer, has sent a jar of Carysto honey, called rhodomeli

From Portugal (Nos. 593 and 594), we have samples of honey respectively from T. P. de Maltos; 595, from Castello Bianco; 596, from the Marquis de Ficalho; 597, from Bragança; and 598, from Evora.

From Spain we have various specimens of honey. The first in numerical order is virgin honey, of Ciudad Real (180); the sample sent is from El Moral de Calatrava: 181, honey from orange flowers, sent by M. Abad, of Cordova: 182, honey in the comb, and clarified, from F. Colmenero, of Guadalajara; 183 and 184, honey in the comb, from C. Escudero and Centenera, of the same place; and 185, honey from orange flowers, from J. M. Benjumes, of Seville.

From Switzerland we only find one apiarian contribution, which is numbered 71, and consists of two straw hives, the sides being flatter than those made and used in England.

From Tunis (153) four jugs of honey, without any information; and (163) four jugs of honeycombs.

From Turkey, samples of common and wild honey; and, generally, from Egypt, we find specimens of the white honey of Mantoursah, and honeycomb from Mehaleeh.

It is much to be regretted, that, with the various samples of honey contributed from so many parts of the world, there should be, with one or two exceptions, no description of the flowers from which the honey has been produced.

With regard to wax, we might have enlarged this communication to great length, owing to the number of truly beautiful articles in the Great Exhibition produced from that useful commodity; but we need only refer our friends who have not already seen it, to an article on wax-work, by "S. B.," in No. 611 of the ILLUSTRATED LONDON NEWS, which will enlighten them on this very interesting subject.

THE CRYSTAL PALACE.—THE

AVENUE, LOOKING EAST.

BRITISH SILK MANUFACTURES.

It would be no easy matter to depict the forebodings with which the silk manufacturers of this country regarded the proposition to hold an Exhibition of the Works of Industry of all Nations. No class of manufacturers were ever so utterly prostrated as these gentlemen appeared to be when the proposition was first made to them; and it was only from finding that the thing was inevitable, that they at last appeared to set to work, in order to do something at least that should show that fear had not altogether deprived them of all enterprise; and so, at a late period, they made up their minds that it would be desirable to do something, however little that might be, in order to show that Free-trade had not quite annihilated their business. This may, in a measure, account for the comparative insignificance of the display of English silks, as made by the ancient seat of the manufacture in England, Spitalfields; a rise at one period there did not appear to be the slightest indication that more than two or three of the manufacturers of that locality would exhibit anything; and it was only by the urgent efforts of these few, that the rest were induced to try what they could do. Whether it was the fear of offending the shopkeeper, by exposing the source whence the more elegant of the cheap *French* silks were derived, or whether it was that indefinite yearning after exclusiveness, with its various acts and monopolies, which have hitherto tended to keep them down in the race of improvement, it would be hard to say; but it is certain that the anxiety which was displayed during the arrangements, to get every inch of space that could be obtained, was only a new-born feeling arising out of the pressure of circumstances over which they had no control. It will be sufficient, however, for us now to say, that the silk trade of Spitalfields has not been altogether annihilated by the Exhibition; and that, in spite of fashionable prejudices and "good old opinions," the manufacturers of that district have come out of this comparison or competition with quite as much honour as was to be expected, considering their apathy and long habit of neglecting all improvement until it is forced upon them. A few spirited individuals have, doubtlessly, made efforts of a highly creditable character, and to these credit is certainly due for their exertions.

We shall not attempt to enter into any history of the silk manufacture in this country, nor say anything about the nature and character of the raw material, a subject of great interest and more than ordinary value. If time permit, this may be done when noticing the foreign productions in silk. It will be sufficient, then, for our present purpose, if we take the groups of exhibitors of manufactured silks, and endeavour to call attention to the leading merits and features of their individual display.

SPITALFIELDS.

The exposition of Spitalfields manufactures is as much owing to those who sell the silk, probably more, than to those who make it; and, in some instances, the manufacturer not only exhibits certain patterns himself, but they are also exhibited by those whose only province it is to sell them.

The leading feature of the silk department on the British side is the trophy of Messrs Keith and Co., 124, Wood-street, erected in the central avenue, of which we gave an Illustration at an early period of the Exhibition. The patterns for furniture damasks here displayed are very various, alike in merit as in effect. Some are very superior, others by no means up to the mark in point of taste. The brocatelles are generally good; one in particular is noticeable for the admirable character of the ornament, and the contrast between the satin and the twill of the figure. This is a bold and effective design. There is a Gothic pattern, however, of a very objectionable character, since it has no reference whatever to Mediæval textile design, and is simply a reproduction of forms used for wood, stone, or iron, instead of partaking of the diaper character of a true Gothic textile. Some of the specimens with chené effects are good, but others require more distinctness of detail to render them suitable for furnitures. The smaller damask patterns are generally good and effective: one with a bouquet of flowers in an ornamental trellis ground is admirable, both in drawing and weaving. On the whole, the spirit and energy displayed by Messrs. Keith and Co., both in the production and in the display of their goods, is worthy of commendation. The show of silk velvets in one portion of the trophy should not be overlooked.

Ascending to the gallery overlooking this trophy, the group of Spitalfields, or perhaps we should say metropolitan, exhibitors of silk manufacture are located—the glass cases being ingeniously contrived, so as to give the largest possible amount of surface within the smallest possible space, in this respect making a great contrast with the modes of display adopted in the French department. In short, many of the arrangements in the gallery on the British side were much injured in their effect by absurd regulations as to the height of erections, which regulations were not enforced on the foreign side, thus placing many of the exhibitors at a great disadvantage in the arrangement of their goods; and the limits within which some of the silks goods are confined is positively ridiculous, there not being room fairly to open the goods.

Messrs. Redmayne and Co., New Bond-street (1A), show very elegant spotted examples of glacé silk, manufactured by Stone and Kemp; as also a garniture ribbon, light and free in design. Messrs. Sanderson and Reid (3), and Messrs. J. Vanner and Son (4), exhibit articles which display more labour than taste. Messrs. J. and R. Robinson and Co., Milk-street, make an exceedingly tasteful display, and in many examples there is great elegance in design. The *Victoria regia*, quite a rage just now for the decoration of everything, from hearth-rugs to pocket-handkerchiefs, is here well treated, and the effect is very successful. The memento of the Exhibition, with Prince Albert's cipher and motto, is clever in its adaptation. The velvets are rich in colour and finish. Messrs. Washington and Co., also of Milk-street (6), exhibit imitations of furs of a novel and effective character. The figured examples are less tasteful than the others

Mr. J. Duthoit, Spitalfields (12), exhibits good specimens of weaving, but the designs are quite *à la* Spitalfields—spotty and crude.

Mr. Isaac Boyd, Spital-square (13), shows moiré, antique, and glacé silks, very elegant and effective, the figured examples being very rich in effect. The furniture damask is bold, but the effect is rather crude.

The magnificent specimen of brocaded silk exhibited by Messrs. Lewis and Allenby, and manufactured for them by Messrs. Campbell, Harrison, and Lloyd, is a remarkable example of what can be done by our weavers, if we do but encourage them. The cost of this production must have been very great, but the result is quite worthy of the outlay. It is artistic in its treatment, and a bold attempt to show what can be done, even in England, in a higher style of weaving. About 30,000 cards and 100 shuttles were used in the making of this example, the breadth of which is not one of its least noticeable features. Messrs. Stone and Kemp, Spital-square (18), also make an elegant and effective display. The brocades are all of a good class in design, and the execution unexceptionable. The chinés are not so good, being wanting in colour and distinctness.

The figured damasks exhibited by Messrs. Sewell and Co. (19), also manufactured by Messrs Campbell, Harrison, and Lloyd, are very rich and effective. The plain moiré antique silks are of a very superior character. Mrs. Jane Clark, Regent-street, shows specimens of rainbow coloured silks of an exceedingly elegant appearance. The prismatic effect is novel, and the lustrous appearance of the surface very beautiful. Messrs. Le Mair and Sons (21), and Messrs. Casey and Phillips, Spital-square (23), exhibit specimens of excellent manufacture, chiefly black and velvet. Messrs. J. W. Robinson, Milk-street (24), and Messrs. James Hill and Co., Spital-square (25), each make a good exposition of their respective productions. The figured examples of the latter are pretty, elegant, and effective. The drawing and design of several are excellent. The satins, *gros de Naples*, and silk velvets shown by Mr. Thomas Brooks, Spital-square (26), are very beautiful; the dyes being especially noticeable. Messrs. Howell, James, and Co., Regent-street (27), show examples characterised by great boldness and effect, rather than elegance, although this latter quality is by no means absent.

The names of Messrs Campbell, Harrison, and Lloyd have been quoted as the manufacturers of several examples of a very high class, and they have "paled their own fires" in order to give force to the more important commercial question of pleasing their customers. The specimens exhibited, however, are certainly of a very high character, and fully worthy of their reputation; and these are all manufactured for houses which do not exhibit. There needs no better proof than these specimens furnish to show what can be done by our native workers, if we do but depend upon ourselves, and not be frightened from our propriety by nonsensical fears about incapacity in taste, and so forth, when we have never done that which we ought to have done long ago—encouraged those around us to do their best.
